Subsidies for Whom?

An exercise in estimating the size and composition of government subsidies in 1987-88, after costing government services on a user charge basis, shows that no less than 15 per cent of GDP is being distributed in the form of subsidies, that much of these subsidies are invisible and that it is not at all clear that the subsidies are flowing to the intended beneficiaries. 1157

Political Identities

Four basic issues have been instrumental in mobilising the tribal people of Jharkhand to raise their voice against subordination and injustice—land and forest alienation, immigration into the region, threat to the tribals' cultural identity and underdevelopment 1173

Though the backward castes constitute nearly 60 per cent of the electorate in Bihar, they were not politically significant till the mid-seventies. The turning point in the political organisation of these castes came in 1977 when reservation for backward castes in government service was introduced. 1142

Towards Planlessness

The air of uncertainty and purposelessness pervading Yojana Bhavan is palpable. The position is worse than that at the close of the Third Plan when the launching of the Fourth Plan had been stalled. However, the decision to go in for a three-year plan holiday in the mid-sixties was a deliberate one, whereas what we have today is a mindless drift into planlessness. 1140

Helping Hand

It is a new development, mobilising the international loan-giving agencies for electoral campaign within the country. The message could not have been more explicitly stated, unless you vote right, unless you vote for a stable single-party regime—you know which one—these international institutions will stay away and offer no loans to bail you out. 1130

Plan that Was

A look at the financing of the Eighth Plan as worked out by the erstwhile planning commission under the V P Singh government: the pattern of financing, the broad thrust of the expenditure allocations and the extent of devolution of resources for bringing about a directional change in the pattern of development. 1132

Gender and the Left

On all the major issues facing the women's movement, the CPI(M) and the Left parties have taken unambiguous pro-woman positions. However, these positions have been prompted by a particular understanding of the 'gender question' which seeks to find its roots not in the male-female contradiction or male attitudes but in the development of a class society and locates its specificity in wider socio-economic realities. 111

Gandhi and Ambedkar

Gandhi and Ambedkar ended in a state of near-total confrontation, rather than dialogue, and it is important to understand how this happened. 1154

Toning Up the System

Press reports on the report of the World Bank staff team on India's financial system have tended to be sensational. While the report favours eventual privatisation of the financial system, that is not its central theme. Greater efficiency and flexibility are the keys to reform and privatisation is seen as a means to promote them 'in the long run'. 1145

The Other War

The US-led Western states not only won the Gulf war, but the parallel information game as well because of their monopoly over information. 1147

LETTERS TO EDITOR

MOU System and Public Enterprises

THIS is with reference to the article 'Eighth Plan: Challenges and Possibilities—VII, Industry: The Policy Framework' by Arun Ghosh (March 2-9). While discussing the role of the public sector in the Indian economy, Ghosh has written about the introduction of the MOU system of performance evaluation in Central public sector enterprises and in this connection stated that it had not been an unqualified success. While taking note of his concern for bringing about performance improvement in the PSEs, we do not concur with his view that the MOU system has not proved its utility.

While agreeing with Ghosh that there is need to distance public enterprises from the government and that there is also need for both greater freedom of management of public enterprises and greater accountability for performance, it must be stated that the MOU system addresses itself to these very issues in their entirety. A Memorandum of Understanding is an annual performance evaluation document generally based on a long-term corporate plan in which the government (represented by the administrative ministry) and the public enterprise lay down their respective obligations and responsibilities for achieving mutually agreed upon targets. In doing so care is exercised in selecting appropriate criteria, assigning priorities to them and deciding on achievement of specific targets. Once these are determined the enterprise is required to be given operational freedom in order to achieve these targets. At the end of the year the enterprise is judged on the basis of the level of individual target achievement which can be interpreted in terms of an individual target score. These individual target scores in conjunction with weights attached to them lead to a composite score for the enterprise as a whole. The MOU system thus attempts to bring about a balance between accountability and autonomy and through that route aims at improved performance which is objectively evaluated at the end of the year.

It needs to be pointed out that one of the most important features of the MOU system is that it enables the government to compare performance of essentially dissimilar enterprises. While the list of commitments for each enterprise is different and in some cases may not lend itself to easy comparison, the ability of an enterprise to meet its commitment is comparable. Simulating a competitive environment is, thus, one of the important possibilities inherent in the MOU system and this aspect gives it tremendous

strength. It is our view that such a mechanism is ideal for developing countries for improving public sector performance.

It would be neither proper nor fair to pass any value judgment on the MOU policy because up to now it has been going through the trial-run stage. Only during the current financial year (1991-92) we hope to make a major dent into the process by attempting to achieve around 5 per cent cost reduction in some major PSUs. Since the whole MOU exercise is totally open and the details of the MOUs signed and the manner in which they are evaluated are available, the quality of debate on the MOUs would have been better served if there was greater specificity in the criticism.

Department of Public Enterprises,
New Delhi.

Peaceful Demonstrators Arrested

WE strongly condemn the arrest of social activist Kumar Chandra Mardi and 20 tribals when they were protesting against the construction of Icha dam, a part of Subarnarekha Multipurpose Project, at Icha near Chaibasa, Singhbhum district of Bihar. The project, financed by the World Bank, is a joint venture of the States of Bihar, Orissa and West Bengal. On April 5, 1991, the local people, mostly tribals, sat on indefinite 'dharna' at the dam-site to stop the construction of Icha dam. The 200-strong non-violent protest was organised by local organisations to

stop the ongoing construction of the dam because this dam will displace nearly 30,000 people—majority of whom belong to Ho tribe—from over 61 villages whose survival and livelihood are at stake. They are up against the project as it violates international laws which say that no tribe can be displaced without proper rehabilitation and resettlement. So far, project authorities have not come up with any rehabilitation plans to resettle the displaced people. But the lands of the would-be displaced people are being notified for acquisition and only cash compensation is being offered as rehabilitation.

On April 8, the deputy commissioner came with a large police force to evict the protesters. The protesters refused to stop the 'dharna' unless their demands were accepted by the project authorities. Without giving any notice, the police started dragging people including women and children to the police bus which took them to Saraikala police station. Kumar Mardi and 20 tribal women were taken into custody. They have not been released so far.

We demand the immediate release of activists and protesters and join the protesters demanding that the State government and project authorities halt the construction of dam until a proper rehabilitation plan for the displaced population is formulated and implemented; a complete review of the project from the social, economic and environmental angles is carried out; and the displaced people are given access to information about the dam, displacement and rehabilitation.

Changed Priority?

WITH the ever present danger of being forced to renege on our debt servicing liabilities, the prospect of further, and very much larger, resort to the IMF is coming closer by the day. The groundwork is being done already. The new government's first task will perhaps be to formally put its stamp of approval on the memorandum of understanding which is right now being worked out by our bureaucrats with their counterparts in the Fund. On one issue the present caretaker government seems to have made a firm commitment already which is that the fiscal deficit of the Centre for 1991-92 will be brought down to 6.5 per cent of GDP from the level of 8.5 per cent in 1990-91. The commitment does not stop there. The fiscal deficit is to be reduced further in the coming three years to 3.4 per cent.

Surprisingly while some arithmetic calculations have been put out of what these commitments could entail in terms of the size of the fiscal deficit, there has been little discussion of what their implications for economic policy are likely to be. After all, for the last more than 40 years, through the periods of the successive five year plans, the yardstick by which the government's fiscal operations, including those through the budget, have been appraised has been deficit financing, defined as net credit extended to the government by the Reserve Bank of India. There have been differences between the Central finance ministry and the Reserve Bank over the calculation of these figures, but these have been eventually sorted out. The high powered Sukhamoy Chakravarty committee too endorsed the practice as one operationally as well as conceptually useful in assessing the inflationary impact of the government's financial operations.

That the fiscal deficit is very different from deficit financing should be obvious. For 1990-91, while the fiscal deficit is estimated at 8.5 per cent of GDP, deficit financing is no higher than 3.5 per cent. The difference is represented by the government's borrowing other than that from the RBI. Only a small part of this borrowing was from external sources, most of it was internal. The shift of focus from deficit financing to the fiscal deficit is evidently meant to reduce the government's resort to borrowing other than that from the RBI. Borrowing for financing government expenditure, so long as it is not inflationary, is only in the nature of a draft on savings in the other sectors of the economy. In our case, the one sector of the economy which is relied upon for these savings is the household sector, for, unlike in most of the advanced economies, the corporate sector hardly generates much saving of its own and, therefore, relies substantially on the household sector for financing its outlays. In the cir-

cumstances, it is evident that the whole purpose of the Fund requirement to scale down drastically the fiscal deficit is to curtail the government's access to non-inflationary sources of funds. The objective, obviously, is to reduce the government's role in investment in the economy.

The implications of the commitment we are about to enter into (or has the commitment been made already?) with regard to reducing the fiscal deficit have to be clearly understood. First and foremost, the shift in emphasis from containing deficit financing to reducing the fiscal deficit entails the danger that the accent will hereafter be less on controlling inflation and more on containing the government's operations and role and that could have serious repercussions. To take an extreme illustration, a reduction of the fiscal deficit to 4.5 per cent of GDP could be achieved while at the same time deficit financing actually mounts from 3.5 per cent to 4.5 per cent of GDP. Whatever may be the Fund's priorities in the design of its structural adjustment programmes for various countries, are we sure that it is our priority also to contain the government's scale of operations rather than inflation?

At the same time, the fact has to be faced that domestic borrowing by government has bloated so enormously that interest liabilities alone now account for almost a third of the government's expenditure on revenue account. The result naturally is that to meet the other expenditure commitments of the government even on the revenue account borrowing has to be resorted to. The question of the government contributing to domestic savings therefore no longer arises. Now, conventional economic wisdom tells us that even when the overall rate of investment in an economy is fairly stable there can be ups and downs in sectoral rates of investment. It is also widely accepted that in the early phases of development the government sector's investment can be, in fact needs to be, relatively high. But then the more a government finances its investment through borrowings (that is, the more it relies on savings generated in other sectors of the economy) the more constrained it will be in the future in financing its expenditures. In other words, government borrowing today imposes a constraint of its own on the scale of the government's operations tomorrow. All the same, let us not forget that interest payments by government are mere transfer payments and should not be included when appraising the scale of government operations. The major point to bear in mind is that the borrowing argument itself is being grossly overstated to build up an illegitimate case in support of the stance being forced upon our policy-makers in the matter of the government's budgetary operations.

ELECTIONS Self-Images

A RECENT pre election survey came up with the unremarkable finding that most people do not even look at the election manifestos of parties and that this attitude broadly cuts across caste, sex and economic groups. It is nevertheless interesting to look closely at party manifestos to get a glimpse of the self-images they project and about their perceptions of issues. This is most revealing on issues which the parties themselves do not regard as 'major' or contentious matters, such as health, environment, status of women, population and science and technology. Because many of these have become the focus of mobilisation of people across class and caste lines in recent years, no party can afford to be uninterested in these issues. And yet the fact that these concerns continue to be dealt with in a piecemeal fashion in all the manifestos without being integrated within an overall development perspective shows that the impact of the mobilisation on these issues is yet to be felt as something calling for anything more than a token response.

The Congress(I) has perhaps the most elaborate statements on these issues. Not surprisingly, since it has been in office the longest and these are issues which become manifest only at the stage of implementation. The party manifesto states, for instance, that current laws on environment are in fact the doing of Congress(I) governments. It calls for an integrated National Land Policy. While the manifesto mentions pollution control, and penalties and liabilities for compensation for pollution, etc., it is at pains to distance the environment issue from the policy of industrialisation or development planning.

This is, of course, the general trend—the Bharatiya Janata Party (BJP) views the earth as 'divine mother' and hopes to formulate a national resource management policy, but even though it talks of environment issues influencing import of technology, etc., environment as a matter of policy does not colour its view of industrialisation, irrigation, power or even science and technology. All manifestos mention the need to develop 'appropriate' technology and encourage indigenous efforts but none of course defines what is 'appropriate'. That no party should even mention the need for developing environment friendly processes or products even while making a big issue of 'indigenisation' is indeed revealing. It is only the

National Front manifesto which acknowledges the need to subject all projects (including defence projects) to environmental review and clearance. Significantly, none of the parties mentions the Bhopal disaster in any of their future programmes.

Both the BJP and the National Front have consciously separated health and population whereas the Congress(I) continues to club the two under 'health and family welfare'. But again, it is this party which appears to have a more coherent policy. It is also the only party which talks of special programmes for children which includes components of health care, such as nutrition (ICDS) and universal immunisation etc. Apart from the usual concern for primary health care, the party appears to have a new interest—the working conditions of doctors and health workers. Not only are their service conditions to be improved but their work environments are to be 'modernised'.

The BJP, on the other hand, is the only one of the three which promises a new drug policy (although not in so many words) where the "60,000 brand name drugs" are to be replaced by "250 generic formulations". It is also the only one which categorically promises a "ban on amniocentesis—sex determination tests—often leading to female foeticide". That an issue which has seen large scale mobilisation should have been mentioned specifically by the party is an indication of the party's awareness of the political importance of the sections which have taken up such issues.

On women, while all the three manifestos make the usual magnanimous promises, there is hardly any indication that their basic perspectives are any different. And interestingly, it is only the Congress(I) which promises that the ban on "the practice, propagation, celebration and glorification of sati will be fully and strictly enforced". It also promises a ban on the indecent representation of women on posters, advertisements, hoardings, etc.

On the whole, it would seem that the National Front manifesto reflects neither the political acumen of those of the other two parties nor the sort of awareness which the Congress(I) manifesto displays, coming from the party's years in office when these issues had necessarily to be tackled, however superficially.

THIRD WORLD DEBT Need for Joint Action

APART from the issue of diplomatic propriety of making disparaging remarks

about the government of West Bengal while he was its guest in Calcutta, the Hungarian president, Arpad Goncz's statement that "I have seen the poverty and crowds [of Calcutta] and can feel that the communists are here" raises a rather simple question—what have the crowds got to do with communists? Aren't Tokyo, New York and London crowded too, without any noticeable presence of the communists in any of these megalopolises?

A much more pertinent question will, however, be what about the poverty in Hungary now that the communists have been thrown out? Is it on its way out too? Has the new regime headed by Goncz been able to initiate a process of liquidating it? Unfortunately, not. Some time ago, Goncz himself had told the Hungarian parliament that "the threat of unemployment is hanging over us like a black cloud". More, the socio-economic programmes launched by the post-communist government is slated to intensify the popular misery, as the president himself says "one part of the society will become disproportionately rich and another part will be disproportionately poor". In a year's time, "there will be one million unemployed in a country of 10.5 million", says the scientific director of a Hungarian research institute, adding further that "50 per cent of them will never be employed again".

Blissfully ignorant of the real state of Goncz's own house, some people here with certain antipathies have lapped up his digs at the West Bengal communists. Some have gone even further. Holding up the fact that Hungary was able to secure foreign investments of \$ 500 million last year, it has been suggested that India take a leaf of Hungary's book and cultivate the Atlantic Bloc by getting rid of 'Third World neuroses'. But the fact is that at \$ 1,840 Hungary has the highest per capita debt in the world and no amount of foreign investment is likely to help it get free from this burden. The remedy lies in the unity of the world debtors for getting the debt burden reasonably scaled down, that is, closer Third World solidarity.

KASHMIR

More Repression

A Correspondent writes:

THERE is not a single sentence one can write about state violence and repression which has not already been written. Yet how does one not write about the sordid

goings on in Kashmir where every grisly incident brings promise of worse to come? Those who know will not speak and the vast majority are kept ignorant about the crimes being committed in the name of Indian nationhood and the interests of the Indian people.

On January 30, there was a major clash between the security forces and militants at Dayalgam in which eight soldiers died. As a retaliatory measure, the security forces dragged out three youth—Abdul Ghani Shaikh Master, Bashir Ahmed Majre and Abdul Rahim Naffar, if it means anything to mention their names—and beheaded them, leaving their headless bodies by the roadside.

On the night of February 23-24, a large contingent of the security forces numbering 800 entered the village of Kunan Poshpura, segregated the men-folk and then gang-raped the women left behind. The district magistrate of Kupwara, in his communication to the divisional commissioner, Srinagar, dated March 7, says 23 women were raped, but according to justice Mufti Bahauddin Farouqui, 53 women affirmed before him that they had been sexually assaulted. The government, showing exemplary alacrity, claimed that the allegations were "baseless and planted". This had allegedly been established by an inquiry, undertaken by none other than an army brigadier! However, a one-day inquiry conducted by the divisional commissioner strongly urged an investigation into the allegations. The veracity of the government's claim has been called into question also by the FIR filed on March 8 by the officer in charge of the Trehgam police station.

On April 20 during a raid by the security forces a suspected area commander of a militant outfit, Al Barq, was arrested and shot point-blank. Later the same evening seven male members of a Gujar family—once again, if the names mean anything: Abdul Rashid, Mohammed Ayub, Gulab Khan, Ismail Khan, Sadarudin, Khan Wali and Babu Khan—who were accused of providing shelter to the suspected militants were dragged out and shot dead.

Reports by journalists and inquiries by democratic rights organisations confirm that there appears to be a deliberate attempt by the security forces to make women the primary targets of attack and from incident after incident there emerges a pattern designed to break the morale of the people. The supposed crack-down on

the militants has turned into a policy of suppression of the entire Kashmiri people. It is contended that it is the inadequacies of the administration which make it possible for the militants to gain the upper hand and, therefore, that it is only through administrative measures, a euphemism for actions such as those described above, that the state must restore its authority. This by and large is the common understanding shared among the state functionaries, the parliamentary political parties of the right and left and the government.

When recently the JKLF and its supporters came out on the streets of towns in Kashmir to oppose the Hizbul Mujahideen and shouted slogans against it and against Pakistan and demanded 'Azadi', this was taken as a mark of the success of the policy followed by the present State governor and by implication as justification for the kind of repression referred to above. What such wishful thinking ignores is that notwithstanding the conflicts among the militant groups, popular aspirations continue to express themselves in favour of 'Azadi'. Even the Kashmiri Pandits, whose alleged plight moves the heart of every national jingoist, came out in Udhampur on April 19 shouting anti-Indian and pro-Pakistani slogans. The administration had to arrest five of them for 'anti-national activities'.

POI TICS

BJP's Appeal

THE success of the West Bengal BJP in roping in for its electoral campaign important personalities from different walks of life, such as a top ranking film star, retired top administrators belonging to the IAS and IPS cadres, well known singers, physical culturists, lawyers and so on, is something which deserves serious notice. Despite the fact that the late Shyama-prasad Mukherji, the founder-president of the old Jana Sangh, is held in high esteem by the Bengali Hindu middle class, an explicit communalist approach to politics has not impressed this class in the past. The BJP's elements of success so far this time do not perhaps indicate a complete reversal of this tradition. Though 'Ram shila' and 'rathayatra' did undoubtedly draw in segments of the sons of the soil in some mofussil areas and large chunks of the Hindustani population in the Greater Calcutta region, the recent assembly of individuals from the sophisticated urban Bengali elite cannot be linked to those crude gimmicks.

The most important factor behind the reinforced appeal of the BJP today is the widespread perception that it is the only political force with some ideological commitment—an honour so far exclusively reserved for the Left. These days the communists and their allies are seen—rightly or wrongly—as power-seekers (and power-brokers) of the garden variety. More serious perhaps is the fact that some of the BJP's subtle talking points are beginning to appeal to the Hindu middle class psyche. For instance, the so-called appeasement of the Muslim minority—the Shah Bano case is referred to in this connection—the special Constitutional provisions for the State of Jammu and Kashmir, which are supposed to have stimulated and legitimised the separatist tendencies of the Kashmiri Muslims, and so on. The BJP's cry 'say with pride I am a Hindu' also is striking a responsive chord in many minds.

As against all this, the Left Front campaign does not generally go beyond the BJP's culpability in the communal carnages in different regions. This may succeed in partially dampening the explicit enthusiasm of BJP supporters but fails to counteract the communal venom injected in their mind.

The BJP may not after all make much electoral impact this time, but its image as a principled (ideological) force and its message as a champion of consistent democracy and age-old Indian culture will remain a force to contend with, unless the true character of the party is effectively exposed.

SOVIET UNION

Political Use of Miners' Strike

THE strike by Soviet coal miners, which commenced in early March, comes at a time when the Soviet government is pre-occupied with political problems. The perennially recalcitrant Boris Yeltsin, manoeuvring within the Russian parliament, has obtained extraordinary powers of the kind that Gorbachev has been able to extract from the Soviet parliament, giving rise to the possibility of an intractable war of decrees. Meanwhile, the republics have become increasingly restive for independence and the result of the recent referendum has done little to dispel the threat. In addition, hardliners in the party have stepped up their efforts to seek not Gorbachev's ouster but his conti-

nance in office under their control. The government's attitude to the strike has, naturally enough, varied according to its own situation.

Strike action was initiated in early March in the main government-owned coal basins of Donbas in the Ukraine and Kuzbas in western Siberia. Co-ordinated by the 80,000-member Independent Miners Union representing more than 200 mines, the strike spread to Vorkuta and Inta in the Arctic Circle and Karaganda in Kazakhstan. Towards the end of March it was being claimed by the National Strike Co-ordinating Committee that 3,00,000 miners from 165 pits were involved in the strike with five of 10 mines in the Chelyabinsk region in the Urals also having joined in. In Kuzbas 51 mines and in Donbas 58 of 122 mines were participants. The government, however, claimed a far smaller figure.

In the initial days of the strike the miners' economic demands were confined to a 100 to 150 per cent increases in wages and pension after 25 years of work underground, while their main political demand was the resignation of Gorbachev. By the end of March the strike co-ordination committee had laid down four basic demands—resignation of Gorbachev, dissolution of the congress of peoples' deputies, resignation of the Soviet government and transfer of supreme power to a federation council of republican presidents and conclusion of a new wage agreement for miners and all other industries where workers so demanded.

This sudden enlargement of the scope of the miners' demands is not difficult to fathom. Firstly, miners receive at least 100 roubles more in monthly wages than the average worker in the Soviet Union. Further, there was the government's insistence that agricultural production was being affected because of disturbances in coal supply. A demand for only a wage increase, in the circumstances, may have evoked little sympathy from the working class in general. This also explains the committee's demand for wage settlements with all workers.

While the economic ploy did meet with some success with expressions of solidarity coming from steel, rail and aviation workers, the attempt to gain political support would appear to have failed. While Yeltsin was prompt in responding to the situation and projected himself as the spearhead of democratic groups, republican nationalists and the striking

miners, the government's initial indifference gave way to a shrill hardline. Prime minister Valentin Pavlov dismissed the strikers' demands as unjustified in the light of current mining productivity and the overall economic situation, claiming a 5 per cent drop in productivity throughout the economy and a decline of 75 million tonnes in production in the past three years. Deputy prime minister Lev Ryabev asserted that the government was bound by new labour legislation not to negotiate with striking workers in the energy sector, while labour minister Vladimir Scherbakov argued that the miners' demands could not be met since, if they were, oil and metallurgical workers would make similar demands next.

However, as the effects of the strike began to tell, the government softened its stand. Three weeks into the strike, daily coal supply was down to 2,20,000 tonnes against the required 3,40,000 tonnes, leading to fears of widespread industrial closures. Following talks between the government and miners' representatives, an agreement was reached hiking wages by 25 per cent every three months for a year from this April in return for an increase in production from the current 703 million tonnes a year to 711 million tonnes over 12 months. Strike committees in Kuzbas, Donbas and Vorkuta, however, rejected the settlement and reiterated the political demands and this is where they appear to have failed. The government in response spoke of a moratorium on strikes till the end of the year and of the need for a nation-wide emergency to deal with the strike since it would lead to the breakdown of the entire metallurgical industry. Pavlov, presenting an anti-crisis programme to parliament, sought sanction for use of state coercion to break strikes.

Its adverse economic consequences notwithstanding, those contending for power seem to have put the strike to good political use. If ceaseless talk of crisis, particularly one initiated by the working class, was used by the Centre to get rivals for power to compromise, for Yeltsin championing the miners' cause was equally an attempt to get the Centre to negotiate with him. Gorbachev managed to beat back hardline opposition in the party and worked out an agreement with Yeltsin and eight other republics' leaders offering to review the steep hike in prices of food and consumer goods. They in turn appealed to the miners to resume production and make up losses.

TWENTY YEARS AGO

EPW, May 1, 1971

The long expected demarche in Sino-American relations has taken place in the theatrical guise of a warm official welcome to US table tennis players in Peking. There might be many strands in Peking's reasoning leading up to the particular timing of this dramatic gesture of bonhomie. Among these strands, the thought of helping the growth of the anti-war movement in the United States, and possibly making some impact on the presidential election in 1972, by lessening Sino-American tensions and allaying the usual US fears of Chinese expansionism, could not have been missed in Peking. This gesture might also have been accelerated by the ignominious defeat of the US-inspired South Vietnamese invasion of Laos. Coming so soon after the North Vietnamese victory in Laos, the Chinese overture could not have been misconstrued by Hanoi as a sign of Peking edging out of a difficult situation in South-East Asia. Additionally, American war weariness could be accentuated by coupling the well-publicised rout in Laos with a show of sweet reasonableness by China.

★ ★ ★

Some State governments are always quicker than others at identifying their travails and playing them up appropriately. Prominent in this category is the government of Tamil Nadu. Their latest (publicised) difficulty lies in the 'green revolution' area. According to a Press report, the agricultural plan of the State for the current year is in danger of failure. The reason is familiar—a shortage of funds. Ever since the Gadgil Report sanctified it with undue emphasis, the concept of the 'credit gap' has been much bandied about. What is frequently forgotten is that there hardly exists an area in a scarcity economy such as ours where a 'credit gap' does not exist or cannot be identified or even roughly quantified. In launching on specific programmes, it is surely more important to consider what is feasible, rather than base action on near-miraculous fulfilment of extravagant expectations.

Since the nationalisation of the major commercial banks, banks have come to be viewed as a limitless source of funds for all 'productive' ends. In actuality, bank credit is a scarce resource; and while its present distribution does not perhaps follow any principle of optimisation of economic or social benefit, further distortion of the pattern of regional distribution of credit in favour of the more affluent States will have adverse political overtones.

Improved Profitability

Kumaran Pola

HYDERABAD INDUSTRIES' sales showed a 16 per cent increase on annualised basis during the year ended March 31, 1990 to Rs 107.54 crore. Through tight control on costs, the company managed to bring down the expenses to sales ratio from 1.094 in 1988-89 to 0.911 in 1989-90. Raw materials cost showed a 20 per cent rise whereas the spurt in employees cost was lower at 9 per cent, both on annualised basis. Other expenses showed a nominal decline by 1 per cent. All these helped in increasing operating profits by 41 per cent of Rs 13.88 crore and net profits by 48 per cent to Rs 7.37 crore.

During the year under review, production of asbestos cement products was 2.80 lakh tonnes as against 2.74 lakh tonnes on an annualised basis during the preceding period. The production of mill board, moulded thermal insulation articles, jointings and thermal insulation products (refractories) was satisfactory.

The company achieved a handsome improvement in the profitability ratios during the year. The overall return on investment moved up from 5.15 per cent on annualised basis in 1988-89 to 7.63 per cent in the latest year. An improvement in the assets utilisation ratio from 0.96 in 1988-89 to 1.11 in the latest year along with a spurt in the net profit margin on sales from 5.35 per cent to 6.85 per cent jointly brought about the above result. At the same time, the company achieved for the shareholders a higher return on owners' equity at 13.30 during the year compared to 9.99 per cent on annualised basis during the preceding period.

The capital structure got further tilted towards equity during the year as reflected in the debt/equity ratio of 0.141 in 1989-90 as against 0.261 in the preceding year. A corollary to this was the spurt in the interest coverage ratio from 4.31 to 7.67. The change in the capital structure

was brought about by sumptuous plough back of profits to reserves and surpluses component of owners' equity compared to a subdued borrowing programme during the year. The company experienced some pressure on the working capital position. There was some accumulation of inventories which was more than offset by the decreases in receivables and cash and bank balances. Therefore, despite a fall, though nominal, by Rs 0.15 crore in current liabilities and provisions, the current ratio declined from 1.78 in 1988-89 to 1.67 in the preceding year.

An amount of Rs 16.70 crore was raised and used during the year as evident in the balance sheet changes. The following were the sources of funds during the year: increases in share capital Rs 0.13 crore on account of the capitalisation of reserves for the issue of bonus shares, in reserves and surpluses Rs 5.38 crore on account of the transfer of profits to reserves and in short term borrowings Rs 1.54 crore in view of the non convertible debentures maturing in 1990. Decreases to the tune of Rs 5.23 crore in receivables and Rs 4.42 crore in cash and bank balances were the remaining sources of funds during the year. The company used the funds to decrease the current liabilities and provisions by Rs 0.15 crore and to reduce long-term borrowings by Rs 7.05 crore. The balance funds were used for investment in various assets. The net fixed assets of the company increased by Rs 2.34 crore on account of the additions to plant and machinery and buildings. Similarly, there was an increase in inventories of stores and spares, raw materials and components and materials purchased for sale by Rs 4.98 crore during the year. The remaining uses of funds consisted of the increases in miscellaneous current assets Rs 0.55 crore, in investments on account of purchase of shares of India Gypsum Rs 1.45 crore and in intangible assets representing technical know-how expenses Rs 0.20 crore.

The company signed a memorandum of understanding for Soviet technical know-how and assistance for the manufacture of extraction, handling and sampling equipment and systems for ore and minerals including coal.

NIZAM SUGAR FACTORY Cane Shortage Eases

NIZAM SUGAR FACTORY achieved a 38 per cent growth in sales on annualised basis to Rs 76.64 crore during the year ended March 31, 1990. In view of the

Balance Sheet Analysis by Manisha G. Mehra

expenses to sales ratio coming down drastically from 1:1 in 1988-89 to 0.93:1 in 1989-90, the company could make a turnaround in profits. The directors were happy to record that for the first time in about 10 years the company had made profits. The high-water mark of the company's performance in the last three years was the improvement in capacity utilisation from about 60 per cent to around 90 per cent in the sugar units. A well designed incentive programme for sugarcane cultivation and supply and for the propagation of high sucrose varieties has secured good results.

Cane shortage which had bedevilled the company for years disappeared and the quantity of sugarcane crushed increased by two lakh tonnes or more in each of the last three years. The distilleries performed well and earned profits. Apart from extending incentives on its own, the company provided loans to the farmers under the Sugar Development Fund of the government of India. The company crushed 13.74 lakh tonnes of sugarcane during the year as against 11.50 lakh tonnes in the preceding year. The production of sugar reached 13.49 lakh quintals during the year, up from 11.28 lakh quintals during the preceding year. The company achieved a sugar recovery of 9.79 per cent in 1989-90 compared to 9.81 per cent in the preceding year.

During 1989-90, the operating profits of the company quadrupled to Rs 7.18 crore from Rs 1.86 crore and the net loss of Rs 1.79 crore was converted into a net profit of Rs 3.93 crore. The overall return on investment improved to a positive 4.46 per cent from a negative 1.74 per cent in the preceding year. The factors which led to this improvement are a higher assets utilisation ratio of 0.87:1 in 1989-90 as compared to 0.81:1 in the preceding year and a positive net profit margin of 5.13 per cent as against a negative 2.16 per cent in the preceding year. The return on owners' equity improved to 23.45 per cent during 1989-90 from a negative 9.82 per cent in the preceding year.

With the retained earnings strengthening the equity base, the company's capital structure reflected a lower debt/equity ratio of 2.51:1 compared to 2.65:1 in the preceding year. This partly explained the spurt in the interest coverage ratio from 0.51 times in 1988-89 to 2.39 times. Along with a balanced capital structure, the company experienced a better working capital position too. The current ratio improved from 2.17 in 1988-89 to 2.39 in the latest year. However, on closer analysis one could see that this was on account of huge build-up of finished goods inventories.

The balance-sheet changes showed a funds-flow of Rs 19.42 crore. The sources

of funds consisted of increases in various items on the liabilities side of the balance-sheet: increase in share capital Rs 1.00 crore which represented the amount drawn by the company on capital account as equity from the government of Andhra Pradesh for the establishment of a distillery unit at Medak, in reserves and surpluses Rs 3.61 crore on account of the ploughback of profits of 1989-90, in current liabilities and provisions Rs 5.00 crore on account of the accumulation of sundry creditors, in short-term borrowings Rs 8.02 crore by way of additional bank overdrafts, etc, and in long-term borrowings Rs 1.79 crore by way of term loans from institutions and banks. The largest share of over 66 per cent of the funds raised during the year was absorbed by rise in inventory, Rs 12.92 crore. The balance funds were used to increase net fixed assets by Rs 2.06 crore for additions to land, buildings and plant and machinery, receivables by Rs 0.98 crore, cash and bank balances by Rs 0.64 crore, miscellaneous current assets by Rs 2.63 crore representing loans and incentives to sugarcane growers and finally investments in company shares Rs 0.21 crore.

DALMIA CEMENT (BHARAT)

Focus on Energy Conservation

DALMIA CEMENT (BHARAT) recorded a moderate increase of 9 per cent in sales during the year ended March 31, 1991. As there was no major increase in costs, except employees cost which spurted by a substantial 46 per cent, the operating profits were up by 5 per cent and net pro-

fits by 17 per cent during the year. The expenses to sales ratio remained steady at 0.91:1 in both the years. As a measure of cost reduction and conservation of energy, the company commissioned the slip power recovery system. The 'O' Sepa High Efficiency Separator for cement mills was installed and an order was placed for kiln supervisory control system for commissioning in 1990-91.

Clinker production was lower at 6.01 lakh tonnes during 1989-90 compared to 6.65 lakh tonnes in the preceding year and cement production was 6.63 lakh tonnes against 6.76 lakh tonnes. The production of dead burnt magnesite increased to 41,000 tonnes from 39,000 tonnes in the preceding year and that of iron ore to 141,000 from 132,000 tonnes.

The company achieved an improvement in the overall return on investment from 2.03 per cent in 1988-89 to 2.32 per cent in 1989-90. It improved its assets utilisation ratio from 0.54:1 to 0.58:1 and the net profit margin from 3.74 per cent to 4.02 per cent which jointly pushed up the overall return on investment. There was a nominal rise in the return on owners' equity from 4.76 per cent to 4.93 per cent. The debt/equity ratio declined from 0.99:1 in 1988-89 to 0.84:1 in the latest year. This change in the capital structure of the company resulted from additions to reserves and surpluses during the year when there was a net reduction in borrowed capital. This got reflected in a higher interest coverage ratio of 1.65 times in 1989-90 compared to 1.49 times in the preceding year. The higher current ratio of 2.44 in 1989-90 compared to 2.09 in the preceding year was reflective of an improved work-

ing capital position. This was accounted for by a low growth in accounts payables accompanied by a high accumulation of accounts receivables waiting for collection.

The funds-flow during the year amounted to Rs 13.58 crore. The sources were increases in reserves and surpluses Rs 7.47 crore and in long-term borrowings Rs 2.13 crore and decreases in inventories Rs 1.40 crore and in investments Rs 2.58 crore.

The company took rupee term loans from the financial institutions. The reduction in investments was due to the sale of UTI units. The funds were utilised during the year to decrease current liabilities and provisions by Rs 1.67 crore and short-term borrowings by Rs 4.71 crore and to increase net fixed assets by Rs 2.64 crore, receivables by Rs 3.38 crore, miscellaneous current assets by Rs 1.17 crore and cash and bank balances by a nominal Rs 0.01

crore. The company repaid part of the cash credit from banks. The additions in fixed assets were mainly in the form of machinery and electrical installations.

The company has on hand a joint venture project with the Industrial Promotion and Investment Corporation of Orissa for the manufacture of one lakh tonnes of pig iron per annum. The techno-economic feasibility report is under preparation.

IN THE CAPITAL MARKET

Krone Communications

ARONL COMMUNICATIONS promoted by Krone AG of West Germany and Karnataka State Electronics Corporation and M. I. Thukral and Associates, will enter the capital market on May 9 with a public issue of 13.20 lakh equity shares of Rs 10 each at par. The issue is being made to part finance the company's Rs 11 crore project for the manufacture of telephone connectors including back panel connector and related products for use in telecommunication network and commercial and industrial systems. Krone Communications went into production in October 1989. It manufactures Krone ISATEL cable connection systems, a quick, reliable and compact method of terminating telephone cables in the telecommunication cable network. The project has been set up in technical and financial collaboration with a 49 per cent equity participation by Krone AG, West Germany. It involves the use of imported plant and machinery such as CNC moulding machine, injection moulding tools, specialised press tool and assembly jig for the manufacture of the cable connection systems. Krone Communications will use poly-based plastics like ABS, polybutyl terephthalate, unsaturated polyester, propylene and polypropylene. Krone AG is engaged in the manufacture of a wide range of telecommunication products like copper and fibre optic transmission systems. The co-promoter, Karnataka State Electronics Development Corporation, was set up to promote the electronics industry in Karnataka. Krone Communications has projected a good market for its products in view of the plans of the department of telecommunications to install five million additional telephone lines by 1995 and 20 million by the year 2000.

Tamilnadu Telecom

TAMILNADU TELECOMMUNICATIONS, promoted by Tamilnadu Industrial Development Corporation (TIDCO) and Telecommunications Consultants India (TCI), one a State and the other

a Central government undertaking, will enter the capital market on May 9 with a public issue of 44,63,500 equity shares of Rs 10 each at par. The issue is being made to part finance the setting up of a Rs 28.7 crore project for the manufacture of polyethylene insulated jelly filled telecommunication cables. The plant, to be located at Arkonam in Tamil Nadu, will have a capacity to manufacture 6.25 lakh core km per annum. The project is being set up in collaboration with the Essex Group, USA. The promoters expect to commence commercial production by the third quarter of 1991. They have given an assurance of exporting cables worth Rs 22.8 crore during a three year period. The prospects for jelly filled telephonic cables (JFIC) are good in view of the decision of the department of telecommunications (DoT) to convert all the existing telephone lines gradually to JFIC. According to the perspective plan of DoT during 1990-95 more than five million additional telephone lines will be installed which will require 700 lakh core km of JFIC. TIDCO, the co-promoter, has been in operation since 1965 and has promoted various industries in Tamil Nadu. It assisted 56 projects with a total outlay of Rs 1,200 crore. TCI set up in 1978 under the department of communications provides consultancy and related services in the field of telecommunications both in India and abroad. It executes turnkey projects abroad and also exports telecommunication equipment.

Polymechplast Machines

POLYMICHELPLAST MACHINES (PML), an existing profit making, Baroda based company, is planning to enter the capital market to part finance its expansion project to manufacture high capacity injection moulding machines for export and the local market. The project will be put up at Savli, near Baroda, at a total capital cost of Rs 9.50 crore in the first phase. PML is a member of the 13 year old reputed Plastico group of industries and is presently manufacturing

injection moulding and blow moulding machines under the brand name of 'Goldcoin'. PML has the distinction of being the only successful manufacturer of double colour, marble effect, injection moulding machines in India—till date. It has earned a distinct reputation as a leading service-oriented manufacturer of economical, high speed, energy-efficient, computer controlled machines. At present PML is exporting to USSR, Africa, Bangladesh, etc. Export enquiries worth Rs 36 crore for deliveries up to 1993 are in hand and are in an advanced stage of negotiation. PML is planning to expand its product range and include injection blow moulding machines, reaction injection moulding machines, stretch blow moulding machines, etc., for both import substitutions as well as export. According to K. R. Bhuva, the managing director, this will be the first of the group's three prestigious projects to enter the capital market. Project management and merchant banking consultancy is being provided by VMC Project Technologies, Baroda.

Do-Max Steel

DO-MAX STEEL is setting up a modern 30,000 tpa capacity steel plant near Baroda in the backward notified area of GIDC at Waghodia. According to the managing director, H. P. Rath, this project will use the latest US induction steel melting technology, using energy efficient, cost effective production methods supplemented by latest quality control equipment and material handling systems. The company will manufacture import substitute alloy steel for special application in core sectors. The total capital outlay on the project is Rs 5.95 crore which will be part financed by equity capital issue for which the company will be entering capital market very shortly. The lead managers to the issue will be the Merchant Banking Division of VMC Project Technologies, Baroda. The project is in an advanced stage of implementation and the group has ambitious plans of both forward and backward integration.

Calcutta Diary

A M

By all means let us look forward to the prospect of a hung parliament and that of, once more, a severely weak regime in New Delhi. What is rack and ruin for the bandmasters in New Delhi need not be rack and ruin for the vast majority constituting the nation's poor and middle classes.

It is an altogether new development, mobilising international loan-giving agencies for electoral campaign within the country. Reports, carefully slanted, are carefully planted in the newspapers. The sources are supposed to be highly placed government officials 'interacting' with these external institutions. It is of course quite conceivable that there is in fact no such 'interaction' and no civil servants briefing the press. Some straightforward fiction is being attempted. One or two individual members, who have their connections with the media and who cannot wait to see the politicians of their choice return to the seat of power, are practising a piece of blackmail on the electorate: unless you vote right, unless you vote for a stable single-party regime—you know which one—credit-giving institutions such as the International Monetary Fund and the World Bank would stay away and offer no loans to bail us out. Our credit rating in the international money market too, the voters are being warned, depends upon how voters exercise their suffrage. The Cabots have spoken to the Lodges, and the Lodges have duly communicated the confidential information to God. Should there be no stable regime in New Delhi following the elections, busybodies in the international financial institutions have allegedly told our officials, prospects of steering the economy out of the present crisis would, according to their judgment, be bleak. The reasons are not far to seek. Whoever form the government would have to opt for a long-term policy of thoroughgoing structural reforms and initiate a series of stern measures to enable the economy become more competitive; measures of this sort could by implication be taken on hand only by a strong administration. Foreign credit-giving agencies, as per stories as floated in the newspapers, are disgusted by the goings-on in the country since November 1989, two minority governments, precariously perched on outside support, were incapable of taking any major economic decisions. The consequences were, in the view of unnerved spokespersons of the Fund, the Bank and the Asian Development Bank, disastrous. Such are also the views of functionaries of American and Japanese credit-rating agencies, should no stable government emerge after the elections, they have reportedly warned North Block, India's rank in their scales might drop further.

The message intended for the docile voters could not have been more explicitly stated.

vote the way foreigners want you to vote, otherwise you face ruin and perdition. There is as yet no guarantee that the ploy will work. The Indian electorate may yet spring a surprise on the partisan journalists itching to sell the country down the drain, and on faceless civil servants whose minds travel along the same wavelength as that of these presswallas. Consider the ingredients of what is described as ground reality. The majority of the electors, poor and hard-up, beyond measure, are not greatly concerned whether there is or is not enough foreign exchange in the kitty, even assuming there is not, what grave re-ordering in their standard of living would be called for by that supposedly indescribable calamity befalling the nation? Even without foreign exchange, life for the nation's poor would remain about the same, they have been exploited and deprived systematically in the course of the past forty-four years, they would, according to all indications, continue to be so deprived. If anything, in case they make the blunder of giving a clear majority to a political party, an arrangement a group of journalists prefer, a group of officials prefer and so too foreign credit-giving institutions, the government formed by the party is unlikely to allow any growth under its feet and would immediately accept, lock, stock and barrel, the stabilisation programme made ready by these foreign institutions and 'friendly' foreign governments patronised by the latter. Such a programme would drive the nation's poor further against the wall. The details of the stabilisation programme follow certain standard specifications which have been applied in the case of other countries and are therefore well known: they are intensely class biased. It is a dicey situation, the millions of the nation's under-privileged may still not vote according to the wishes of journalists who write to order and committed civil servants who consider it their first duty to advance the cause of foreign credit-disposing agencies. Were the nation's poor even marginally concerned about how to protect their own class interests, their vote would straightaway be cast in favour of a shaky, wobbly, unstable regime. A weak government, the outcome of a hung parliament, would be in no position to initiate 'strong' economic measures, however much civil servants and foreigners cry for such measures to be in Hurrah and hallelujah, with a shaky, ramshackle government *in situ* in New Delhi, the poor and the middle classes would for the present at least be

spared the fate of further immiserisation.

That apart, and the cheek of foreign institutions to try to interfere in our domestic political process apart, what about the underlying economic assumptions on the basis of which these outsiders reach their conclusions? The crisis currently engulfing the Indian economy has absolutely no causal link with the nature of regimes presiding over the government of India during the past eighteen months. The crisis is, on the other hand, the legacy of the party that ruled the roost throughout the 1980s. The government set up by this party was, by all definitions, strong. It was presided over first by the formidable mother and, after her assassination, by the always-unsure-of-himself-and-for-jolly-good-reason son who was wont to accept whatever outside advice was forthcoming from whichever quarter, as long as such advice was coated with the veneer of superficial smartness. Notwithstanding its strength and stability, or precisely because of its strength and stability, with none in a position to challenge it, this government blindly and obediently followed the line laid down by foreign credit-giving institutions. The economy opened up as per instructions received. Unbridled imports took place of capital goods, of a very wide range of inputs and components, and even of luxury consumer goods in both ckd and non-ckd conditions. The foreign credit-giving institutions were never satisfied; they urged even further liberalisation. Those in charge of the government in New Delhi during the most part of the past decade immediately complied. The aid-providing institutions have kept behaving in the manner of Oliver Twists, they have persisted with their demand for more and more concessions for foreign investors and purchasers, they have also persisted with the other demand, namely, the depreciation of the rupee being rendered into a continuous, uninterrupted exercise. The arcadia foreign aid-disbursing institutions promised against such steps did not come about. Exports failed to pick up, at least they failed to scale the heights they were assumed to scale as a matter of course. The flow of foreign private investment did not improve. Remittances by Indians resident overseas tapered off. Nothing else mentioned in the blueprints of the World Bank and the IMF came to life; only imports soared. Strains in the balance of payments got aggravated. Totally undeterred by the development, and advised once more by the same set of foreigners as did service previously, the government went on a binge of borrowing short-term funds at outrageously exorbitant terms and conditions. As if it was all a lark: the process of adding to the country's indebtedness continued, with a frightening mindlessness, for months on. The debt service burden as a result spilled beyond the conventional safe limit defined by the foreign credit-disbursing agencies themselves. These agencies did not bother to warn the stable government that was there in New Delhi to temporise. On the contrary, they urged the government of India to liberalise further, to import even more, to

depreciate the rupee further. Since such tremendous stress is laid these days on the concept and content of accountability, can the foreign aid-disbursing agencies therefore escape the responsibility for the country's present economic mess, are not they co-authors of this mess? The two minority governments, one following the other, in the past year and a half were left to deal with the consequences of this mess. True, the National Front government, which lasted for barely eleven months, did not exactly cover itself with glory while coping with the difficulties encountered. It had conceivably some built-in inhibitions. Its leader and Prime minister was, at least for half the time, finance minister of the previous regime too. He, not unnaturally, was a victim of ambivalence. The finance minister in his government was not much of a help either. He was well meaning in his own manner, but, not having any political base of his own worth the name, could contribute little to clear the fog of indecisiveness which had settled in in the proximity of the prime minister's office. The moment it was installed in office, the National Front government should have stopped listening to the advice of the foreign aid providing institutions and that of officials favoured by the latter. It is a considerable tragedy that it did nothing of the kind. The tragedy has afflicted the nation, not the foreign credit dispensing agencies though. They had no reason to complain: they have succeeded in pushing the country and its government into an impossible corner. Was not that what was intended? As regards the successor regime which currently continues on a caretaker basis, again foreign institutions hold it on the tight leash. It is a fact that this caretaker government was unable to initiate harsher fiscal and monetary measures and failed to present a regular budget which could have spelled out these measures. But that was because the political party presiding over the government throughout the eighties, which lent parliamentary support from outside to this minority government, did not want to see these things on the anvil. The foreigners desperately anxious to take over India should therefore address their grouses toward the direction of this political party.

So the Indian electorate be better not intimidated, it better not be served with grossly tainted economic and political analysis either. In any event, what is rack and ruin for the handmasters in New Delhi need not be rack and ruin for the vast majority constituting the nation's poor and middle classes. Suppose another wobbly government is installed in New Delhi in the first week of June, and suppose it proves hopelessly incapable of putting through a structural adjustment programme which is to the liking of the World Bank and the Fund. Suppose, as a result, no fresh foreign funds of any substantial order are forthcoming and our government is compelled to default on its external payment obligations. The Bank and the Fund would then have to follow the rule book and choke off the

meagre credit still flowing into India. The country's credit rating too would then drop to zero in Western money markets, and, in addition, whatever little private foreign investment was making a hesitant habitat of India, would fly away. All this would without question amount to a major catastrophe from the point of view of the smart set in New Delhi and Bombay speaking the public school patois. True, some more industrial units would face closure, and be compelled to lay off a few more thousands of workers. But look to the other side of the coin. The country would more or less have to do without foreign exchange. It would be forced to abandon economic liberalisation, and to return to the discipline of strictest import control. There would be

no escape from undertaking drastic structural reforms in the economy in these circumstances too. But, mercifully, the burden of these reforms would, for a change, be borne by the nation's rich and affluent. Such a course of events would be extremely bad tidings for self-seeking civil servants and conspiring commission agents. It would break their heart to see the country trek back to the path of economic self-reliance. What is an unfortunate happenstance for them is however a boon for the nation as a whole. The begging bowl syndrome would be over. By all means let us therefore look forward to the prospect of a hung parliament and that of, once more, a severely weak regime in New Delhi. Someone's poison is, after all, someone else's meat.

AGA KHAN FOUNDATION

is looking for a

Programme Officer (Rural Development)

for New Delhi office

AGA KHAN FOUNDATION is a non-communal International Foundation based at Geneva with units in nine countries including India. Foundation is a philanthropic organisation involved in funding social development programmes in Rural Development, Health and Education with scope for innovation and experimentation located in Western India and managed by Voluntary Organisations.

The Programme Officer will report to the Chief Executive Officer. He/she will be responsible for identifying new programmes, proposal writing, budgeting and appraisal leading to approval by the Board of the Foundation, monitoring of funded programmes, assisting in documentation and evaluation. Programmes selected for funding are aimed at improving rural communities through management of land and water resources. He/she must be able to liaise with senior government officials, voluntary organisations and donor agencies. The job involves extensive travelling.

He/she must have professional qualifications in social or agricultural sciences or management with minimum three years work experience with NGOs or other donor agencies. Knowledge of Gujarati would be an advantage. Preference would be given for those in age range of 30-40.

Salary and other benefits would be attractive and commensurate with qualifications and experience.

Applications addressed to Dr. Nisar Siddiqui, Chief Executive Officer, should be received within fifteen days from the date of this advertisement at:

Aga Khan Foundation
Sarojini House, 2nd Floor
6 Bhagwan Dass Road
New Delhi 110 001

Aga Khan Foundation (Incorporated in Geneva, Switzerland)

Eighth Plan: Challenges and Opportunities—XIV

Financing the Plan

Arun Ghosh

In this article, the fourteenth of a series of articles setting out the broad approach of the Planning Commission under the V P Singh government, the author discusses the dimensions of investment in the Eighth Plan and the sources of its financing as envisaged by the Planning Commission in August/September 1990.

IT would obviously be unrealistic today to discuss the financial dimensions of the Eighth Plan, as worked out in August/September 1990. The figures are not important, nor of much relevance today, and are at best of historical interest. What is of importance is the pattern of financing; the broad thrust of the expenditure allocations; and the extent of devolution of resources for bringing about a directional change in the pattern of development of the country towards decentralisation, greater equity, greater self-reliance and a better quality of life for the people.

But then, one has to find a peg on which to hang a picture; and that peg in the present context can only be the broad financial dimensions of a plausible plan outlay, the problem of providing the required finance, the problems that arise in the transition to a different pattern of socio-economic development. Even so, some unrealism must remain in giving any set of financial dimensions of a five-year plan, without the benefit of the latest official data not available to an outsider. Regrettably, even the *Economic Survey* did not get presented to parliament and to the country this year. What is the relevance of the figures dreamt up in August/September 1990 today? It is well known that in the last seven months, there has been a sea change in the economic situation on both the external and internal fronts. Even though crude oil (and oil product) prices have come down after the Gulf War, the country is close to bankruptcy in external payments. Internally, there has been an erosion of government revenues, and an increase in government expenditures (in 1990-91, as compared to the budgeted figures), and the rate of inflation has crossed the double-digit mark. Inaction—or inadequate action—by way of a 'vote on account' for four months rather than a full year's budget for 1991-92, makes the economic situation one of considerable potential danger for the future. Decisions postponed make it so much harder to compress the required

short-term 'adjustment' of the economy within a shorter period, after a new government takes charge following the general elections.

I do not propose to discuss the short-term adjustments necessary, even though as stated earlier the short-term is the precursor of the long term. Nor do I propose to repeat all the figures—which were then mutually consistent—which have now been rendered out of date. In this piece, I propose to unfold three sets of data, and endeavour to present the issues that arise, the issues that will have to be squarely faced, in the context of the type of development envisaged in the philosophic approach unfolded in the earlier articles.

The three sets of data I propose to give are: (a) the latest estimates of the GDP, domestic savings (and components thereof) on the basis of which one may attempt to derive the trend rate of savings, and what needs to be done to contain the increasing dependence of the country on external savings; (b) the broad dimensions of investments and their financing as envisaged by the Planning Commission in August/September 1990; the rationale is merely to indicate (i) the problem of shifting gears suddenly because of the overhang of past commitments; (ii) the manner in which a new thrust can be given to the type of plan programme indicated in the earlier articles; and (c) the problem of devolution of resources from the Centre to the States, which is essential, if the philosophic approach to development outlined earlier is to be accepted, and if the States are to be empowered to take up the task of speeding up the socio-economic development of the backward areas/sections of population.

Why do I persist in giving figures at (b) above? I have so far avoided giving any data which are not officially published (even though I firmly believe that most official data which are today treated as confidential should be in the public domain). First, perhaps it should be stated

that these figures were leaked out by the daily press when the figures were still 'hot', they are no longer a matter of confidentiality but of history. Secondly, and more importantly, the figures have some relevance with regard to their policy implications. The totals would all be somewhat different today, but the policy implications of the pattern of outlay, of resource raising, of Central transfers to States, would remain broadly unchanged. Indeed, the need for urgent action would be even more acute today than a year back.

These 'historical' figures would, *inter alia*, indicate how difficult it is to bring about a social transformation of the type discussed in the earlier chapters. In part, the overhang of past commitments makes it difficult to break away sharply from the past. In part, the extant political-cum-administrative system (with its vested interests) makes it even more difficult to introduce concepts which would make for the efficient use of our limited resources.

At this juncture, perhaps a small digression is necessary. The daily press has reported that the present Planning Commission proposes to keep a draft Eighth Plan ready for the new government by the end of May. That is fine, and is obviously a wise move. But it is also reported in the press that the plan would be drawn up on the basis of an assumed growth rate of the GDP at 6 per cent per annum during the plan period. The only plausible explanation for jacking up the growth rate (from 5.5 per cent per annum, as approved by the NDC in September 1990) to 6 per cent per annum is that the annual growth rate during the Seventh Plan period was 5.6 per cent; how can one project a lower growth rate for the future? Unfortunately, what is forgotten in this euphoria about the past rate of growth is:

(a) that this growth rate—which, incidentally, was approximately known to the then Planning Commission in August/September 1990—was achieved at the cost of both internal and external imbalance of a severe order, neither of which is sustainable; in fact, we will have to pay a heavy price in the future for the policy of mortgaging the future which was adopted in the second half of the eighties; (b) that during the Seventh Plan, despite the impressive overall growth rate (of the GDP), there was a noticeable decline in employment growth, which was lower than the growth of the workforce; (c) that over this period, there was stagnation (and in places even a decline) in output in many parts of the country, increasing the inequality of income, and increasing social tensions and unrest; (d) that it is in this context that the erstwhile Planning Commission felt the

need to spur development effort in the backward (dryland, rainfed) areas where significant investment would be necessary for a few years before any tangible output growth arises; this underscores the need for focusing attention on employment growth rather than growth of aggregate output, which would make for a more egalitarian and 'sustainable' growth in future;

(e) that the present finance minister, Yashwant Sinha, openly talked of the need for (and his determination to introduce) a hard budget for 1991-92, bringing down the 'fiscal deficit' (i.e. total government expenditures minus government revenues, made up by borrowing and by deficit finance) from 8.6 per cent of the GDP to 6.5 per cent, which Sinha was prevented from attempting when he was persuaded to present a vote-on-account for four months rather than a regular budget for the full year; and

(f) that some economists (notably Raja Chelliah, former member of the Planning Commission, and Amaresh Bagchi and Sudipto Mundle) have indicated that 1991-92 may well end up with no more than a 3 per cent real rate of growth—one does not know the growth rate in 1990-91, but the Reserve Bank experts place it at around 4-4.5 per cent over the year—and Chelliah et al have made certain recommendations as to resource raising while pleading for the maintenance of plan outlays, and at the same time suggesting the cutting down of the rate of inflation to 6 per cent for the year in 1991-92 by austerity in regard to administrative expenditures (These suggestions were made before the government opted for a vote-on account for four months in place of a regular budget for the year as a whole.)

Against the above background, any talk of a 6 per cent growth rate during the Eighth Plan is evidence at best of naivete, at worst of cynical propaganda.

As already stated, it is in this context unfortunate that the annual *Economic Survey*—which gives a run-down on the latest economic situation and the latest statistics before the budget in February every year—which was ready and printed, has not been released by the government. One can assume that the *Economic Survey* would have underscored the need for a hard budget, which is why it has been withheld. The future of the economy is obviously of no consequence in the context of political expediency.

At this juncture of the crossroads of Indian history, with external bankruptcy staring us in the face, if a discussion on the financial dimensions of the Eighth Plan is still relevant, it is to demonstrate that it is possible to ensure a balanced growth of the economy by focussing on rural/agrarian development and on employment generating programmes, for these programmes can be pursued without

any adverse impact on the balance of payments; that it is possible to change the direction of the economy away from an energy-intensive and import-intensive pattern of growth; that it is possible to deploy our resources rationally and economically and to stimulate the flow of additional resources by enthusing the backward/depressed sections of society to work for their own development. We need a national consensus on certain objectives and certain policies. We need less of centralisation and of bureaucratic intervention in the detailed working of the economy. We need greater popular participation, through democratic decentralisation, in the process of governance. We need a national debate on these issues if we want to avoid the tortuous path resulting from external and fiscal bankruptcy which has dogged a number of Latin American countries through the decade of the eighties.

FINANCIAL DIMENSIONS OF PLAN

At 1989-90 prices, the aggregate volume of investment over the Eighth Plan period was estimated to be Rs 610,000 crore. Public sector investment was placed at

Rs 200,000 crore, or 33 per cent of total investment; and total public sector plan outlay at Rs 335,000 crore.

To be able to understand these figures, it is desirable to start with a brief picture of the GDP, the domestic savings and investment rates, and the state of government finances during the Seventh Plan period. Table 1 gives the relevant magnitudes.

First, it must be noted that the figures quoted in Table 1 are somewhat different from those which can be seen in some official publications (including the *Currency and Finance Report* of the RBI), and also different from those used in earlier articles. These figures have been derived from *Quick Estimates of the National Accounts* for 1989-90 released by the CSO, supplemented by revisions made by the CSO to figures for the earlier years (obtained from the CSO). What is important are not the precise figures but the dimensional magnitudes. Two significant developments over which everyone is agreed are: first, that household savings (which include the savings of unincorporated enterprises) have shown a remarkable increase over the past three

TABLE 1. PATTERN OF SAVINGS IN INDIA

| | 1985-86 | 1986-87 | 1987-88 | 1988-89 | 1989-90 | Total During Seventh Plan |
|---|-------------------|--------------------|--------------------|--------------------|--------------------|---------------------------|
| 1 Household saving in financial assets | 18514 (7.1) | 22292 (7.6) | 26022 (7.8) | 28646 (7.2) | 39386 (8.9) | 134660 (7.8) |
| 2 Household saving in physical assets | 19485 (7.4) | 17704 (6.1) | 28696 (8.6) | 38793 (9.8) | 39527 (9.0) | 144205 (8.4) |
| 3 Total household saving | 37999 (14.5) | 40696 (13.6) | 54718 (16.4) | 67239 (17.0) | 79813 (18.0) | 278865 (16.2) |
| 4 Private corporate saving | 5208 (2.0) | 5040 (1.7) | 5594 (1.7) | 8116 (2.1) | 9379 (2.1) | 33337 (1.9) |
| 5 Saving by government administration | (-1474) (-0.2) | (-12400) (-0.8) | (-15384) (-1.6) | (-18453) (-2.1) | (-12208) (-2.6) | (-128919) (-1.7) |
| 6 Saving by govt departmental enterprises | 1419 (0.5) | 1494 (0.5) | 2077 (0.6) | 2602 (0.7) | 3149 (0.3) | 10741 (0.6) |
| 7 Saving by govt non-departmental enterprises | 7512 (2.6) | 8908 (3.0) | 10556 (3.2) | 13594 (3.4) | 16684 (3.8) | 57254 (3.3) |
| 8 Total domestic saving | 51664 (19.7) | 53738 (18.4) | 67561 (20.3) | 83298 (21.1) | 95917 (21.6) | 351458 (20.4) |
| 9 GDP at market price | 261920 | 291974 | 332616 | 394992 | 442769 | 1724271 |
| 10 Gross domestic capital formation at current prices | 62946 (24.0) | 67230 (23.0) | 75386 (22.7) | 94367 (23.9) | 106501 (24.1) | 406430 (23.8) |
| 11 Use of external saving as percentage of GDP (derived from above figures) | (4.3) | (4.6) | (2.4) | (2.8) | (2.5) | (3.4) |

Note: Figures in parenthesis are percentages of the GDP.

Source: CSO, 'Quick Estimates of National Accounts', 1989-90, plus revised data obtained from the CSO for earlier years. These figures are marginally different from those given in NAS 1989 and NAS 1990. The derived figures of external saving would be different from the RBI figures, based on balance of payments data.

years; and, secondly, this has been offset by a steady decline in savings of government administration which have indeed reached a *dissaving* figure of 2.6 per cent of the GDP by 1989-90. The Diagram brings out vividly the steep decline in government savings in the eighties. (In the diagram, savings of government administration and departmental enterprises have been combined.)

The other disconcerting feature revealed by the data given in Table 1 is the very heavy reliance on external savings, which implies a heavy deficit in the current account of the balance of payments which, as already noted earlier, is not sustainable. Nor indeed is the 'fiscal deficit' of the Central government sustainable, as it is leading both to a rapid increase in interest payments and inflationary deficit finance.

The most heartening feature of the trends revealed by the data given earlier is the rapid spurt in household savings. Private corporate savings have also increased and, hopefully, would increase further, if the private corporate sector is to play its appointed role in speeding up industrial growth.

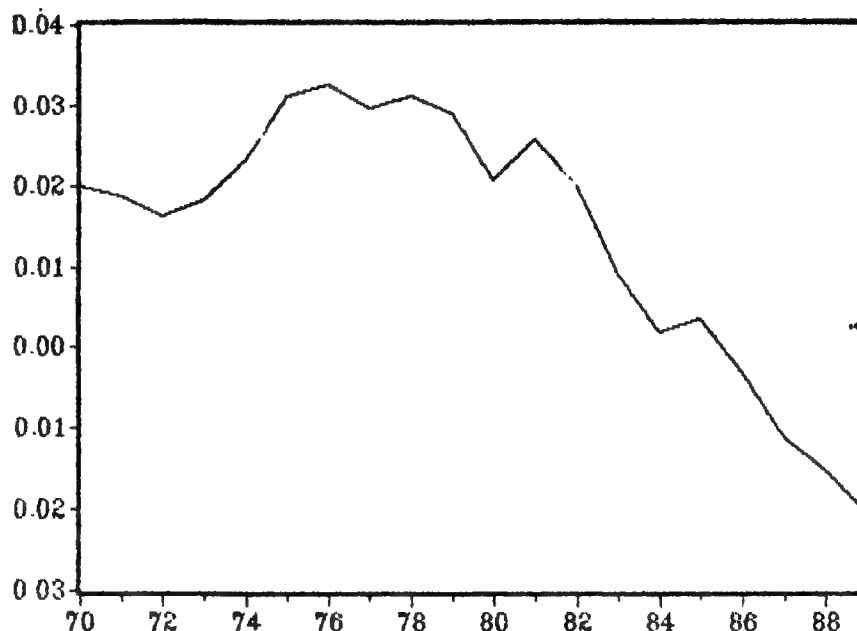

The inescapable conclusion is that if there is a crunch of resources today—and a likely crunch of resources in the coming years—it is in respect of the government sector. It is essential to: (a) increase the resources available with the government (to enable it to take up socially desirable expenditures), and (b) to reduce the dependence on external saving. In operational terms, it means that government *dissaving*, which had reached 2.6 per cent of the GDP by 1989-90, would need to be very largely eliminated over the next plan period.

There is, to this end, need for both curtailment of government expenditure and bolstering government revenues, in order to restore a balance in the economy. The balance of payments needs a two pronged attack: the restoration of a better balance between aggregate demand and supply would by itself partly improve the payments position, though there is no 1:1 relationship between the two; hence, secondly, one would need to look for separate ways to improve the payments position, by boosting exports and eliminating inessential imports.

How does one raise the resources for the public sector, to meet the investment requirement of Rs. 280,000 crore at 1989-90 prices, a step-up of 27 per cent in real terms over the investment during the Seventh Plan period?

There are several ways in which one could attempt to make projections for the future, with reference to the figures given in Table 1. One could attempt to fit long-term trends to various segments of saving other than the saving of government administration, for the latter depends on autonomous decisions of the government.

DIAGRAM 1: SAVINGS OF GOVERNMENT ADMINISTRATION (AND DEPARTMENTAL ENTERPRISES) AS A PERCENTAGE OF GDP

For the other categories, one could attempt to derive savings as a function of real income of the sectors involved. For example, household saving in physical assets may be deemed to be a function of either agricultural income (in real terms) or aggregate household income (in real terms) or of both. Similarly, household saving in financial assets could be derived as a function of non-agricultural household income or aggregate household income or both. One gets a reasonable fit, with significant values, if one takes a long enough series, say from 1970-71. But then, there arise genuine statistical problems in putting together estimates at constant prices over a long period when the structure of production has been undergoing rapid change. No clear trends are discernible if one takes only the last five years, or even the last decade. The recent years show a markedly different behaviour from the past. On the basis of a long-term functional relationship, one would derive a rising trend of household saving in financial assets, which is almost neutralised by a declining rate of household saving in the form of physical assets, a feature belied in the last three years.

There arise other problems. A decline in direct investment (of household saving) in physical assets could well occur in the absence of any policy action calculated to encourage just the reverse. With the focus on local 'watershed area planning', and on rural development generally, promoted by some form of Employment Guarantee Scheme, it is difficult to envisage a decline in the proportion of household saving in physical assets; in fact, the proportion should increase in the future, despite a long-term declining trend.

There is a further problem. Personal

saving in the form of financial assets has been growing steadily in the past. However, having reached a figure close to 9 per cent of the GDP, it is possible that this form of saving could taper off. This could well happen if tax rates need to be raised (in relation to the GDP) to bolster government revenues and to cut down the fiscal deficit in order to bring down inflation. This is an issue on which experts hold divergent views, and there is not enough evidence to establish any unique relationship between savings of households in the form, say, of time deposits with banks and household income. Nor do we have any data on the distribution of income, which may well be a factor in the recent growth rate of financial savings of households. Perhaps one could assume that such savings would increase at best slowly, or at least not decline, even though savings of households in the form of physical assets would go up (and not decline as one would be inclined to forecast from past trends over a longish period).

The brief point of this digression is that for the future, one would need to *assume* certain rates of saving, and not predict them with any great assurance on the basis of past trends.

Turning to the other elements of saving in the economy, one may reasonably assume that savings of both the private corporate sector and of non-departmental public enterprises would increase.

But then, if the savings of all sectors other than government administration were to increase, and if the dissaving by government were to decline, there could arise the possibility of a faster rate of economic growth than assumed all through, namely, at around 5.5 per cent

per annum on an average. With the focus of investment on less capital-intensive forms or processes of production, are the prognostications regarding savings consistent with the rate of growth of the economy assumed?

Two points are important to remember in this context. First, the rate of investment in India has been quite high in the recent past, and a good part of it has been financed by borrowing from abroad, which needs to be drastically reduced. Secondly, we need to direct, for quite some time to come, large sums of money for education, health care, nutrition of the mother and child et al and such social investments are not likely to increase the GDP, though the quality of life would certainly improve. The same goes for outlays for environmental protection; investments made in this behalf are not likely to increase output but improve the quality of life.

Investments on infrastructure are likely to be capital-intensive, and are also likely to have a long gestation period. Heavy investments are necessary for the improvement of rural infrastructure. The pay-off would come after a few years, not immediately.

It must be recognised that when one goes in for a major reshuffling of the pattern of investment, there are certain to arise problems with forecasting the future output. Mechanistic projections are not likely to be realistic. And yet, a directional change in the pattern of investment in the economy is the need of the hour. It would be wrong to turn the focus away from social investments, which form the crux of the strategy to be followed. At the same time, the income of large sections of the rural population has to be buttressed, and to begin with, this would have to be achieved through direct transfer payments. The strategy is to provide a minimum of income to all households. That would lead to a change in the distribution of income and of consumption, the immediate effects of which on savings cannot be forecast. One can say with certainty that after an initial period, of say three years or so—the time taken to derive the fruits of local area development planning—the growth rate of the economy would accelerate. But one should not start counting the chicken before they are hatched. The programme is still only on paper. There has been no purposive intervention yet to change the situation. A national debate is necessary, a national consensus has to emerge on the path of development that India should pursue in the coming years.

It is in this background that the greatest importance attaches to the problem of increasing the resources available with the public sector. These resources are not to be squandered, but deployed in the manner indicated in the earlier articles. One

has to be careful about the strategy. But that is not what we are discussing at this moment.

PUBLIC SAVINGS

During the Seventh Plan period, total public sector savings averaged about 2.1 per cent of the GDP, which was lower by about 1.5 percentage points over what was achieved in the Sixth Plan period. As would be seen from Table 1 earlier, this decline in overall public sector savings occurred in spite of better savings performance by public enterprises which (though lower than targeted) constituted about 28 per cent of total plan outlay and was 3.3 per cent of the GDP in the Seventh Plan. (These ratios may be compared to 22 per cent of plan outlay and 2.7 per cent of the GDP in the Sixth Plan.) Government administration (plus departmental enterprises) had a *negative savings* rate of 1.1 per cent of the GDP in the Seventh Plan period. In 1989-90, the terminal year of the Seventh Plan, this dissaving had reached 2.3 per cent of the GDP. This deterioration occurred despite an increase in government receipts as a percentage of the GDP—from 15.5 per cent in the Sixth Plan to 17.1 per cent in the Seventh Plan. Unbridled expansion of government administrative expenditure, including expenditure on defence and on 'internal security' contributed to the fiscal deterioration. Government's current expenditure (purchase of goods and services, wages and salaries, interest on public debt, subsidies, transfers, etc, in-

creased from about 15.6 per cent of the GDP in the Sixth Plan to as much as 20.3 per cent in the Seventh Plan. In the terminal year of the Seventh Plan (1989-90), such spending constituted about 21.5 per cent of the GDP. This order of outlay was made up of purchases of goods and services and wages and salaries (11.2 per cent), interest on public debt (3.4 per cent), subsidies (3.8 per cent) and current transfers (3.1 per cent).

The report of the Ninth Finance Commission underlined the need for arresting this fiscal deterioration, as did the paper 'Approach to the Eighth Five-Year Plan' (approved by the NDC). One can only reiterate that there is need for firm government resolve (and action) for every possible economy in government expenditure. There is need for a distinct increase in austerity in government expenditure, not merely a call for national austerity.

There are certain obvious limitations to suddenly bringing down any set pattern of expenditure. Past commitments, e.g. interest on public debt already incurred, have to be provided for; the best one can hope for is to restrain such outlays from increasing fast, or at any rate, reduce such outlays as a percentage of the GDP. This would involve greater reliance on current revenues, and a tightening up of all avoidable expenditure. What one can hope for is the *containment* of future commitments (of administrative and defence expenditure) and, in consequence, a much slower rate of growth of such expenditure: (a) in relation to past trends, (b) in rela-

plan expenditure), (c) in relation to the growth of revenues, and (d) in relation to the GDP growth.

The two biggest growth items in government current expenditure today are: interest on public debt, and defence. The former can be contained only by a reduction of the fiscal deficit which has been increasing at a frightening rate. This would involve less reliance on borrowing, both internal and external. The latter—i.e., less external borrowing—is in any case essential for restoring viability in our external payments. The former calls for increasing the reliance on current revenues rather than on borrowing for meeting government expenditure. All this is elementary public finance. Unfortunately, there is a section of informed public opinion which feels that tax rates are already quite high in India, and that higher taxes will impinge on private saving. This notion is wrong: (a) because taxation can be properly targeted (to those who can afford to pay, and who are today creating numerous problems by lavish consumerism); (b) because higher taxation would be a better way of restoring balance in the economy than an indiscriminate credit squeeze, which is the usual knee-jerk reaction of administrators in charge of finance and credit; and (c) because while wasteful government expenditure needs to be curtailed, there is need to increase government outlay on high priority social needs like education, health services, etc., and in fact, for some type of Employment Guarantee Programme, in order to deploy the unemployed labour force for local area development planning.

Incidentally, it is worth mentioning at this juncture that South Korea, Taiwan, China—countries frequently cited for emulation—have all had gross savings rates of some 30 per cent plus, as a percentage of the GDP, for quite some time. India also needs to opt not only for a high rate of investment but also for a significant decline in dependence on external savings to spur economic growth. Again, in this context, today there are many experts who advocate the free inflow of external capital to bolster our internal savings and our growth rate; and to this end, the recommended prescription is the 'globalisation' of the Indian economy. It is forgotten in this context that private external capital would tend to concentrate on a pattern of development which is both capital-intensive and energy-intensive, both of which will militate against the type of investment for which we have argued all through the earlier articles. We do need external capital and technology, but we need to be selective as to the sectors into which such capital inflows take place.

First, then, as to the urgent need to curtail/contain our defence expenditure. The

total expenditure on defence (including civil defence services) in 1990-91 (Revised Estimate) was Rs. 17,684 crore, and is budgeted for 1991-92 at Rs. 18,855 crore. These are figures of current outgo. To the extent that a significant part of equipment purchase abroad is on deferred payment terms, the actual liability incurred is greater. (Incidentally, even these estimates of cash outgo (for 1991-92) are likely to be gross underestimates because, as per the finance minister's own statement, no allowance has been made for additional dearness allowance to be paid. But that is separate issue.)

What is really required is to minimise the expenditure for the acquisition of military hardware from abroad. The total expenditure on 'Stores' by the army, navy and the air force is stated to be Rs 4,641 crore in 1990-91 and Rs 4,717 crore in 1991-92. Deducting the payment made to Ordnance Factories (Rs 1,514 crore and Rs 1,620 crore respectively), one gets estimates of Rs 3,027 crore and Rs 3,097 crore as the payment for all other Stores purchases in 1990-91 and 1991-92, respectively. Import payments (for military hardware) may be expected to be significant part of this outlay, say, between Rs 2,500 crore and Rs 3,000 crore annually. At the modest figure of Rs 2,500 crore, this saving would be close to 0.6 per cent of the GDP. However, it is well known that these are only the current payments, most items of defence equipment are obtained on deferred payments basis. All that one can do, therefore, is not to make any large fresh commitments, so that future payments may be frozen at the levels required to pay for past imports (on deferred payments basis). This is one area where a reduction in expenditure would lead to a corresponding reduction in import payments, on a 1:1 basis.

In regard to defence expenditure, the key question to be frontally posed is: what external danger or overt external threat do we perceive, and from whom? From China? That is unlikely. From Pakistan? We tend to forget that the more we arm ourselves the more we provoke others to enter into a competitive arms race. We should cry a halt to the import of sophisticated weapons; we should desist from increasing military expenditures. India does not need either nuclear-powered submarines or aircraft carriers. We should resort to diplomacy and reduce tensions across borders. Defence expenditure is not likely to come down; but halting an increase in defence expenditure will bring it down sharply as a percentage of the GDP.

There is need also to reduce our expenditure on 'internal security', today hidden under a large number of seemingly innocuous budget heads. The need for paramilitary forces arises because we are averse to meeting the genuine needs of the

people to the decentralisation of authority for decision-making on local issues.

We need all the resources we can garner to speed up the development of backward areas. That is the surest guarantee of internal security.

There are many other ways of containing government expenditure, but it is not necessary to dwell on them here. What is required is genuine austerity in government administration. We also need to curtail/contain the steadily burgeoning subsidies. We had occasion to see how the extant system of control over fertiliser investment and pricing has led to a steadily increasing cost of fertiliser manufacture. A change in the system could bring about a significant reduction in the subsidy on this account without harming anyone, either the farm sector or the producer of fertilisers.

In a recent study on subsidies entrusted to the National Institute of Public Finance and Policy (NIPFP) by the erstwhile Planning Commission, Sudipto Mundle and Govinda Rao have found that in 1987-88, taking the Centre and 14 major States, the total subsidy given amounted to more than 14 per cent of the GDP. (Sudipto Mundle and M Govinda Rao: 'The Volume and Composition of Government Subsidies in India, 1987-88', pp 1157-72 of this issue.)

It is not necessary to go into all the findings of Mundle and Rao. Some of the broad findings of the study can be restated thus. First, the subsidies are not necessarily properly targeted. For example, of the total cost of providing higher education, only 1.7 per cent is recovered from the students—the benefits of the implied subsidy obviously going to the relatively more affluent sections of the population. We do not even know that some of the supposedly profitable sectors (pertaining to government enterprises) involve a subsidy because the cost of interest and depreciation on the capital assets (of departmental undertakings) is not reckoned as part of the cost. For instance there is an implicit subsidy of 30 per cent of cost even for the communications sector under the Central government; and it is not realised that there is a heavy subsidy even in the recovery of costs of electricity supply by the Centre because the interest on capital and depreciation are not properly accounted for. Secondly, subsidies to public sector enterprises (through budgetary support) added up to as much as Rs 15,080 crore in 1987-88. These are not even reckoned as subsidies; and for a GDP (at market price) of Rs 3,32,616 crore, this works out to more than 4.5 per cent of the GDP. To recall an earlier discussion, the financial implication of the Right to Work—ensuring work for every person at the minimum official wage rate—was esti-

mated, at 1989-90 prices, to be of the order of Rs 13,000 crore. This is only some 40 per cent of the budgetary support extended to public enterprises.

Mundle and Rao's conclusions are best stated in their own words:

Pure transfer payments are transparent and their beneficiaries are explicitly targeted. Unfortunately, such direct transfer payments are still relatively small in India. By comparison the total volume of subsidies in 1987-88 was more than ten times as large and it turns out that the bulk of this subsidy was not visible. The explicit subsidy, as revealed in the budgets for 1987-88, amounted to only Rs 5,982 crore.

We must also reconsider in this context the issue of budgetary support to public enterprises. Our estimates show that over 35 per cent of government subsidies have been flowing to these enterprises.

One may or may not agree either with all the assumptions or even the conclusions of Mundle and Rao, nevertheless, if the findings of their study have been quoted at such length here, it is because the issue would have considerable significance in the context of raising resources for the Eighth Plan, and the problem of targeting Central Plan outlays in a manner discussed in the previous articles.

FINANCING THE PLAN

It is in the above context that one has to devise ways to finance the public sector investment outlay of Rs 280,000 crore during the Eighth Plan, and a total public sector plan outlay of Rs 335,000 crore (all at 1989-90 prices) during the five-year period.

Since we are talking in terms of 1989-90 prices, the inflation that has occurred during the past one year does not affect the argument, since in current values, there would be a corresponding increase in the GDP values (though government revenues do not automatically increase in the same proportion as inflation in prices).

Let us make certain assumptions in regard to the pattern of savings, in relation to the estimated growth of the GDP (on the basis of the latest CSO figures of GDP in 1989-90) and see the order of savings that might emerge, and what further needs to be done, to steer the economy out of the difficult transitional period, when the gains from social investments and area development planning may not get translated into accelerated growth. Table 2 will illustrate the broad nature of the possibilities/problems.

Some clarifications are in order. First, in the Seventh Plan, the total government draft on household savings in financial assets was 85 per cent, this is being reduced in order to allow greater freedom to private corporate investment to tap the capital market for industrial investment. Secondly, the difference between government plan outlay and government invest-

ment pertains to social investments, which are part of government current expenditure and therefore subsumed in row 6 of Table 2. The savings of government on this account are assumed to be zero, but obviously this would have to be achieved after providing the required funds for current plan expenditure. Thirdly, the total finance available to government is in excess of government investment by Rs 34,000 crore plus. This would be required partly to augment foreign exchange reserves, which are now too low for comfort, and partly for transfers to finance investment by the private sector. This would *inter alia*, bring down the net payment for interest on debt, via financial institutions. Finally, and most importantly, in the above calculations, no specific provision has been made for the finance required for implementation of the Right to Work. The Employment Guarantee Programme was estimated to cost some Rs 13,000 crore annually, or some Rs 65,000 crore over five years. This can be provided (a) partly by saving on the present, widely scattered Centrally Sponsored Schemes, which can then be deployed for the implementation of the Right to Work and the implementation of local area development programmes, by devolution of the finances to locally elected panchayats, (b) partly by cutting down on some subsidies (examined in detail by Mundle and Rao and referred to earlier) and converting them to explicit transfers, calculated to guarantee employment and a minimum income to every job seeker, and (c) partly by deploying the 'investible resources' available with government for investments for the improvement of the rural infrastructure (which will also help to increase employment).

It may be added that all the above figures are dimensional and illustrative. They are all out of date. Instead of trying to adjust and re-adjust all these outdated figures, the nation should prepare for a fresh plan, based on realistic figures at 1990-91 prices, and the latest estimates of the macro aggregates which are known only to government economists.

It must be repeated that if the dissaving of government administration and departmental enterprises taken together were to be eliminated, the rest of the economy had already attained a saving rate of 23.9 per cent of the GDP in 1989-90. The focus, therefore, has to be essentially on the curtailment of administrative expenditure (especially unproductive expenditure), on the proper targeting of subsidies, on the efficient use of resources through the convergence of services. Equally, if the current transfers involved in programmes like the IRDP/JRY (and other schemes under the Department of Rural Development) were to be deployed for 'investment' purposes, as part of local area planning (e.g., for the improvement and reshaping

of land and land levelling, contour bunding, terracing, planting of trees, small irrigation works calculated to improve the soil-water combination in dryland areas), there would be a noticeable increase in publicly financed rural investment. Such investment is likely to induce additional investments by the rural sector directly in the form of physical assets. While basic land improvement investments may not yield any output for a couple years or even more (depending on the type of improvement required), there would be a spurt in output after a few years. Such investments, of the classic Nurkseian variety, namely, the mobilisation of unemployed (or under employed) labour for the creation of long-term assets calculated to improve the productivity of labour, are to be a major feature of "watershed area planning". The success of such a programme would depend on the extent to which we succeed in the experiment on 'decentralisation', the extent to which we are able to provide back-up support for effective local area development plans. However, we must accept the reality; such efforts at local area development planning may begin to yield fruit only after two or three years, at the earliest.

Thus, two consequences would follow. Many of the 'current transfers' would become of the nature of 'investments' thereby putting scarce resources to best use. Secondly, though these investments may not yield immediate results, their gestation period would be very much shorter than the gestation period of large investments. Investments on infrastructure development must be made, but even part of such development, e.g., on rural roads can be partly funded through such use of surplus labour, through implementation of the Right to Work.

The key to these changes is a restraint on the dissaving by government administration, together with decentralisation of planning effort.

Two further points need re-emphasis. First, the total amount of deficit financing is to be contained Rs 30,000 crore (at 1989-90 prices) during the Eighth Plan. It is noteworthy in this context that actual deficit finance during the Seventh Plan had reached Rs 28,000 crore (at 1984-85 prices) as against the plan target of Rs 14,000 crore. Secondly, the current account deficit in the balance of payments is projected to fall to some one per cent of the GDP by 1994-95. For the plan period as a whole, this implies an average deficit of 1.7 per cent of the GDP.

The other important prognostication in the context of raising of resources is that the public sector plan outlay is to be financed very significantly by the surplus of public sector enterprises. Such surplus (of non-departmental public enterprises, at Rs 92,894 crore) would amount to nearly one-third of the public sector plan

outlay of Rs 280,000 crore; and if the surpluses of departmental enterprises are added (which are mixed up in Table 2 with government administration) the contribution of public enterprises would amount to a significantly large proportion of the total.

STATE PLANS: SIZE AND FINANCING

One of the problems that has been becoming acute of late is the steady erosion in the resources of the States. Table 3 below gives the pattern of financing of Central and State plans, again at 1989-90 prices, which had been suggested in August/September 1990. This table has no relevance except insofar as it helps to pinpoint the importance of greater devolution of resources to the States (and via the States, to the local authorities). Incidentally, these figures would not tally with the prognostications made in Table 2 earlier. Again, the figures are not relevant the dimensional magnitudes and the problems they point up are what the nation should debate.

The figures in Table 3 have no particular relevance as of now, but are yet important because they underline that even the erstwhile Commission found it difficult to restore better parity between Central and State plan outlays because of: (a) the overhang of past commitments of the

Centre, and (b) the need and the urgency of a rapid build-up of infrastructure, especially in the areas of energy and transport.

Two especially important issues that arise in this context are: (a) the magnitude of Central assistance for State Plans, and (b) the future of the Centrally Sponsored Schemes.

The transfer of Rs 57,000 crore to the States (excluding Rs 3,000 crore to the Union Territories, which is shown as part of the Central plan), plus Rs 7,700 crore of plan deficit grants makes for a total of Rs 64,700 crore at 1989-90 prices. This is not enough, considering the gigantic tasks ahead of the States, for funding rural development, for education, health, nutrition and allied services, for urban development.

As of today Centrally sponsored Schemes (CSS) still remain under the control of the Centre. The major schemes in this context are the employment-oriented schemes (rural and urban); the family planning programme; the ICDS and the Accelerated Rural Water Supply Scheme. They account for roughly Rs 3,373 crore, or roughly 61 per cent of Central outlay on CSS as per the 1990-91 budget (B E). No decision has yet been taken in regard to the transfer of such schemes to the States, to devolve these funds to the locally

elected panchayats, so as to: (a) make them an integral part of area development plans; and (b) make for greater efficiency in resource use through the 'convergence' of related services.

It had been seen earlier that at 1989-90 prices, the total financial outlay required to implement the Right to Work may involve some Rs 13,000 crore or thereabouts annually, or some Rs 65,000 crore over a period of five years, for which no specific provision has been made even in Table 2. The only way to implement such a programme would be to: (a) empower the elected local bodies to prepare local area development plans; and (b) enable elected local bodies to implement the Right to Work by providing them with the required finance. The funds currently available under the employment programmes are: (a) Jawahar Rozgar Yojana, budgeted for Rs 2,100 crore in 1990-91 and revised downward to Rs 2,000 crore in the Revised Estimate; and (b) Nehru Rozgar Yojana (for urban areas) budgeted for Rs 120 crore in 1990-91 and revised downward to Rs 110 crore in the revised Estimate; or a total of Rs 2,110 crore in 1990-91. There are numerous other budgetary heads for watershed area planning, crop husbandry support, self-employment programmes—all Central programmes. We have gone over the issue of devolution of funds, of

a basic restructuring of the planning process from a bureaucratic planning framework to a people-oriented plan programme. We have seen earlier how it may be possible to provide the required finance, by a reduction of subsidies, and by converting the present 'transfers' to individuals to investment funds used for area development. The purpose of giving the detailed figures of resource allocation as per Table 3 is that even a commission imbued with a vision of the need to bring about a social transformation of the economy found itself: (a) weighed down by the overhang of past commitments; (b) tied down by ministerial prerogatives and disinclination to shed authority and finance; and (c) unable to give concrete shape to some of the most cherished ideals because of organisational weaknesses, such as the inability of the government to bring about popular participation in the planning process, through democratic decentralisation.

Some of the problems would be clearer from the proposed sectoral allocations as compared to actual outlays in the Seventh Plan. It is instructive to note that out of the allocation of Rs 23,500 crore for large and medium industry, as much as Rs 18,500 crore represent the requirement of funds for ongoing schemes, Rs 4,000 crore were meant for the States plans, and only Rs 1,000 crore left for new Central projects. This was intended to only support the new equity contribution to such projects as could find the required resources from the capital market/financial institutions, based entirely on their bankability/profitability. The allocation for large and medium industry was thus

to be drastically cut to some 7 per cent of the total plan outlay, from more than 12 per cent of plan funds allocated to this sector during the Seventh Plan.

Nevertheless, there still remained three major weaknesses in the programme of plan finance. In the first place, there was not enough devolution of resources to the States, which had a total plan size of only Rs 152,200 crore out of the overall national plan of Rs 335,000 crore—only 45.4 per cent of the total plan—when the process of social transformation really required a complete reversal of past trends, and focus on rural development, education, health, social welfare and raising the income and levels of living of the backward sections of the people. There was no agreement as to the transfer of the Centrally Sponsored Schemes to the States, which had the potential of being used to buttress the local area development plans (and at the same time, subserve the objectives of the CSS).

The second major weakness of the allocations/financial provisions was that the very estimate of States resources—in terms of balance of current revenues—was unrealistic, against the background of the actuals for 1989-90. Almost all the States were in the red; the non-mandatory suggestion of the Ninth Finance Commission as to revenue deficit grants could be given effect to in 1990-91 only partially. Judging from past trends, the States are unlikely to have a balance from current revenues of Rs 10,140 crore (at 1989-90 prices) during the five-year plan period. As is generally known, States revenues are much less elastic than those of the Centre; and the fundamental principle of

public finance—that decentralised delivery of services is always more efficient—has been systematically flouted by the Centre. Indeed, this has become such a habit that it is now customary for the Centre to treat the States as supplicants, to be doled out funds if they behave.

The third major weakness of the financial provision was that the requirement of funds for any kind of 'employment guarantee' was given the go-by. Even if one were to devolve not only all the CSS but many other Central schemes (which can and should be used for area development plans), the totality of funds available was still short of the funds required to enable anyone to demand eight hours work for the statutory minimum wage for eight hours physical work. Table 2, and some general suggestions made thereafter may take care of this problem, but then, the required funds need to devolve down, and not kept by the Centre, in the name of a Centrally Sponsored Scheme for Employment. It may be expected that when self-employment opportunities improve (through area development plans) the demand for employment (under the Employment Guarantee Programme) would decline. Unfortunately, the process of drawing up area development plans for each village, through decentralised planning—which requires the institutional framework of an elected panchayat system—has not even been initiated yet.

It is against this background that the prime need of the country today is not a higher rate of growth of the GDP, but a more balanced growth of all regions, a growth of employment opportunities faster than the growth of the workforce, a programme which will raise the quality of life of the backward sections of the population, which will automatically reduce the rate of growth of the population.

The financial dimensions of the Eighth Plan drawn up in September 1990 is a matter of history. When a new government and a new Planning Commission take charge in June 1991, it will have to face some very hard realities in terms of both external and internal balance, in terms of alternative paths of growth where the past trends—with their energy and capital intensity—point to catastrophe, and where decentralisation, a focus on a more rational pattern of development based on our own internal resources point the way to long-term viability.

It is likely that such a choice may not be made either voluntarily or easily by any Central government. This is why there is particular need for a national debate on the issue. This is why even some outdated, unrealistic dimensional figures given earlier may help to encourage such a debate.

TABLE 3. PROPOSED PUBLIC SECTOR OUTLAYS IN EIGHTH PLAN

| | Seventh Plan Actuals | | Eighth Plan Proposed (at 1989-90 Prices) | |
|---|----------------------|------------|---|------------|
| | (Rs Crore) | Percentage | (Rs Crore) | Percentage |
| 1 Agriculture | 12,861 | 5.79 | 20,000 | 5.97 |
| 2 Irrigation and flood control | 16,456 | 7.40 | 27,000 | 8.06 |
| 3 Rural development | 18,672 | 8.40 | 30,000 | 8.96 |
| 4 Social services | 33,397 | 15.02 | 60,000 | 17.91 |
| 5 Energy | 63,554 | 28.59 | 104,000* | 31.04 |
| 6 Transport | 30,329 | 13.64 | 41,800 | 12.48 |
| 7 Industry and minerals | 30,266 | 12.62 | 30,500 | 9.10 |
| Of which | | | | |
| Large medium | 26,976 | 12.14 | 23,500 | 7.01 |
| Small village | 3,290 | 1.48 | 7,000 | 2.09 |
| 8 Communications and information and broadcasting | 10,224 | 4.60 | 15,200 | 4.54 |
| 9 Science, technology and environment | 2,983 | 1.34 | 5,500 | 1.64 |
| 10 Others | 3,552 | 1.60 | 1,000 | 0.30 |
| Total | 2,22,294 | 100.00 | 3,35,000 | 100.00 |

Note: * This included an allocation of Rs 24,000 crore for Petroleum and Natural Gas against Rs 16,008 crore actually invested during the Seventh Plan. However, the ONGC/OIL were to be empowered to plan for and to place the requisite orders for raising crude oil output to 52 million tonnes by 1994-95, estimated to require a total sum of Rs 35,000 crore approximately, to be made up from shortfalls in other sectors/additional resources. This was done consciously in the interest of reducing the import dependence on crude oil/oil products.

Charade of Preparing the Eighth Plan

BM

The present Planning Commission has neither the political authority nor the policy direction to try to put together the draft of the Eighth Plan. The planners should, therefore, avoid being pushed into unviable positions by a group of self-serving politicians with populist pretensions.

THE air of uncertainty combined with lethargy and purposelessness that currently pervades in Yojana Bhavan is palpable; the position is worse than what obtained at the close of the Third Plan which stalled the launching of the Fourth Plan. There is yet another notable difference in the present condition and environment so far as development planning is concerned. If the decision to go for a three-year plan holiday in the mid-sixties was a deliberate one, there is a mindless drift into a plan holiday at present. If during the earlier plan holiday period, annual plans were formulated with great care and caution under the leadership of the late D R Gadgil and this subsequently helped resumption of medium-term, five-year planning, the plan holiday currently is tending to be absolute with little chance of medium-term planning being resumed seriously, unless there is a major political intervention in its favour.

Whatever work is going on in Yojana Bhavan presently is not only fitful but is lacking in conviction and credibility and is devoid of any perspective as well. The planners are being prodded into work which merely panders to the whims and fancies of their political boss, Chandra Shekhar. This tendency seems to have ironically gained strength after Chandra Shekhar has been turned into a caretaker prime minister. It is remarkable that he has tended in that capacity to develop added spunk and recklessness. This is evident from the manner of his handling of political issues, among them the elections in the Punjab and Assam. On the economic front, apart from much else, similar was his decision to hold a meeting of the National Development Council. His direction to adopt a minimum 6 per cent growth target for the Eighth Plan, presumably for a presentation to the NDC, placed the planners in an awkward position. The planners dutifully resumed work on drawing up the plan with a 6 per cent growth rate. But even the hand-picked

planners found it pointless to face the NDC in the prevailing conditions. They conveyed their diffidence to the boss. Since some of the chief ministers also voiced their unwillingness to attend the proposed NDC meeting on April 24, when the general elections would be due to be held shortly, Chandra Shekhar had to drop the idea of holding the NDC meeting. This was sensible of him, especially so since his remaining in the office as prime minister after the elections can be ruled out in spite of the heroic pretensions of his camp-followers about opportunities that may again become available to him in the event of a hung parliament.

Significantly, V P Singh when he was prime minister still with a sound support in parliament had referred to the prospect of a plan holiday which the government could be forced into if the public sector did not help in meeting investment targets. Thus the NF government too was being pushed into a plan holiday position. In other words, the social, political and administrative environment was already tending to be such that development planning was being pushed very much down the agenda of the government as well as all the mainstream political parties. The position in all these respects is much worse at present. The election manifestos of all the parties make this position stark.

After the Approach to the Eighth Plan was defined with impressive aplomb and speed by the planners under the NF government and approved by the National Development Council, the work on drawing up the draft plan on the basis of the approved approach visibly slowed down, if it did not get stalled altogether. A session of the NDC for a review of the Centre-State financial relations and the Gadgil formula governing the devolution of resources from the Centre to the States could not be held because of the political uncertainty and instability which had by then erupted. The debate on development

planning, both inside the NF government and outside it among political parties and in academic circles and the media had run on predictable lines. The attempt to step out of the conventional groove and 'reorient' the planning process and priorities in tune with popular needs and aspirations was found disturbing by the votaries of the *status quo*. There were no figures in the Approach Paper on the Eighth Plan, it was pointed out with scepticism, even contempt. This was something not in line with the conventional style of planning. Where were the nuts and bolts, the figures to bandy about, the critics asked. The target of 3 per cent employment growth rate mentioned in the Approach Paper was dismissed as of no relevance unless the growth rate and size of the plan was fixed. The politicians and administrators as well as some figure-happy advisors in Yojana Bhavan itself were greatly upset. In the absence of quantitative targets for them to play with and stake claims to financial allocations for their pet projects and programmes, the Approach Paper was of no use to them.

When the NF government was toppled, Chandra Shekhar who was catapulted to the office of prime minister by Congress(I) put in place his own Planning Commission which, while it airily declared its support to the Approach Paper drawn up under the NF government, began energetically to play with figures and quantities, totally unmindful of the policy implications. Chandra Shekhar, on his part, anxious to score political points, went enthusiastically for scaling up the growth target of the plan. But when the planners sought some guidance from the prime minister on the resources position, they drew a blank. A three-man committee consisting of the prime minister, the finance minister and the deputy chairman of the Planning Commission was set up to determine the resources position. But nothing in this regard was done either by the committee or anyone else. If the planners still found themselves obliged to pursue the growth target of 6 per cent for the plan, this was only to humour the prime minister rather than to undertake a serious exercise in drawing up the plan. Meanwhile, the resources position rapidly worsened and no remedial action has been possible with even the budget for 1991-92 being withheld for narrow political considerations.

The very idea that the prime minister of the day should order the planners to work backwards from a given growth target set arbitrarily and calculate on that

meets of the plan is fantastic. This is what Rajiv Gandhi did for the Eighth Plan. Chandra Shekhar has followed him. The first imperative of sound planning, however, is a policy frame and political commitment on the basis of which to arrive at plan targets which are feasible and will achieve desirable results and objectives. The policy issues which have to be squarely faced today are of a wide-ranging and complex nature—the elitist resource mobilisation, including tax, policy, the determination of the space for big business and multinationals with their labour saving high technologies, mechanisation of farming, mocking at land reforms, inequitable sharing of the gains of production both in industry and agriculture, and so on. The minority government of Chandra Shekhar has been in no position to face the policy issues, it chose to avoid or obfuscate them.

The Chandra Shekhar government finally had no option but to put off the meeting of the National Development Council. It was singularly inept, even foolhardy, to propose the holding of the meeting in the given political conditions. For the deputy chairman of the Planning Commission, Mohan Dharia, a politician of some standing in the seventies, to be blissfully oblivious of the political imperative of serious and effective development planning was itself surprising. He went along with the idea and even came out in public in support of it. This only cast doubts on his competence and qualification to hold the office of the country's chief planner. The fact is that the Planning Commission assembled under the minority government of Chandra Shekhar could never get down seriously to the work of drawing up the Eighth Plan.

The plan making exercises were bound to become wholly infructuous once the presentation of the regular budget for 1991-92 was avoided in an abject submission to outside pressures and in order to subserve narrow political interests of the Congress(I). It was quite remarkable that the assembly elections in Tamil Nadu which were ordered after dismissing the elected government in the State on flimsy grounds was unabashedly given as the reason for postponing the presentation of the budget. This only emphasised that the government headed by Chandra Shekhar was too fragile to perform even the minimal tasks of governance. This was inherent in the political arrangement which had enabled Chandra Shekhar to achieve his ambition to occupy the office of prime minister without having to win a popular sanction in a functioning democracy. The lackadaisical ways of the

during its brief tenure.

After the proposed NDC meeting was called off, Dharia fondly hoped that the planners could justify their being in business in the Yojana Bhavan under the caretaker government by writing the draft of the Eighth Plan for presentation to the government which would be formed on the basis of the results of the general election. This too was, to say the least, a fanciful idea. The present Planning Commission has neither the political authority nor the policy direction to put together the draft of the Eighth Plan. There are doubts even about its professional competence. The planners would do well to avoid being pushed into an unenviable position by a group of self-serving politicians who while they lack democratic sanctions strut about in the corridors of power with tall populist pretensions. It is quite remarkable also that Mohan Dharia has not hesitated to faithfully follow his political friend and mentor, Chandra Shekhar, and talk about building the 'social infrastructure' such as provision of drinking water to all villages, all-weather roads, eradication of illiteracy, employment for millions and so on, and in the same breath call for the acceleration of the rate of growth in the Eighth Plan. What is being projected is a minimum of one percentage point above the rate of growth achieved in the Seventh Plan by sacrificing 'social infrastructure' to subserve the urgent needs of the mass of the people and a borrowing spree which has brought India close to the foreign and domestic debt trap. The planners if they are wise, should be more circumspect about scaling up plan targets when the plan implementation position is so tight and the political environment holds no assurance of a strict order of priorities and discipline, fiscal and organisational, which alone can make development planning meaningful and effective.

The Chandra Shekhar government also tries to look nonchalantly at the dark shadow of IMF which is hovering over economic policy and planning in India, even while it is actively seeking IMF benevolence and is going round with the begging bowl for foreign credits. To think that this is of no concern for plan-making is to show a shallow perception of the task of development planning, both in the short and medium term. The fact to be reckoned with is that the decks are being feverishly cleared for structural adjustment of the Indian economy to be financed by the IMF and other credits. This involves acceptance, together with foreign credits, of onerous conditions, the primary condition being that development planning has to be aborted and the role of the Indian state in the development

Planning Commission will still be retained is anybody's guess but it will certainly cease to be functional. It is also disconcerting in this context to find professionals in the Yojana Bhavan watching helplessly and falling in line behind small-time politicians. They may find some satisfaction in their work as technicians but, to be meaningful, their work has to have social content and direction, failing that their role and work are bound to be frustrating and even demeaning. The grand ideas of social transformation, decentralisation of the political and administrative structures, protection of labour-intensive productive activity, assurance of gainful employment for the unemployed and underemployed and a self-reliant growth process which does not rest on foreign crutches, which were projected in the Approach Document under the N F government have ceased to be even talking points currently in plan-making exercises. The extent of helplessness, dependence on foreign creditors, is indeed disconcerting. For the caretaker government to exonerate a Japanese firm black-listed for bribing Indians in order to get Japanese credits is revealing of the present state of affairs. It shows the depths, moral and political, which have been touched. Chandra Shekhar has probably exonerated the corruption in the Bofors transaction to sanctify this position. To get out of such a morass is not going to be easy. The talk of development planning is meaningless in these conditions.

Caste and Bihar Politics

Ravindra Kumar Verma

Though the backward castes constitute nearly 60 per cent of Bihar's electorate, till the early years of the 1970s these castes were politically not significant. 1977 was the turning point in their political organisation when reservation for backward castes in government service was introduced.

THE strength of the total electorate in Bihar was 3,49,30,842 in 1977 which rose to 3,97,13,485 in 1980, 4,33,31,010 in 1984 and nearly 5.40 crore in the 1989 parliamentary elections when the voting age was reduced to 18. Though the electorate may be classified on the basis of caste, religion, class etc, caste considerations are of prime importance. After 1977 when the Janata government introduced caste based reservations in Bihar three basic caste groups emerged—forward castes, backward castes and scheduled castes and scheduled tribes.

The forward castes consist of Brahmins, Bhumihars, Rajputs and Kayasthas. Land and other resources such as official position, literacy, better economic conditions and social respect have been the privilege of these castes which accounts for the political dominance of these castes. But now the situation has begun to change and these castes are being gradually eclipsed politically. However, they still retain a political significance disproportionate to their numerical strength.

The Kayasthas constitute only a small portion (1 per cent) of the total population of the State. Kayasthas acquired importance in Indian history since Moghal period because they learnt Urdu (and later English in the British period) faster than other castes and were attached to rulers for assistance in governance. This caste has been politically significant even prior to independence. Many national leaders during the freedom struggle such as Sachchidanand Sinha, Rajendra Prasad and Jai Prakash Narain belonged to this caste. Since independence Kayasthas have played a significant role in Bihar politics. K B Sahaya, Badrinath Verma, Mahamaya Prasad Sinha Vindeshwari Prasad Verma, Phulan Prasad Verma, Jagat Narain Lal, Shyam Nandan Sahaya, Baldeo Sahaya, Kamaldeo Narain, Anirudha Prasad and P N Sinha were among the prominent legislators who were active in party politics in Bihar between 1946 and 1967. There has, however, been a sharp decline of role of this caste in Bihar politics particularly since the 1972 assembly elections.

It is a notable fact that in almost all the urban areas in Bihar Kayasthas are numerically significant. The Patna Lok Sabha constituency alone has nearly 1.5 lakh Kayastha voters amounting to nearly

15 per cent of the electorate. Two of the assembly segments Patna Central and Patna West have 46,000 and 93,000 Kayastha voters respectively. The Chitragupta Mahasabha, was a significant political force in Ranchi during the 1989 Lok Sabha polls. The Kayastha voters are very important in the Patna Lok Sabha constituency. Former General S K Sinha, among the prominent contestants from Patna in 1984 general elections, polled over 1.17 lakh votes. Shailendra Nath Srivastava (BJP) won the Patna seat in the 1989 elections by a margin of 21,593 votes defeating sitting Congress(I) MP, C P Thakur. Other prominent Kayastha leaders are Subodh Kant Sahay (Union minister of state) and Dharmesh Prasad Verma who won in 1989 Lok Sabha elections. However, when Bihar as a whole is considered the Kayasthas are being marginalised in Bihar politics. For this reason all but the highly political Kayastha voters may go to the BJP.

The reason that the Kayasthas are being marginalised in Bihar politics is on account of the close nexus between violence and politics. Being numerically insignificant this caste is unable to handle or use muscle power or organise a private militia. The other factor that is making it politically defunct is that the majority of this caste is service oriented and is hence politically unorganised. Bihar's politics has altered substantially since the first two decades of independence and in this changed situation the Kayasthas are not competitive. Nevertheless, this caste constitutes 5.5 per cent of the representatives from Bihar in the ninth Lok Sabha.

Brahmins constitute nearly 7 per cent of Bihar's total population. The Brahmins of Bihar are categorised, in terms of politics, into two major groups—the Maithils and non-Maithils (Kankubja, Sarjupari etc). The Maithils generally come from the northern districts like Darbhanga, Madhubani, Sitamarhi, Muzaffarpur, Bhagalpur, Saharsa, Purnea, Munger and Begusarai while the non Maithils reside in other parts of the State and are generally concentrated in middle Bihar.

Although some important Brahmin leaders (of the latter category) like Kedar Pandey, Ramanand Tewary, Jagnarain Trivedi, Bindeshwari Dubey, K K Tewari

and Lal Muni Choube emerged in politics they could not ensure Brahminical dominance of Bihar level politics. They could only remain confined to scattered Brahmin pockets. The political role of this caste in Bihar is visible since the 1960s.

The Maithil Brahmins came to the forefront in 1961 when Binodanand Jha became the chief minister and continued till 1963. With his coming to power Brahmins acquired a sense of unity but Brahminical unity was short lived. Maithil power reemerged in the early 70s with the rise of Lalit Narain Mishra who established his political significance under the leadership of Indira Gandhi. However, the most important mass political leader who emerged in 1975 as chief minister was Jagannath Mishra. When he assumed power in the State the Maithil Brahmins acquired important positions in the political system. Harinath Mishra, Radha Nandan Jha, Nagendra Jha, Bhagwat Jha Azad became part of the centre of power in the State. With the death of the veteran Socialist leader Karpoori Thakur, Raghunath Jha from the non-Congress platform emerged as a likely chief ministerial candidate. However, Jha has been unable to retain the chieftainship of the Bihar Janata Dal.

Though the Brahmins form an important part of the bureaucracy, judiciary and political life in the State there has been a polarisation of this caste, into Maithils and non-Maithils. Nevertheless, of representatives from Bihar in the ninth Lok Sabha 5.5 per cent are from this caste. Although the Brahmins are supposed to be affiliated to Congress Party the three Lok Sabha MPs elected in 1989 Raj Mangal Mishra (Gopalganj), Janardan Tewari (Siwan) and Bhogendra Jha (Madhubani) belong to three different political parties Janata Dal, Bharatiya Janata Party and Communist Party of India respectively.

Among the upper castes the Bhumihars have considerable landed property. Important among the leaders of the caste were Ganesh Dutta, Shri Krishna Sinha, and Ram Dayalu Singh. From 1937 to 1939 Shri Krishna Sinha was prime minister of Bihar and again from 1947 to January 1961 he was the chief minister of Bihar. During his chieftainship, many new leaders emerged from this community. Important among them were Mahesh Prasad Sinha, Krishnakant Sinha, L P Shahi, Ram Briksha Brahmachari, Basawan Sinha, Shyam Nandan Mishra, Ramashray Prasad Singh, Kailashpathi Mishra and others. This caste has also provided some women leaders like Krishna Shahi, Tarkeshwari Sinha and Usha Sinha.

Shri Krishna Sinha remained in power for a considerable period in Bihar which generated the resentment of other com-

murdered against this caste. After the death of Shri Krishna Sinha the Bhumihars could not retain their hold on Bihar politics to the same extent. However, in the Congress Ramashraya Prasad Singh and L P Shahi and in the BJP Kailash-pathi Mishra are considered pillars of their parties. After the debacle of Congress in the 1989 general elections, the caste's political hold has declined. In the 1989 Lok Sabha elections the caste bagged three seats which is in the forefront of the anti-Mandal struggle.

The Rajputs have also been a land owning community active in Bihar politics. Anugrah Narain Sinha was active in the Congress and was for years regarded as a lieutenant of Rajendra Prasad. Anugrah Narain Sinha was Shri Krishna Sinha's rival for official leadership. 1957 witnessed struggle between Shri Krishna Sinha and Anugrah Narain Sinha for leadership of the Congress legislature party. That struggle intensified caste-struggle in the state. Before that contest, caste rivalry at the political level was conducted in less visible ways. Now the struggle assumed a vocal and externally visible proportions. Other important leaders of the caste have been Nand Kumar Singh, S N Sinha, P N Singh, Deep Narain and Ambika Sharan Singh.

In the 1980s the prominent Rajput leaders who emerged as significant leaders were Suraj Narain Singh, Chandra Shekhar Singh, Ram Dulari Sinha, Bhishma Narain Singh, Kishori Sinha and Manorama Singh. In 1988 the Congress party in the State had to face the problem of dissident groups. As a result the Congress central leadership imposed Sateyan-dra Narain Sinha the son of late A N Sinha, as chief minister in order to defuse tension but his defeat in 1989 affected Rajput's hold on Bihar politics. The caste bagged six seats in 1989 Lok Sabha elections.

BACKWARD CASTES

The backward castes constitute nearly 60 per cent of the total voters in Bihar.

In the early part of 1970s, these castes were politically not significant. In the late 1930s a Triveni Sangh was formed consisting of Yadavas, Kurmies and Koeries—the three landed castes among the backward castes. The politically significant backward castes are Yadavas, Kurmies, Koeries, Baniyas, Kahars, Dhanuks, Nonias, Telis, Suris, Kanus, Lohars, Bindis, Hajam, etc, among which Yadavas, Kurmies and Koeries are the frontline. Although Karpuri Thakur was a Hajam (barber) he represented the whole backward caste community.

The turning point in the organisation of these castes was in 1977 when Karpuri Thakur, the then chief minister introduced reservations for backward castes in government service. The forward castes reacted vigorously against this decision as a consequence of which the process of backward caste solidarity gained momentum. Since then politics in Bihar has been characterised by a fourfold division—forward castes, backward castes, Harijan and regional (tribal) politics.

The Congress Party relies on the forward castes in the State as seen by the fact that the Congress(I) in 1989 Lok Sabha elections, awarded more than 70 per cent of its tickets to forward castes for the general seats. The Janata Dal awarded more than 80 per cent of its tickets to non-forward castes at the behest of Laloo Prasad Yadav. The distribution of Lok Sabha tickets by different political parties suggests that the Yadavas, Koeries, Kurmis and Baniyas enjoy considerable political influence in the State due to their numerical strength and growing militancy.

It is clear that Yadavas are the political elite among the backward castes. Ram Lakhani Singh Yadav emerged as caste leader in 1960s under the patronage of chief minister K B Sahay and until recently was considered the sole Yadav leader. The other Yadav leaders like B P Mandal and Daroga Prasad Rai were not recognised as caste leaders at the State level. After the death of K B Sahaya and the phenomenal rise of Brahmins in Bihar politics,

Ram Lakhani Singh Yadav although he did not lose the leadership of his caste gradually lost his state level political significance. The emergence of backward caste politics led by Karpuri Thakur also weakened his hold in the political arena. Due to the vacuum in backward caste politics in Bihar created by the death of Karpuri Thakur, some new faces emerged. Important among them are Laloo Prasad Yadav, Nitish Kumar and Jai Prakash Yadav.

It is important to note that the Yadavs have cornered the largest number of seats won by any single caste—Laloo Prasad Yadav (Chapra), Hukumdeo Narain Yadav (Sitamarhi), Devendra Prasad Yadav (Jhanjharpur), R K Yadav (Madhepura), Chunchun Yadav (Bhagalpur), Ramsharan Yadav (Khagaria), Surya Narain Yadav (Saharsa), all from the Janata Dal, Janardan Yadav (Godda) of BJP and Ramashray Prasad Singh (Jehanabad) and Tej Narain Yadav (Buxar) of Communist Party of India. The CPI allotted four tickets to Yadavs while the BJP and IPF allotted three each. Besides the nine seats won by Yadavas eight yadavs finished second. This caste has thus emerged politically as the strongest single caste.

During 1989 Lok Sabha election, backward castes other than Yadavs bagged 17 seats which is 31 per cent of the total seats. If we add the number of Yadavs, the percentage of seats won, is over 48 per cent.

SCHEDULED CASTES

The scheduled castes in Bihar according to the 1981 census constitute 14.45 per cent of the total population. In terms of growth, we find that the population ratio has been increasing from one census to the next. The percentage of scheduled caste in Bihar in 1951 was 12.67, 14.07 in 1961, 14.11 in 1971 and 14.45 in 1981. The numerical strength of the scheduled castes is 101.42 lakh. Districtwise their population percentage ranges from 9.8 per cent to 24.4 per cent. Palamau district has the

TABLE: CASTES AND PARTIES IN IX LOK SABHA ELECTION

| Castes | Political Parties | | | | | | Total |
|---------------------------------------|-------------------|------------|------------|------------|------------|-----------------------|-------------|
| | JD | BJP | Congress | CPI | JMM | Others | |
| Brahmin | 1 (3.3) | 1 (11.1) | — | 1 (25.0) | — | — | 3 (5.5) |
| Bhumihar | 2 (6.5) | 2 (22.3) | — | — | — | — | 4 (7.2) |
| Rajput | 6 (19.3) | — | — | — | — | — | 6 (11.1) |
| Kayastha | 2 (6.5) | 1 (11.1) | — | — | — | — | 3 (5.5) |
| Yadav | 7 (22.5) | 1 (11.1) | — | 2 (50.0) | — | — | 10 (18.6) |
| OBC (Koeri, Kurmi, Vaisya and others) | 5 (16.1) | 2 (22.2) | 1 (25.0) | 1 (25.0) | 1 (33.3) | 2 (66.7) IPF + MCC | 12 (22.3) |
| Muslims | 2 (6.5) | — | 1 (25.0) | — | — | — | 3 (5.5) |
| SC | 6 (19.3) | 1 (11.1) | — | — | — | 1 (33.3) CPM | 8 (15.0) |
| Pasi, Dusadh, Dhobi | — | 1 (11.1) | 2 (50.0) | — | 2 (66.7) | — | 5 (9.3) |
| ST | — | 1 (11.1) | 2 (50.0) | — | 2 (66.7) | — | 5 (9.3) |
| Total | 31 (100.00) | 1 (100.00) | 4 (100.00) | 4 (100.00) | 3 (100.00) | 3 (100.00) | 54 (100.00) |

Note : Figures in brackets show the percentage.

of 4,78,225. The districts with sparse scheduled caste population are Singbhum, Ranchi, Santhal Pargana and Bhagalpur.

The major constituents of the scheduled castes are Chamar, Dusadh, Dhobi, Dom, Pasi and Musahar. Although there are 23 castes under this category the most conspicuous in numerical terms are the above five castes (71 per cent). The political consciousness of the scheduled castes have no doubt been increasing since the introduction of general elections. If we take the number of contestants from these castes in the Lok Sabha election we find that there has been a phenomenal rise. The scheduled caste contestants numbered 35 in 1967, 52 in 1971, 40 in 1977, 56 in 1980, 66 in 1984 and 70 in 1989. Interestingly, none of the national parties have so far fielded scheduled caste candidates from the 41 general seats in the State in the last 40 years.

The important scheduled caste leaders from Bihar are Ram Bilas Paswan, Meera Kumar, Mahabir Paswan, Dumar Lal Beitha and others. Jagjivan Ram was the first scheduled caste leader from Bihar, who emerged at the national level. In the 1989 Lok Sabha general elections the national parties such as Janata Dal, BJP, Congress(I), CPI, etc, fielded candidates belonging to the Pasi, Dhobi, Dusadh and Chamar castes. The Congress(I) fielded eight candidates, Janata Dal six, Bharatiya Janata Party three and CPI and CPI(M) from one each.

Mahendra Baitha (Bagaha), Ram Bilash Paswan (Hajipur), Dasai Choudhary (Rosera), Sukhdeo Paswan (Araria), Chhedi Paswan (Sasaram) and Jorawar Ram (Palamau) belong to the Janata Dal. Prem Pradeep (Nawada) and Ishwari Choudhary (Gaya) belong to the CPI(M) and Bharatiya Janata Party respectively. Prominent losers among scheduled castes contestants, contesting on the Congress(I) ticket, were Mahavir Paswan (Hajipur), Ram Bhagat Paswan (Rosera), B L Baitha (Araria), Meera Kumar (Sasaram), Kuer Ram (Nawada), Ram Swaroop Ram (Gaya) and Kamala Kumari (Palamau). The BJP's scheduled caste candidates who lost were Kameshwar Paswan (Nawada) Ramdeo Ram (Palamau) and the only CPI loser was Janaki Paswan (Gaya). The losers also belonged to Dhobi, Chamar, Pasi and Dusadh castes.

SCHEDULED TRIBES

The scheduled tribe population in Bihar numbers 58,10,867 according to 1981 census which constitutes 8.3 per cent of the total population. The highest concentration of scheduled tribes are in the districts of Ranchi (54.4 per cent), Singbhum (44.1 per cent) and Santhal Pargana (36.5 per cent). The districts of

sizeable strength, amounting to 18.3 per cent, 13 per cent and 11.4 per cent respectively.

The important tribes in Bihar are Mundas, Oraons, Ho, Bhumij, Kharia, Paharia, Thhana, etc. To these are added Santhals who reside mainly in Santhal Parganas administratively controlled by the districts of Bhagalpur, Santhal Pargana, Deoghar, etc. Exclusion of a large part of the tribal population from the benefits of economic and social progress and the marginalisation of their culture has led to the demand for a separate State. The Jharkhand movement was started in the 1950s and since then has had fluctuating fortunes. Up to 1969 the most influential leader was Jaipal Singh who formed the Adivasi Mahasabha in 1946 and later the Jharkhand Party in 1950s which merged with the Congress Party before the 1967 elections. Soon every tribal, organisation bore the name 'Jharkhand', such as All India Jharkhand Party, Hul Jharkhand Party, Bihar Prant Hul Jharkhand and so on. Of all the Jharkhand parties the most forceful, is Jharkhand Mukti Morcha born towards the end of 1972.

In the 1967 Lok Sabha elections the total number of contestants from tribal constituencies was 32—of which the Congress fielded five, Swatantra Party three, Bharatiya Jana Sangh five, SSP one, CPI one and PSP one, the remaining 16 being

by the 1971 parliamentary elections of which the Congress(R) fielded three, Bharatiya Jana Sangh one, PSP one, CPI one, Jharkhand Party combine nine and independents 22. The picture in 1977 was different judged by the fact that there were only 28 contestants out of whom 18 were independents. In 1980 there were 51 contestants from the Jharkhand area compared to 55 in 1984.

There were six constituencies reserved for scheduled tribes in Bihar in 1952 but from 1957 and onwards this went down to five namely, Rajmahal, Dumka, Singbhum, Khunti, and Lohardagga. In the 1989 Lok Sabha elections the Jharkhand Mukti Morcha and Congress won two seats each and the BJP one. Simon Marandi from Rajmahal, Shibu Soren from Dumka were JMM candidates. Bagun Sumburi from Singbhum and Sumati Oraon from Lohardagga were from the Congress(I). Karia Munda from Khunti belongs to the BJP. The important Jharkhand candidates who lost in 1989 were Krishna Marandi and N E Horo.

The Jharkhand Mukti Morcha fought from non-reserved constituencies also out of which one seat—Jamshedpur—was won by JMM candidate, Shailendra Mahto. The other notable fact is that the BJP has shown great interest in tribal politics and was able to bag one reserved seat on the slogan of a separate 'Vandanchal' State.

DEVELOPMENT AND UNDERDEVELOPMENT

The History, Economics and Politics of North-South Relations

HARTMUT EISENHANS

Two major theoretical perspectives traditionally govern any discussion of the entire gamut of North-South relations. Although differing in their practical implications, both are very similar in terms of their basic theoretical framework, namely Development is the result of the accumulation of capital financed, in the first case, through state mobilisation of local savings and control of external economic relations, and, in the second, through the pull of exports and the inflow of export earnings.

In this provocative book, Hartmut Elsenhans discusses the shortcomings of both perspectives and analyses the complex political and economic relations between the advanced industrial countries of the North and the developing countries of the South. He establishes the link between mass consumption and development, and criticises the world-system perspective developed by some Marxist writers. The author goes on to demonstrate how the unequal specialisation and deformation of the economies of the South resulted in a specific class structure and mode of production dominated by state-classes. It will be valuable reading for students and others interested in the economics and history of North-South relations, development economics and international relations.

Reform of Financial System

Press reports on the report of the World Bank staff team on India's financial system have tended to be sensational. True, the report favours eventual privatisation of the financial system. But that is not the central theme. Greater efficiency and flexibility are the keys to reform and privatisation is seen as a means to promote them "in the long run".

I
LAST year a World Bank staff team prepared a report on the Financial System of India which has surfaced in press reports and comments in the context of specific project loans under negotiation with the World Bank and drawings made/expected to be made by India on the IMF. And yet the status of the report has not been clarified. It appears to be no more than a technical survey of the financial sector and although it contains a number of recommendations, these have not, as far as one can judge, been presented to the government as a package of reform as a condition for future funding. The staff report would of course guide the thinking of policy makers in the World Bank as well as in India. It thus provides a framework for a policy dialogue. The specific policy recommendations of the report and the time frame for them, one surmises, are not to be construed as definitive views of the World Bank but only as indicative of the technical level thinking of the Bank staff. If this is so, there is considerable merit in generating a public dialogue on the subject, since the issues raised by the report are of considerable importance to the future development of the financial system and indeed for the planning process.

The issues are not new. They have been raised time and again. The Chakravarty Committee went into many of them and on quite a few the approach of that committee, surprising as it may sound, was not far different from that of the Bank staff report.

Press reports on the Bank staff report (BSR) have tended to be sensational. True, the BSR favours an eventual privatisation of the financial system. But this is not the central theme. Greater efficiency and flexibility are the keys to reform and privatisation is seen as a means to promote them "in the long run". The BSR has a three-stage plan of reform: the immediate, the mid-term and the long-term. The plan follows from its analysis of the deficiencies of the financial system.

BSR, while appreciating the enormous progress made by the financial system (i.e. banks and financial institutions

which include investment institutions) in the past two decades in mobilising resources and increasing the share of financial savings in the total, is critical of the system's ability to allocate savings 'efficiently' among different uses. BSR takes a macro-view of the system since the large bulk of the commercial banks' resources are diverted to the government through the statutory liquidity ratio, and of the balance, a good portion goes into "directed" lending (priority sectors, food credit, etc). It is presumed that government does not use the resources acquired by it wisely or efficiently, thus the system as a whole is inefficient. It is also not flexible because the Reserve Bank administers a complex structure of the rates of interest and requires approvals by it of every financial innovation which a bank or a financial institution may dream up. Politicisation of the system has caused its portfolio to deteriorate. Clearly a wide-ranging reform is overdue.

Thus far, there can be little dispute with the BSR. The Chakravarty Committee (CR) for instance stated:

The administered interest rate system has grown to be unduly complex and contains features which have reduced the ability of the system to promote the effective use of credit.

The yields on Treasury Bills and government securities are at levels which have led to a considerable monetisation of public debt leading to high levels of monetary expansion.

The captive market for government securities, and the relatively low return to banks on their holdings to government securities have adversely affected the growth of the capital market on the one hand and profitability of banks on the other.

Concessional rates of interest appear to have allowed projects of doubtful viability to be undertaken.

The policy of insulating banks from price competition and confining competition to customer service has not served to promote high standards of customer service.

Quantitative credit controls have come under severe stress in the absence of support from any price rationing mechanism.

The administered interest rate system has been found to be lacking the flexibility necessary for augmenting the pool of financial savings by effecting suitable changes in the deposit rates from time to time as the low profitability of banks mentioned earlier has

made banks wary of increasing the average cost of deposits.

The committee went on to say that any "modification of the system of administered interest rates" should aim at eliminating to a substantial extent, if not fully, the above mentioned deficiencies.

While there is a similarity of diagnosis between BSR and CR, prescriptions differ. BSR would, expectedly, rely primarily on price mechanism and want interest rates to be "market-determined" in the long term. CR states:

The reliance on the price mechanism should be in addition to, and not a substitute for, quantitative controls on credit flowing from plan priorities and the compulsions of demand management.

The differences become sharper on the continuance of priority sector lending and ownership of banks and financial institutions. But all that is in the BSR's long-term. When it comes to immediate steps, there is a greater similarity of approach.

The immediate steps which BSR recommends are: (i) reduction of budget deficit, (ii) progressive decline in CRR and SLR to a level of 30 per cent in three years, (iii) removal of large borrowers from priority sector and thus reduction of the target of priority sector lending to 10 per cent and further to 10 per cent in three years, (iv) liberalisation of some of the interest rates, e.g. long-term lending rate of IDBI, etc., debenture issues, export loans, housing, and (v) acceptance of the recommendation of the Khuro Committee to group agricultural lending rates into two tiers, a low rate, which is still a little higher than the cost of deposit mobilisation, for the truncated priority sector and the general rate for the rest.

CR also cavils at large-scale deficit financing by the government. For instance, it states:

The increased recourse to deficit financing is a disconcerting development and it is necessary to ensure that deficit financing, measured in terms of recourse to credit from the Reserve Bank, does not exceed safe limits.

CR's views on flexibility of interest rate structure have already been noted. Even on priority sector lending, CR is concerned about the large scale overdues. It states:

The Reserve Bank of India may consider ways and means including legal enactments in consultation with the government of India, of providing the necessary powers to recover dues expeditiously to the lending agencies concerned, be they banks, or other specialised lending agencies which may be set up over the years for the purpose.

This, before loan melas and subsequently loan waivers got going!

The comparison between BSR and CR is not intended to play down major differences of approach between the two,

particularly in respect of the role of monetary policy in the context of planning. The objective rather is to draw attention to the common ground that exists and which can be a non-controversial starting point for the reform. At some stage, however, policy-makers have to bite the bullet and make a choice between the continuance of a highly politicised financial system—'politicised' in the sense of sub-serving not plan objectives, but the whims and fancies of individual politicians—and one which, because it is market-oriented, has a greater chance of being impersonal.

The BSR advocates that in the *mid-term* (i) priority sector lending should be eliminated altogether, (ii) floating interest rates be introduced, (iii) the capital base of commercial banks be strengthened, "perhaps through private sector participation" (emphasis added), and (iv) private sector participation be allowed in IDBI and IFC and increased in ICICI.

In the *long-term* the BSR would privatise the banks, financial institutions and money and capital market and let interest rates be determined by market forces.

II

How should the authorities react to the BSR? It is clearly not sufficient to say that privatisation of the financial system and making it fully market-based will not be politically acceptable in India. It is necessary to consider whether a different approach on ownership is not consistent with the crucial measures of reform. And the pace at which these can be implemented should be the major theme of the authorities' dialogue with the Bank staff.

It must be admitted that the rot in the system began with the banking system. The public sector banks have been greatly weakened over the years, because of the assumption by the government that the deposit resources of the banks belong to the state, ignoring the simple fact that they belong to the depositors. Banks must act primarily in the interest of depositors—i.e., maintain strong viability of their portfolios and augment their capital base through surplus generation rather than doles from the government. They have not been able to do so because of the excessive zeal shown by some of them to pander to the whims of politicians. The government can legitimately ask the banks to divert a reasonable part of their loans to priority sectors. But the government commandeers 53 per cent of deposits through cash and statutory liquidity ratios at less than market related interest rates and further requires 40 per cent of the balance to be advanced to priority sectors, again at low rates of interest. The banks are thus not able to earn an adequate surplus on the

balance of funds which can be advanced at commercial rates of interest. Even this was controlled until recently through a ceiling on interest rates. Fortunately, it has been removed. The return on assets of banks, BSR points out, has averaged about 0.15 per cent over the past five years, which is among the lowest in Asia.

The weakness of the banks' portfolios does not arise from the requirement of priority sector lending *per se*. It is the manner in which it is implemented—through direct political intervention which erodes the sanctity of a loan and generates total callousness about repayment, which is evident far more in the medium and large industrial sector which accounts for a considerable proportion of sick units.

For the banks, then, the priority in reform has to be restoration of their financial strength, in the face of growing threat from financial disintermediation. This means an increase in their average spreads, enlargement of their capital base. These objectives are capable of being achieved without de-nationalisation. A rationalisation of the priority sector lending programme is feasible. Several studies have shown that access to credit is far more important in rural areas than its cost. Were it not so, the rural moneylenders who charge inordinately high rates of interest would not have survived. Thus concessional lending rates can be raised without detriment to the flow of credit to the poor borrowers. BSR calculates that the interest rate subsidy on priority sector lending amounts to some 6.6 per cent of bank *earnings*, equivalent to about 0.5 per cent of assets. This is not as much as the cost of subsidising government on the "directed investments". Nevertheless mindless subsidisation of the relatively well-to-do farmers and small industrialists cannot be justified.

As for the capital base, the practice so far has been to provide increases in capital by budgetary subventions as bank profits have been far from adequate. Even so their capital and reserves average only 1.5 per cent of their assets as compared, for instance, with 4 per cent in Pakistan and 6 per cent in Thailand. It will take quite some time for the banks to earn enough surplus to improve their capital base. A realignment of interest rates is clearly called for. Average spreads (which are about 3 per cent now and almost equal the bank costs leaving meagre profitability) will not increase with the latest increase in the minimum lending rate from 16 per cent to 17 per cent. But an increase in the return on government securities (or a reduction in SLR) will help. Given the need to control the budget deficit (interest payments eat up a good percentage of the government's revenue), it is not easy to

contemplate a further increase in interest rates on government securities. Indeed, there is a respectable body of opinion in the country that the progressive increase in such rates which has occurred over the past decade is perhaps not called for. The dilemma is genuine. But it is necessary to take the bull by the horns. The SLR has to be reduced to improve the health of the banking system. The reduction will also impel the government to correct the fiscal imbalances. BSR cites a calculation that a budgetary deficit of 4 per cent of GDP and CRR plus SLR of 30 per cent are consistent with market-related interest rates on government securities. Clearly, one has to move all the three variables—starting with fiscal discipline. The message is clear. Banks cannot become healthier if the fiscal balance remains precarious.

Measures of cost reduction are also important. BSR cites some telling figures: India has about 40 per cent more bank employees per million dollars of assets than Pakistan and nearly 300 per cent more than Indonesia. One of the least desirable consequences of nationalisation was the boost it gave (one is inclined to believe, for political reasons) to the aggressive unionism in banks. Government has on most occasions succumbed to the extreme demands of the unions which has not merely raised personnel costs but also impaired staff discipline. Poor customer service is the inevitable consequence.

BSR recommends greater autonomy for banks. Part of the problem is the banks themselves. How many of them refuse to comply with improper demands made on them? Autonomy is never granted. It has to be wrested by upright and courageous professionals. Some bold measures are necessary, e.g., delegating the appointment of chief executives of banks to the Reserve Bank of India. BSR recommends some degree of privatisation of commercial banks. It is doubtful, however, if ownership is such a crucial issue in generating better performance. Perhaps easier entry for new private banks will have a greater impact through competition.

BSR makes a somewhat far-reaching—and questionable—recommendation regarding the relative roles of commercial banks and financial institutions. In project financing and rehabilitation of sick units, term lending and working capital have to go together. Numerous committees have gone into the question of co-ordination of these activities. BSR's approach is to hand over the term-lending function to the commercial banks, leaving financial institutions with some of the other financial services: underwriting, bridge finance, leasing and equipment finance, venture capital, credit rating, training in project appraisal, etc. This is

visualised as a long-term demarcation of functions. Although term financing by banks and directly from the capital market has been growing, would a historically British-oriented banking system be able to move over to a wholly integrated German-style functioning? Will it have the skills and resources? Instead of a water-tight demarcation of functions, what seems to be practicable is definition of fairly high minimum levels of term lending for financial institutions, thus increasing the scope for banks without banishing the financial institutions altogether from what has been their main business.

On capital markets, BSR, predictably, recommends decontrolling share issue prices, removing the cap on interest rates on debentures and giving a greater role to SEBI in enforcing standards in the stock markets. It wants the Unit Trust's "market dominance" to be reduced by elimination of the tax preference it enjoys and allowing private sector entry into the mutual fund business. There is clearly a need for new thinking on these matters. Fixation of premia on new issues of shares by the government has not been found satisfactory in many instances. When these are fixed too low, unofficial premia emerge to the detriment of the shareholder and the company, resulting only in the enrichment of the middlemen. The stock markets are too narrow and this is the main reason why investment institutions like UTI appear to be 'dominant'. The so-called 'tax preference' in favour of UTI is no longer an act of fiscal volition by the government, but a consequence of the legal status of the UTI as a 'domestic company'. It is arguable that the 'tax preference' has had the unintended consequence of affecting the structure of UTI's business. Entry by public sector banks into mutual fund business has been allowed and their income is also tax-free. Much more needs to be done by way of establishing prudential norms before private funds can become a reality. But a general point of the BSR is worth noting. Caps on interest rates along with numerous *ad hoc* tax concessions in the financial sector tend to disturb the pattern of interest rates and make it far more complex than is necessary. Decisions on the concessions on public sector bonds or national savings schemes are often taken without considering their overall monetary impact.

What would be the general level of interest rates in India, if they were to be determined by market forces? Some guidance is available from the bazaar rates which range from 2 to 3 per cent a month. Even if rates do not reach such levels, they may move up considerably. There is a view

that this will hurt industrial investment. But if the inverted pattern—short rates being higher than longer ones—gets corrected through a reduction in inflationary expectations, there is no reason why

interest rates would move up a great deal. The villain of the piece is inflation. Its control, and this means control over fiscal deficit, is at the heart of financial sector reform.

Information Game: Lesson from Gulf War

Dipankar Sinha

Why did the US resort to censorship on news coverage from the Gulf during the war and carry out a disinformation campaign? Recourse to such practices might have suited Saddam Hussein a dictator fighting a lost battle, but not George Bush especially when his victory was never in doubt.

IN the recently concluded Gulf war it is information which lost to both George Bush and Saddam Hussein. Both sides tried their best to play the information game. The rules were the same: a strict restriction on information flow, on the one hand, and dissemination of exaggerated claims about their destructive capabilities. The US-led Western states not only won the war but also the game by their sheer monopoly over information. The world was flooded with US-controlled or US-supported Western news agency reports on the war including one on how the 'international thug' Saddam Hussein's 'beastly soldiers' were carrying out 'fiendish sex attacks' on women hostages after invading Kuwait. Pentagon circulated video images of bombs destroying 'only' the military targets in Iraq were extensively shown, but little was known about the sufferings of the innocent Iraqi civilians who were heavily bombarded by the multinational force which went beyond the limit set by the Resolution 678 of the UN Security Council.

Discussion on the Gulf war concentrates on issues such as its rationale, its hi-tech nature, the motives of the participants, the strategies adopted, Iraq's defence capabilities, anti-war protests and its impact—political, economic and ecological. Compared to these, discussion on the informational aspects of the war is limited. But a post-mortem analysis should mention that the information game played during the war has opened up a more general and profound question: information vital to all the member states of the world still has its concentration and control mechanism safely placed in the advanced industrialised countries of the West, especially the US, and that the developing states, the helpless recipients of information, are yet to achieve a breakthrough in 'information politics'—the battle for power over facts. While the

West is tightening its control on the international information structure, the developing states are gearing themselves towards a greater adherence to the prevalent order instead of continuing with the demand for its transformation.

INFORMATION AS POWER

Trends in the international arena, especially during the last two decades, make it clear that information has become a major component of power in interaction among states. It has become "an essential element in knowledge of all problems which determine or affect the lives of peoples and the evolution of societies as well as relations among nations. It constitutes a key-element in decision-making..."¹ In a complex and rapidly changing world the capacity to exploit (to use the term in a non-pejorative sense) is pivotal in taking any step or action. The developing states clamouring for a better world order which, they believe, would provide them with a better bargaining position and from a larger perspective, equality of opportunity *vis-a-vis* their developed counterparts, is not unexpected. The developing states stand at a lower pedestal not only because of their lower economic strength but also because of their backwardness in 'knowledge industries' (knowledge industries has information processing, education and research and development as its main components). In the colonial days colonial states could retain monopoly over information without any resistance from the hopelessly dependent colonies. But with the radical transformation of the political map of the world as a result of liberation of erstwhile colonised states, access to information became a 'right' to be enjoyed by all the sovereign states. The primary reason for providing information so much importance was that lack of it and of effective means of using and exchanging it

were widely regarded as a 'hurdle' to economic and social development. But the very demand for the 'right' has made the states enjoying monopoly over information all the more cautious. And to some of them, offence seems to be 'the best defence. Otherwise, why should the US resort to censorship on news coverage from the Gulf and disinformation campaign. It might have suited Saddam Hussein, a dictator fighting a lost battle, but not George Bush, especially when his victory was never really in doubt.

The answer lies in information, both quantitative and qualitative. It is a vital input perpetuating the transnational power-structure, both political and economic, which serves the interests of the West. From the political perspective, while the very dream of establishing control by naked aggression against other states—the classic form of colonialism—is an absurdity now, political domination is sought to be expanded and maintained, perhaps more efficiently than ever before, by 'ideological warfare'. The technique, to put it simply, is to exercise total control over the sources of information in order to impose political ideas and values, thus, stifling the growth of indigenous ones. This not only undermines the confidence of the developing states, which grows out of their political independence, but also moulds the consciousness and perception of the inhabitants in these states.

The West-centric 'information explosion' with its sheer volume and frequency is not confined to establishing the 'right to inform' politically. It also stretches with equal aggression to economic areas as well. Modern information system as a mechanism of development is as important as natural resources. Some scholars like Daniel Bell have gone to the extent of according it a greater priority as a critical indicator of economic power than the traditionally important raw materials and heavy industries. Information facilitates the capacity of the developing states to better their position *vis-a-vis* international finance, technology, transportation, food security, commodity negotiation, agricultural and industrial production and commercial intelligence, to name a few. It is also indispensable to deal with natural calamities, a frequent 'visitor' to the developing states.

So, information for understanding events in their proper political, economic and social contexts is an inescapable need. It is only natural that the developed states try to retain the chasm that puts them in a far superior position in information gathering, processing and user-capacity. But our view is that it is precisely this linkage of the present information structure and national interest which should

lead to a decisive and sustained demand for transformation of the prevalent structure.

THIRD WORLD'S RETREAT

Although the term 'free flow of information' is current since the second world war, the imbalance in the earth's informationosphere had become a major focus of international meets in the 70s. Information imperialism became a familiar term in the international lexicon when Urho Kekkonen, the former president of Finland, coined it in 1973. The non-aligned states began spearheading the movement against 'the information dictatorship of the First World' since the early 70s to establish a New International Information Order. The initial enthusiasm led to the adoption of action programmes, political declarations, establishment of co-ordinating committees and News Agencies Pool. The 4th General Conference of the non-aligned states in Algiers (1973) adopted action programmes by which TANJUG, the telegraph agency of Yugoslavia, assumed the responsibility of distributing information received from among the non-aligned states. In 1975 in Tunisia some practical proposals were discussed in a symposium. One was on the establishment of regional centres for production and distribution of information. It was also in Tunis that the term 'new international information order' was used for the first time. In 1976, in Colombo where the 5th Summit Conference of the non-aligned states was held, it was stated that a new order in the fields of information and mass communication was as vital as the new international economic order (NIEO). In the same year in New Delhi

an international conference of the information ministers of the non-aligned states deliberated on the status of the Non-aligned News Agencies Pool and came out with a document—The Declaration of the New Delhi Ministerial Conference of Non-Aligned Countries—and a resolution Action Plan for Co-operation in the Field of Information and Mass Media. The 6th Summit in Havana (1979) 'appreciated and hailed' the resolutions adopted in the 33rd Session of the UN General Assembly and commended the positive role of the UNESCO on the Information Question. The UN, especially the UNESCO, also joined the efforts. The 20th session of the general conference of the UNESCO in 1979 probed into the volume of 'one way information flow' and looked for measures to bring a change. Article I of the UNESCO Declaration mentions: "The strengthening of peace and international understanding, the promotion of human rights and the countering of racialism, apartheid and incitement to war demand a free flow and a wider and better balance and dissemination of information." The demand for an equitable information order continued in the 80s. The 37th session of the UN General Assembly noted that it was 'conscious of the need for all to collaborate' in the establishment of a new world information order based on the free circulation and wider and better balanced dissemination of information, guaranteeing the diversity of the sources of and free access to information, and, in particular, 'the urgent need' to change the dependant status of the developing states in the field. The session also proclaimed with a moral tone that 'freedom of information is a fundamental

APPOINTMENT

Centre for Studies in Social Sciences, Calcutta,

invites applications for a post of Professor of Economic History in the pay scale of Rs 1500-150-5700-200-7300/- DA, HRA, CCA as per the Central University Rules. Medical and Contributory Provident Fund benefits are also available. Applicants must have a doctoral degree and sufficient published work in the field of economic history. Command over quantitative methods is desirable. Applications with detailed curriculum vitae including academic qualifications, teaching and research experience and list of publications with names of three referees may be sent to the Registrar, 10 Lake Terrace, Calcutta - 700029 by May 31, 1991.

right and is the touchstone of all the freedoms' and that it requires 'the moral obligation to seek facts without prejudice and to spread knowledge without malicious intent'.

What is our major concern is that after all this initial euphoric optimism and enthusiasm, we do not find any perceptible change in the prevalent information order. This is only a consequence of the sudden halt in the concerted move of the developing states to translate the resolutions in practice. An argument would be that the 'silence' of the developing states is because of the tremendous resistance and pressure—political, economic and psychological—exerted by the West which benefits from the discriminatory order. This, however, is a necessary but not sufficient condition. Our point is that the developing states have their own reasons for maintaining the silence.

Numerous documents prove that the major thrust of the actions of the developing states today is economic. The information question seems to have been put into the back-shelves when it comes to taking concrete actions. The developing states, justifiably enough, strive for economic development but combined pressure of time and necessity lead them to desire it 'overnight'. This desire coupled with dissemination of West-centric world-vision leads to the belief that a particular model is 'historically inevitable' resulting in a blind adherence to the Western model which is also the 'standardising model'. The blind emulation of the development path of the West leads the developing states to seek economic rewards in exchange for their retreat on the issue of transformation of information order. As mentioned in the RIO Report² the resistance offered by the West to any changes in the information order is greater than that in case of the economic order. The West, in fact, is never really in doubt that it is information which holds the key. The developing states, on the contrary, have an implicit assumption that if the West is not pressurised in matters of information, it would, in turn, communicate some 'secrets' of its development strategy as a condescending gesture. For our purpose, it is also important to reassert that the inseparable link between information and economic prosperity is ignored by the developing states at their peril.

ELITE LINKAGES

We have already noted that the reluctance of the developing states to translate their heady optimism imprinted on paper into concrete action is essentially a consequence of strict adherence to a West-centric world-vision. In this context, the following observation of a veteran media-

watcher made during the Gulf war is pertinent: "... Indian newspapers carry, as if they were the gospel truth ... unchecked reports from Western newspapers."³ However, to blame a few news agencies or journalists for this will be gross simplification. One has to recognise that it is the elite of the developing states, which act as 'willing collaborators' in the dissemination of deceptive half-truths. It is the elite which set the rules of appropriate task behaviour and it is their attitude and assumptions, both explicit and implicit, which determine the goals and outcomes of public policies. If one is surprised by the discrepancy that exists between promise and performance, as we mentioned in the case of information order, one only has to take note of the fact that the common vision ingrained among the members of the group and the consequent 'culture of dependency' create a spontaneous loyalty to the West. From the structural-relational perspective of world-system, the expansion-exploitation processes of the 'centre' uses the elite of the 'periphery' as 'agents' in not only perpetuating but also increasing unequal interdependency.

It is the strong international fraternity among the elite that makes an alternative vision or strategy stunted in infancy. The collective bargaining capacity of the developing states becomes a 'victim' of the whole process. The elites of the developing states come together and conduct negotiations based on mutual support but only when they are sure that their mentor-counterparts of the West will be willing to provide few concessions as a token gesture. In most of the cases, negotiations across the table in international conferences, symposia and meets become mere 'verbal duels' and the 'tough stand' taken by the developing states on 'apparently' irreconcilable issues, such as information, remains resolutions. When it comes to the question of implementation of the action programmes, one finds all the zeal and fervour gone.

We have presented and examined the information problematic from the standpoint of the developing states which are always at the receiving end. This is not to overlook the role played by the developed states in retaining the discriminatory information order. If the emphasis is on the developing states it is because of the assumption that while the resistance of the developed states on the issue is natural the decreasing awareness of the developing states is disturbing.

What seems disturbing today may soon become alarming if one puts the information problematic in the broader perspective of world order. Recently, Charles Kranthammer, the well known conservative American, wrote in *Foreign Affairs*: "(The US) will lead in a unipolar world,

unashamedly laying down the rules ... (because) ... the centre of the world power is ... the United States, attended by its (Western allies)." The Gulf war has made inevitable what the world thought was possible: a unipolar world order that has the US as the sole superpower-cum-policeman. With the Soviet Union ridden with internal political and economic problems and China pursuing its traditional path of reflexive insularity, the US which at one time appeared to be defensive, has managed to reemerge with renewed vigour after the Gulf crisis. With President Bush proclaiming the 'indispensability of American leadership' for the world, the desire to establish Pax Americana would naturally cast its shadow on the 'right' of the West to dictate information to the rest of the world.

Judging by the internal and external constraints, the developing states face, to say the least, a very critical situation at the moment. It will be too much to expect them to form a homogeneous group immediately putting the diversities amongst themselves in the background. It is all the more difficult because of the existence of the internal elite who are unlikely to weaken their political, economic and psychological link to the transnational interests. How do we reconcile this gloomy situation to our repeated assertion that the West should not get a 'walk-over' on the information issue? The answer, paradoxically, lies in thorough introspection by the elite, which would result in the realisation that the development strategy, in any case, must not be based on seeking a few crumbs from the West. Such a narrow and short-term strategy (or, to be more specific, tactic) will only act as a hurdle to self-reliance—an imperative necessity for a wider and greater process of the establishment of a world order based on 'concrete and genuine expression of interdependence' and 'effective participation of all in decision-making'. If achieved, it will be a respectable future in which the developing states will participate as full members in their own right. So, it is a 'now or never' situation that the developing states face on the question and it is this constructive lesson that we could learn from the otherwise destructive Gulf war.

NOTES FORMING PART OF THE ACCOUNTS FOR THE YEAR ENDED 31 MARCH, 1991

1 Principal Accounting Policies

i General

The accompanying financial statements have been prepared on the historical cost basis and conform to the statutory provisions and practices prevailing in the country

ii Transactions involving foreign exchange

- Monetary assets and liabilities except for Head Office Balances have been translated at the exchange rates prevailing at the close of the year
- Income and expenditure items have been translated at the exchange rates ruling on the date of the transactions
- Profit or loss on forward contracts have been accounted for

iii Investments

Investments are stated at the lower of aggregate cost or market value and provision is taken for any decline in value

iv Advances

- Provisions for doubtful advances have been made to the satisfaction of the auditors
 - in respect of identified advances, based on a periodic review of advances and after taking into account the portion of advance guaranteed by the Deposit Insurance and Credit Guarantee Corporation, the Export Credit and Guarantee Corporation and similar statutory bodies
- Provisions in respect of doubtful advances have been deducted from advances
- Provisions have been made on a gross basis. Tax relief which will be available when the advance is written off will be accounted for in the year of write off

v Fixed Assets

- Premises and other fixed assets have been accounted for at their historical cost
- Depreciation has been calculated on a straight line basis to write off the cost

of fixed assets over the expected useful lives of the assets duly certified by the management. The principal periods used are

| | |
|------------------------|----------|
| Premises | 25 years |
| Furniture and fixtures | 5 years |
| Equipment | 5 years |
| Motor Vehicles | 5 years |
| Computers | 5 years |

vi Staff Benefits

Provisions for gratuity benefits to staff have been made on an accrual basis. A separate fund for gratuity has been created

2 Advances

Included in the provision for doubtful debts is an amount relating to a customer for which provision has been taken after considering the value of stocks held by the bank as security

Due to the technical nature of the stocks, the value has been determined by the management based upon the invoice value of the stocks

3 Net Profit

The net profit disclosed in the profit and loss account is after

- provisions for taxes on income in accordance with statutory requirements
- provision for doubtful advances
- Head Office Administration Expenses to the extent estimated to be allowable under section 44C of the Income Tax Act 1961

4 General

The figures of previous period have been regrouped/rearranged wherever necessary

Auditors' Report

AUDITORS' REPORT ON THE INDIAN BRANCH OF THE OMAN INTERNATIONAL BANK S.A.O.G. UNDER SECTION 30 OF THE BANKING REGULATION ACT 1949

We have audited the attached Balance Sheet of the Indian Branch of the Oman International Bank S.A.O.G. as at 31 March 1991 and the relative Profit and Loss Account of the Indian Branch of the Bank for the year ended on that date signed by us under reference to this report

In accordance with the provisions of Section 29 of the Banking Regulation Act 1949 read with the provisions of Sub Sections (1) (2) and (5) of Section 211 and Sub Section (5) of Section 297 of the Companies Act 1956 the Balance Sheet and Profit and Loss Account together with the notes thereon are not required to be and are not drawn up in accordance with Schedule VI to the Companies Act 1956. The accounts are therefore drawn up in conformity with Forms A and B of the Third Schedule to the Banking Regulation Act 1949

- (1) We have obtained all the information and explanations which to the best of our knowledge and belief were necessary for the purposes of our audit and have found them to be satisfactory
- (2) The transactions which have come to our notice have been in our opinion within the powers of the Indian Branch of the Bank
- (3) In our opinion proper books of account as required by law have been kept by the Indian Branch of the Bank so far as appears from our examination of these books
- (4) The above mentioned Balance Sheet and Profit and Loss Account of the Indian Branch of the Bank dealt with by this report are in agreement with the books of account
- (5) In our opinion and to the best of our information and according to the explanations given to us the Balance Sheet and Profit and Loss Account together with the notes thereon give the information required by the Companies Act 1956 as amended in the manner so required for Banking Companies and on such basis the said Balance Sheet gives a true and fair view of the state of affairs of the Indian Branch of the Bank as at 31 March 1991 and the Profit and Loss Account gives a true and fair view of the profit of the Indian Branch of the Bank for the year ended 31 March 1991

Gandhi and Ambedkar

Gail Omvedt

The Moral and Political Writings of Mahatma Gandhi, Volume I: Civilisation, Politics and Religion; Volume II: Truth and Non-Violence edited by Raghavan Iyer; The Clarendon Press, Oxford.

THIS is Ambedkar's year. Not only because of the centenary celebrations, but because the theme of 'social justice' has now become central to Indian politics, possibly a determinant in the forthcoming elections, in the process bringing about the unity between dalits and shudras ('OBCs') which Ambedkar had argued for but had grown pessimistic about in the last years of his life.

Yet there has also been a kind of revival of Gandhi in the last several years, answering to the needs of another 'new social movement'. environmentalists have a tendency to look to Gandhi as a founding father, the first leader of contemporary India to denounce the destructiveness of industrial 'modern civilisation' and call for a different model of development entirely. Here also Gandhi stood in contrast not only with Nehru and the Leftists but also with Ambedkar, who supported not only industrialisation but a highly centralised statist form of it, and was more concerned that dalits should be able to leave the villages than reform them. Thus the publication of Gandhi's "moral and political writings", in particular *Hind Swaraj* and the discussions surrounding it, help throw some light on the debates between these two towering figures of the colonial era.

WHY THE CONFRONTATION?

Gandhi and Ambedkar ended in a state of near total confrontation, rather than dialogue, and it is important to understand how this happened. Though many view Gandhi as the great national leader and Ambedkar as the one ready to compromise with the British in putting the 'social movement' first (and react emotionally to them on this basis) the reality is not so simple. Ambedkar's nationalism was expressed at many points, while Gandhi himself made it clear that his first concern was not so much independence but India's identity as a civilisation, and that the worst fate that could befall it would be to get rid of the British only to become like the British, with "the tiger's nature, but not the tiger" (in *Hind Swaraj*, p 208).

The difference was partly in the social networks each was involved in, Ambedkar irrevocably based in the dalit rural and urban poor, Gandhi with his access to all the wealth and resources of the Hindu upper castes. That Gandhi's 'social base' did not see his concerns in quite the same light as he did, is perhaps suggested by the fact that Raghavan Iyer's collection contains very

little specifically on untouchability and caste, though the question was as highly 'moral' and 'political' for Gandhi as anything. Gandhi's taking a position in fact played a central role in building up the Congress as a national force, yet almost all upper caste leaders—including Leftists like Nehru and the communists—saw it as a mere diversion.

Gandhi and Ambedkar had different concerns about what Indian independence should mean, but they were similar in placing the nature of that independence ahead of mere freedom from British control. Was it inevitable that their relations should develop so acrimoniously?

Throughout the 1920s, in fact, Ambedkar seems to have had a soft spot for Gandhi, perhaps taking him as a new phenomenon different from the Brahmanic elitist leaders he hated. A photo of Gandhi adorned the pandal for the Mahad satyagraha; even the demands of the Untouchables then were put in terms of "their rights as Hindus" as Ambedkar held back from a full denunciation of Hinduism.

The real break came in the period 1930-32 with the events of the Round Table Conferences, Gandhi's fast and the Poona Pact. The issue was not Gandhi's nationalism versus Ambedkar's separatism; it was rather that of dalit autonomy within a broader national community. Ambedkar had gone to the first RTC as a representative of the Untouchables, but he was almost alone among organised dalit opinion of the time in not asking for separate electorates, in saying it would be satisfied with reserved seats if there were adult suffrage. At the conference he gave an eloquent expression of support for independence, arguing that Untouchables needed 'swaraj' because only with it could they have a chance of sharing in political power—the prerequisite for their liberation. But, with not possibility of adult suffrage, Ambedkar ended up supporting separate electorates for Untouchables along with those for Muslims and other minorities. It was this that proved too much for Gandhi, and his emotional speech at the second RTC (he did not oppose separate electorates for Muslims) was not so much from a stance as 'national' leader but as a Hindu, and as one who was adamant that Untouchables should be treated as part of Hinduism. "I would not seal the vital interests of the Untouchables even for the sake of winning the freedom of India. I claim myself in my own person to represent the vast mass of the Untouchables", he said, going on to say that

"it would create a division in Hinduism which I cannot possibly look forward to with any satisfaction whatsoever" (Vasant Moon, editor, *B R Ambedkar: Writings and Speeches*, Volume 2, pp 662-63). The issue was precisely whether dalits could attain an autonomy to decide for themselves whether they would be part of 'Hinduism' or not.

The subsequent communal award and Gandhi's fast led to the Poona Pact of 1932, but Ambedkar's agreement was by no means due to a 'change of heart'. Afterwards he spoke of the events with great bitterness, adding "to my mind there is no doubt that this Gandhi age is the dark age of India. It is an age in which people instead of looking for their ideals in the future are returning to antiquity" ('Federation and Freedom', in *Writings and Speeches*, Volume 1, pp 350-52). Yet Ambedkar himself was ready to return to Indian tradition, specifically Buddhism. The problem was that Gandhi's village-centred ideal was, to him, becoming identified with upper caste dominance, with a denial of autonomy. This was confirmed when Gandhi set up the Harijan Sevak Sangh. Ambedkar argued that the aim should not simply be uplift of untouchables but the eradication of castes; and that the main authority in carrying this out should be with dalits themselves. Gandhi refused, seeing the issue as one of purifying Hinduism and of upper caste Hindus 'making expiation' for their sins of Untouchability. Practically the result was to have a nationwide body of high-caste social reformers, wandering through Untouchable quarters cleaning up children and propagandising against drunkenness, diving a certain amount of self-respect but in the process hiding the low castes to a national movement dominated by what Ambedkar saw as the 'bourgeois-brahman' elite. Ambedkar's insistence on dalits and low castes holding power to create their own liberation was certainly correct as against Gandhi's paternalism.

NATURE OF 'MODERN CIVILISATION'

This paternalism was also to flaw Gandhi's most telling critical thrust regarding the path of development itself.

Hind Swaraj, originally written in Gujarati in 1909, was a powerfully argued indictment of industrial civilisation, denouncing parliament, factory exploitation, the practices of modern medicine and law and even modern transportation. Gandhi later came down a good deal from its most extreme directions, but it continued to indicate what he considered an ideal direction, a village-centred, handicraft-oriented production system, with fulfilment of basic but minimal needs. The questioning of modern industrial development in *Hind Swaraj* has come to seem more and more relevant as the ecological and human destructiveness of contemporary capitalism

grows and the 'statist' alternative is discredited. Gandhi also succeeded in giving a mode of action that was an alternate to both 'Moderate' petitioning and extremist terrorism, that was militant, morally-based and capable of rousing the masses.

On these issues Gandhi seems to have more to offer than Ambedkar. Ambedkar was a socialist, which Gandhi was not, and through the 1930s it was with Marxism and the Left that he seemed to be more in interaction/dialogue with than the Gandhians. But the Left was accentuating heavy industry-based centralised development uncritically; the difference between Nehru, the socialists and the communists only boiled down to a matter of degree: how much state control over the industrial sector. The Left also assumed that villages would mainly be a source of surplus, not the heart of society with any dynamism of their own. Ambedkar fitted into this rather easily; villages to him were only 'cesspools' from which dalits must escape; private property was, he assumed, the source of exploitation (he took this as the heart of Marxism, still valid) and thus could be ended by 'state socialism'—nationalisation, the collectivisation of land. This did not deal with hierarchical control of the administrative bodies, and exploitation by the elites (mainly Brahmins) who were at their top. As against this, Gandhi's comment that

God forbid that India should take to industrialisation after the manner of the West. The economic imperialism of a single tiny island kingdom is today keeping the world in chains. If an entire nation of 300 million took the similar economic exploitation, it would strip the world like locusts (cited by Ramchandra Guha, *Chipko: A Grassroots Perspective on the Environmental Debate*, p. 18).

looks remarkably prescient.

But surely part of the reason for Ambedkar's industrialist statism was that the Gandhian alternative—the only viable model appearing at the time—seemed elitist and caste-biased. It was not simply a matter of a village orientation but of 'Ram Rajya' with an uncritical acceptance of elite 'trusteeship'; of an opposition to industrial devastation tied to a religious belief in the limitation of needs. *Hind Swaraj* makes this clear:

We notice that the mind is a restless bird: the more it gets the more it wants, and still remains unsatisfied. The more we indulge our emotions the more unbridled they become. Observing all this, our ancestors dissuaded us from luxuries and pleasures. We have managed with the same kind of plough as existed thousands of years ago. We have retained the same kind of cottages that we had in former times, and our indigenous education remains the same...It was not that we did not know how to invent machinery, but our forefathers knew that, if we set our hearts after such things, we would become slaves and lose our moral fibre. They, therefore, after due deliberation decided that we should only do what we could with our hands and feet...They further reasoned that

large cities were a snare and a useless encumbrance and that people would not be happy in them, that there would be gangs of thieves and robbers, prostitution and vice flourishing in them, and that poor men would be robbed by rich men. They were, therefore, satisfied with small villages...The common people lived independently and followed their agricultural occupation. They enjoyed true Home Rule. (p. 232-33).

The self-sufficient village was linked to the paternalistic rule of kings in a society regulated by intellectuals (Brahmins?). Not surprisingly Ambedkar rejected it. It is however too bad that there was no real debate, throughout the 1930s and 1940s, on the nature of technology and industrialisation in national development.

NONVIOLENT ROAD

With all their differences, Ambedkar and Gandhi stood on the same side on some issues, most crucially on that of non-violence.

Part of the difficulty in dealing with this is that the discussion has been almost ritualised in India—partly perhaps as a reaction to Gandhism. Marxists, at any rate, frequently seem impelled to eulogise violence as their differentiating feature; particularly when, as with the Naxalites, the effort is to break out of the reformism of the established parties and parliamentary framework. 'Violence' is identified with being 'revolutionary'; and even Marxist academics have a strong tendency to argue that 'violence' exerted in social agitations is a sign that more revolutionary, lower-class interests are being expressed, while opting for satyagraha or other nonviolent mass methods is a characteristic of movements based on property-holding interests. This seems to me sociologically invalid, and does not address the question of the strategy appropriate for toiling people's interests. Nor does it explain why Ambedkar opted for nonviolence, unless he is taken as simply a petty-bourgeois mis-leader.

The fact is that there is a clear difference between violence as such and protest which is massive and rule-breaking, illegal in the context of the existing system and oriented to establishing a new system. The latter need not be 'violent' in the context of taking life; and in fact in the broad dialogue of India's independence struggle there have been many definitions of nonviolence; to Gandhi riding on the trains without ticket was at times 'violence'; on the other hand he could only endorse the arguments of Nana Patil regarding the 1942 movement in Satara that they were nonviolent because they destroyed only property in their sabotage and committed personal physical violence (beatings) "only to stop traitors". What Gandhi achieved in his advocacy of nonviolent methods was to establish this mass-oriented controlled militancy, to link it to tradition and Indian culture, giving it a moral base in the readiness to suffer and die for a cause, and evolving in the process new, non-masculinist

definitions of 'manliness'. Whatever, Ambedkar's feelings about Gandhi's backward orientation, he also adopted Gandhian forms of agitation. And the result is that the Indian people today have at their disposal for socially legitimised agitation wider forms of militant and illegal activity than perhaps anywhere, from hartals, and satyagrahas and fasts to 'gheraos', 'rasta rokos', 'gavbandis', and 'panchayat' forms of occupying public space.

The difference between Gandhi and Ambedkar is that Gandhi claimed that non-violence was for him a 'principle' and not just a 'policy' (while for the Congress, he felt, it could only be adopted as a 'policy'), for Ambedkar it was primarily a policy. Yet Ambedkar also quite seriously dealt with the issue of means and ends, which to him was an important differentiating feature between Buddhism and Marxism. If Ambedkar appears more rational to us today, it is not because of the effort to give a moral basis to politics (much of Gandhi is very compelling in this respect) but because the *advaita* base of Gandhi's religion—nonviolence out of a desire to limit action upon the material world; the rejection of needs linked with the rejection of technology and sexuality—is not one which we would choose. Raghavan Iyer gives us in his collection some of the problematic dilemmas of these aspects of Gandhian nonviolence, including the agonising over the mercy killing of a sick calf at his ashram and his apparently unquestioned belief—a stark warning to feminists that their appreciation of Gandhi should be limited—that a girl would be better off being killed one could not prevent her being raped. With all of these problems, the contribution of a nonviolent policy of mass struggle remain, particularly in an age when the forces of military technology are proving to be more rampantly destructive and brutalising than ever.

A Panorama of Polemics

Ashok V Desai

India's Mixed Economy: The Role of Ideology and Interest in Its Development by Baldev Raj Nayar; Popular Prakashan, Bombay, 1989; pp xi + 421, Rs 350.

The Political Economy of India's Public Sector: Policy and Performance by Baldev Raj Nayar; Popular Prakashan, Bombay, 1990; pp ix + 323, Rs 300.

BALDEV RAJ NAYAR must qualify for inclusion in the *Guinness Book of Records*, if only we can discover what for. He never writes one book if two would suffice; but he would not quite make it on that. He has over 500 references in these two volumes, so his rate of assimilation must be fantastic. But then it cannot be proved that he read them all. What I find so unique, so outlandish about him is his undying faith that those with whom he carries on a unilateral debate in his massive volumes—the Leftists—are susceptible to rational argument in respect of the subjects on which he addresses them. In this pair he addresses them on public enterprise. After reviewing the communist theology on the subject, he still optimistically concludes that the communists must *finally* be susceptible to reality because they have to fight elections! He is a starry-eyed idealist looking for red-eyed ideologues. And who knows? He may well be right. The communists have accepted casteist discrimination, partnerships with multinationals, subversion of education—all things against which they might be expected to have principled objection. They may one day even accept the demise of public enterprise, as their elder brothers to our north have done.

Nayar's rock-breaking opus begins with the following sentence.

The rationale for—and evaluation of—the public sector in a country's economy and polity, especially in the Third World, is entwined with questions about both consummatory and instrumental variables.

That sentence set me on fire. I read the entire first volume to find out what was being consummated, but without success. Then I chanced on the second volume—and found the answer on its first page: consummatory factors are ideologies, and instrumental factors are vested interests. It reminded me of Richard Feynman, who went to an interdisciplinary conference and was given a paper to read which he could not make head or tail of. So he decided to translate it sentence by sentence. He came across the sentence:

The individual member of the social community often receives his information via visual, symbolic channels.

He translated it as "people read". Nayar does not keep up this level of profundity; in fact, he is disappointingly comprehensible in general. But he has taken a jolly good shot at being scholarly, cramming 300 references and 1,000 footnotes into the first volume and

200 references and 400 footnotes into the second. These books are a serious, nay, an earnest contribution.

To what? To the politics, economics and history of public enterprises. The first volume covers the attitudes towards it of the people who created the public sector, plus the priesthood that cheered on the assault on the 'commanding heights of the economy'. The former really comprise only Nehru and Daughter; the latter are a swarm of such diverse membership as Biplab Das Gupta, Sukhamoy Chakravarty, Anupam Sen and H Venkatasubbiah. Nayar has certainly read widely and indiscriminately. Some enemies of the public sector figure too (even I figure, although my importance has been exaggerated by attributing to me acts which really belong to Morarji Desai), amongst them, Rajni Kothari occupies the pride of place. The first volume is a *Dogmengeschichte*, or more accurately, a history of a dogma.

The account of attitudes has been interspersed with Nayar's own commentary. The ratio of the first to the second is pretty high; so it is difficult to see what Nayar is driving at. It is like a commentary on the scriptures, where the commentator confines himself to making learned observations on the subtleties of the text that an unsophisticated reader may miss. Even the critical comments that Nayar makes are more like debating points than mortal thrusts. By and large, Nayar has been fair to those whose views he reports, often preferring a direct quotation to an interpretation. But as a result it is difficult to find the real Nayar in this jungle of a text, and often one wonders if there is one.

There is one, and his central thesis is that the build-up of the public sector was decided by Nehru's ideological predilections, and not by the interplay of interests. I think this is meant to be a thrust at Leftists who would believe that all except themselves are pawns in class conflict. But I may well be wrong, for Nayar also admits that the "intermediate strata"—a scholastic term for the middle class—were in power, and that their interests were served by the growth of the public sector. Altogether, it seems that Nayar is in agreement with Prem Shankar Jha, Pranab Bardhan and others who identify the middle class as the driving force and beneficiary of Indian socialism; but one can never be sure, for Nayar revels in highlighting his differences with others.

The second volume does two things. First, it describes the departures from the Nehru ideology in the early days of the Rajiv Gandhi government. Nayar ends this part with one of his best sophistical tricks, showing that the Left, which all along regarded the public sector as a tool of the capitalist state, became its most conservative defender when Rajiv Gandhi's government tried to move away from the Nehru model.

Second, it compares the performance of the leading public and private sector firms in two industries. The case studies of steel (HSL-SAIL vs TISCO) and aluminium (BALCO vs Hindustan Aluminium) can hardly settle the controversies outlined by Nayar in the first volume; but they go far to demoiish, point by point, the claims of superiority and virtue that have underlain the arguments in favour of the public sector. Nayar is no great shakes with the use of statistics; but the microfacts he has collected by the bagful do present a picture which we tend generally to miss.

The first volume would appeal to those who like to wallow in ideological mud—the political economists and the political un-scientists. The second one would be interesting to those who are more interested in the public sector than in the emotions it evokes. Together they form a useful piece of contemporary history.

Volume and Composition of Government Subsidies in India, 1987-88

Sudipto Mundle
M Govinda Rao

This paper attempts to measure the volume and composition of subsidies provided by the Central government and major State governments and concludes that a substantial proportion of GNP, much larger than the explicit subsidy as revealed in the budgets or as computed even by the broader National Accounts definition, is being distributed in the form of subsidies through the Central and State budgets, much of it invisible, and that it is not at all clear that these subsidies are flowing to the intended beneficiaries.

Introduction

ECONOMISTS are interested in analysing government subsidies for a number of different reasons. A macro economist dealing with India's fiscal imbalance, i.e., the growing revenue deficit in evidence since the early eighties, would be interested in better targeting of subsidies and pruning of unintended subsidies as part of a stabilisation programme which attempts to reduce the revenue deficit. A price theorist would be interested in the allocative effects of subsidies while a welfare economist might be interested in their overall welfare effects. Political economists would want to interpret the allocation of subsidies in terms of their perception of the distributive coalitions which control the state. This paper does not belong to any of these particular perspectives. Instead, it undertakes an exercise which is a necessary first step for addressing any or all of these questions operationally. It attempts to measure the volume and composition of subsidies provided by the Central government and fourteen major State governments in India, as observed in the year 1987-88, the last financial year for which complete accounts are so far available. The first part of the paper deals with concepts and method. Part two presents estimates of the volume and composition of subsidies at the national level. Part three analyses inter-State variations and the main conclusions are summarised in part four.

I

Subsidies and Theory of Public Expenditure

Government subsidies may be defined as the difference between the cost of delivering various publicly provided goods or services (henceforth, services) and the recoveries arising from such deliveries.¹ However, a number of qualifications and adjustments must be introduced before this concept can be applied to measure subsidies from the available data on government expenditure and receipts. These are as follows.

(a) Government and Public Sector:

Government has been defined in this exercise to include only those departments which directly come under the Central government or the governments of fourteen major States. In particular, non-departmental public enterprises or co-operatives have been treated as lying outside the government proper. This is admittedly a narrow definition. However, it is necessary in order to frame the interface between the government budget and public enterprises. The difference between financial assistance extended to such enterprises and the returns which government receives from them is included in our measure of the volume of subsidies flowing through the government budget and this component of government subsidy is discussed further below.

(b) *Public Goods*: The wide range of general, social and economic services offered by the government at the Centre and in the States can, for analytical purposes, be classified into three broad groups. At one end of the spectrum there are pure public goods (services) in the Samuelson sense, characterised by non-rivalry and non-excludability in consumption.² At the other end there would be pure private goods characterised by rivalry, excludability and no externality. Then there would be the vast majority of services in the middle category, characterised by rivalry and excludability but also varying degrees of externalities. We may stretch Musgrave's notion to describe this class of services as 'merit goods'.³ Of these, the concept of subsidy is properly applicable only to the last two.

In the case of pure public goods we know from the theory of public expenditure that the well known Samuelson pricing rules cannot in fact be applied because of the free rider problem. Given the characteristic of non-excludability, consumers will not reveal their preferences for such goods and the demand information necessary for calculating Samuelson prices will not be available. Wicksell had anticipated this problem before Samuelson and he, followed by Lindhal and more recently Musgrave, argued that a voting mechanism of near unanimity, choosing between alternative expenditure proposals along

with associated tax prices, could lead to fairly efficient outcomes. However, in the absence of such voting mechanisms, the optimal level of public provision of these services remains indeterminate and their costs have to be met out of the general budget since they cannot be easily recovered.⁴ Under these conditions it would be inappropriate to apply the concept of a subsidy to the expenditure on pure public goods. Could we say, for instance, that defence expenditure is a subsidy?

There is clearly a case for excluding pure public goods from our computation of subsidies. But empirically where does one draw the line between pure public goods and merit goods or private goods? There are obvious public good candidates like defence and police. But then there are less clear cases where the benefits are not immediately tangible, such as agricultural extension, or the beneficiaries not exclusively identifiable, as in a literacy programme. The conservative rule of thumb followed in this exercise is to treat the general administrative services in the functional classification of government expenditure as pure public services, along with relief on account of natural calamities, the general secretariat expenses of social and economic services and the compensation and assignment to Local Bodies and Panchayati Raj institutions. The expenditure incurred on these items has been excluded from the computation of subsidies.

It is possible to take the view that a number of other items, particularly certain social services, are also pure public services. To the extent that these have not been eliminated, the estimated value of subsidies would be larger than the actual value. Readers are welcome to apply their own judgment on which additional social or economic service ought to be treated as a public good and use our disaggregated subsidy estimates to make the appropriate adjustments and arrive at their preferred measure of the total volume of subsidies. However, it must be noted that there could be an element of hidden producer subsidies even in pure public goods, whether they be supplied by government departments or

firms, if these are not supplied cost effectively.

(c) *Transfer Payments and Tax Expenditure*: The public expenditure incurred on transfer payments have been excluded from the computation of subsidies since these cannot be treated as costs incurred in the public provision of a service which could be priced in principle. For the same reason tax expenditures, i.e., revenue losses incurred in tax incentives, have also been excluded from the computation of subsidies though these are usually treated as subsidies in the literature.

(d) *The Different Elements of Subsidy*: The concept of subsidy adopted in this exercise actually combines three different elements of subsidy as demonstrated in the diagram. Let OY be the quantity of some service which is publicly provided, YB the actual cost per unit, YD the efficient cost per unit and EF the curve of per unit recoveries. XX is the demand curve for the service.

The rectangle ABHG measures the total volume of subsidy actually required in order to ensure that the market absorbs OY quantity of this publicly provided service if the market clearing quantity OY' is considered socially inadequate. However, ABHG has two components, i.e., a necessary element CDHG which is a genuine allocative subsidy and an additional element ABDC paid to suppliers to cover their inefficiency. Finally, there is a subsidy element GHFE which need not have been paid to support consumption level OY, given the state of demand. We may therefore describe this as a purely distributive subsidy. Thus, our measure of subsidy which conceptually corresponds to the rectangle ABFE, in fact combines three distinct elements, i.e., a producers subsidy, the allocative subsidy and a distributive subsidy. However, it is not possible to disentangle these different elements of the subsidy without detailed estimates of cost and demand functions for all the different subsidies.

(e) *Method of Computation*: The exercise covers the provision of public services by the Central government and fourteen major State governments for the year 1987-88. In all, there are 123 major categories of public services or sectors of government activity identifiable from the budget classification, of which 37 sectors in general administrative services, etc., are treated as pure public services. For each of the remaining 86 social and economic services subsidy has been computed as

$$s_j = v_j + i(K_j + L_j) + dK_j - y_j - r_j - t_j \quad (1)$$

where $j = 38 \dots 123$ indexes the services.

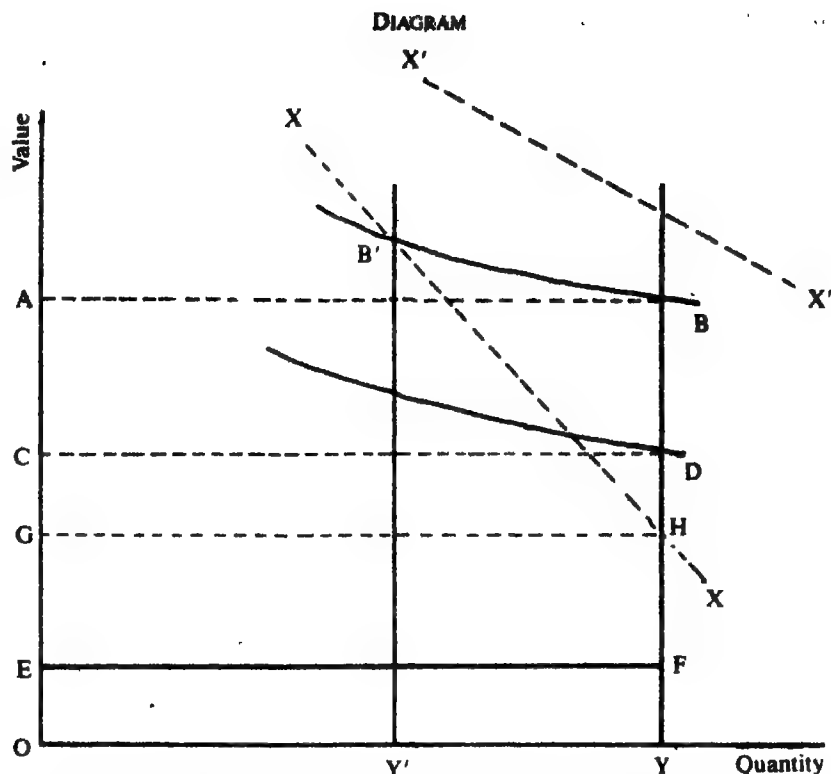

For the j^{th} sector;

s_j is the subsidy;

v_j is the variable cost or revenue expenditure on the service;

K_j is the capital stock in the sector;

L_j is the stock of investments outside government by the sector in the form of loans or equity;

i is an imputed interest rate representing the opportunity cost of money for government;

d is the depreciation rate;

y_j is revenue receipts by the sector;

r_j is income by way of interest or dividend on loans and equity; and

t_j is a transfer payment from the sector to individual agents.

The total volume of subsidies on all services is given by

$$S = \sum_{j=38}^{123} s_j \quad (2)$$

Similarly the cost of any service j ($j=1 \dots 123$) is given by

$$c_j = v_j + i(K_j + L_j) + dK_j - t_j \quad (3)$$

while the total cost of all services, including transfer payments and pure public services is given by

$$C = \sum_{j=1}^{123} c_j + \sum_{j=1}^{123} t_j \quad (4)$$

Notice that in calculating the cost of a service we have added the variable cost or revenue expenditure (net of transfer payments) of the sector with the imputed interest cost of cumulative capital expenditure by the sector and the depreciation on capital accumulated within the sector. It is this interest cost and the depreciation rate which together constitute the element of fixed cost associated with the current level of a service and not the capital expenditure of the sector in the current period. That will form a component of the cumulative capital expenditure which supports future deliveries of services from the sector. Therefore c_j is not the same

as total expenditure of the j^{th} sector and C is not a measure of the total volume of public expenditure.

The imputed interest rate or the average cost of money to the government, calculated as the ratio of domestic interest payments by government to the stock of domestic public debt, works out to 6.04 per cent. The depreciation rate has been set at 2 per cent in real terms, assuming an average life of fifty years for capital stock in government activities as on March 31, 1987.³ Allowing for an inflation rate of 7.4 per cent this works out to 10.4 per cent depreciation in nominal terms.

The data used for the exercise has been drawn primarily from the Finance Accounts of the Union and State governments published by the Office of the Comptroller and Auditor General. This has been supplemented by additional information drawn from budget documents and the *Indian Economic Statistics: Public Finance* published by the ministry of finance.

The concept of subsidy employed in this study should be distinguished from the concepts used in the budget and National Accounts. The concept of 'subsidy' used in the budgets simply applies to the explicit payments made to producers to alter their price or output decisions. The best examples are the food and fertiliser subsidies. The National Accounting concept is broader as it includes, in addition to these explicit payments, the implicit subsidies arising from the losses of departmental enterprises. The concept of subsidy employed in this study is still broader because, in addition to the National Accounts concept of subsidies, it includes subsidies to households implicit in the provision of social and economic services.

below cost as well as the unrecovered cost of loans given and investments made in non-departmental enterprises and co-operatives.

(f) *Potential Sources of Bias:* It has already been noted above that the volume of subsidy measured in this exercise may be an under estimate because it excludes tax expenditures. Another possible source of under estimation could be some services, e.g., higher technical education such as medicine or engineering, where the market clearing price may be higher than the actual cost of supply, viz., a state of demand illustrated by curve $X'X''$ in the diagram. On the other hand, there are also some sources of upward bias in our estimate. The possibility of some pure public services not being excluded from the computation has been noted earlier. In addition we must remember that if the existing level of subsidies, and therefore the aggregate level of public expenditure were to be reduced, then *ceteris paribus* this would also reduce the level of aggregate output and the volume of revenue. Thus, in principle, subsidies should be calculated net of the revenues which they indirectly generate. Keeping in view these possible sources of bias it must be emphasised that the estimates presented in this paper should be regarded as nothing more than a first approximation.

II

Level and Composition of Subsidies: All India, 1987-88

(a) *The Volume of Subsidies:* Going by this user charge method of costing public services, the total cost of all services plus transfer payments for the year 1987-88 worked out to Rs 91,276 crore, of which Rs 48,599 crore was accounted for by the Centre and the balance of Rs 42,677 crore was attributable to the States. Compared to the accounts figures of total government expenditure in that year of the order of Rs 1,01,754 there is a difference of about Rs 10,000 crore. This difference arises primarily because in this exercise the imputed interest cost and depreciation on the cumulative capital expenditure shown in the accounts has been taken as the fixed cost element instead of the actual capital expenditure in 1987-88.

Transfer payments, including the allocation for employment programmes, amounted to Rs 3,836 crore in 1987-88 and the cost of pure public services (general services) accounted for another Rs 25,000 crore. The balance Rs 62,440 crore would have been the total user charge on social and economic services provided by the Central and State governments, if these services were not subsidised. In fact only 32 per cent of the cost of these services was recovered, thus leaving a subsidy element amounting to Rs 2,324 crore or almost 70 per cent of the cost of these services. As a proportion of GDP this works out to about 15 per cent (Table 1). A little over a third of this total bill of subsidies, adding up to about Rs 16,065 crore, flowed through the Central government and

the rest through State governments, even though the aggregate cost of social and economic services is more or less evenly shared between the Centre and the State governments. This is because the States account for the bulk of social services, which are more heavily subsidised as a matter of policy, while the Central government is predominant in the provision of economic services. These details are discussed further below. It is this difference in the composition of publicly provided services which also accounts for a lower overall recovery rate of 16 per cent in the States as compared to 48 per cent at the Central level.

It should be clarified here that in calculating the recovery rate of the States, receipts in the form of transfers from the Centre have not been counted and these have also been excluded from the expenditure side of Central government accounts. These receipts and expenditures cancel out when the accounts of the two levels of government are combined for a consolidated picture of government finance. Even if the accounts at different levels of government are analysed separately it would be odd to treat such transfers at the Central level as expenditure on services which it has not delivered and at the State level treat them as if they were recoveries from recipients of publicly provided services at the State level.

(b) *Social Services:* Social services accounted for 40 per cent of the total volume of subsidies or about Rs 16,760 crore in 1987-88. This works out to almost 6 per cent of the GDP in that year. As noted above, the major component of these subsidies on social services, amounting to Rs 14,460 crore, flowed through the budgets of the State governments. These social services have been provided virtually free to the recipients as a deliberate matter of policy, with less than 4 per cent of the cost of these services being recovered (Table 2). Such a policy could be seen as an effective redistributive measure if the subsidies were targeted to reach intended beneficiaries. Experience has shown that progressive tax structures by themselves are usually not very effective redistributive instruments, whereas the expenditure on social services covers all the non-food basic needs items which are known to be highly correlated with welfare indicators in the physical quality of life index.⁶

However, the data presented here does not indicate that the subsidisation of social services is being effectively targeted towards disadvantaged groups. Take for instance education—the single largest item of subsidies which alone accounted for Rs 9,576 crore or 23 per cent of all subsidies (Table 2). Much less than half of this was spent on primary education. The major component of Rs 5,460 crore was spent on secondary and higher or technical education, sports, art and culture (Table 3). In our view, this reflects rather weak targeting of the disadvantaged in a situation where 64 per cent of the population is illiterate. This issue is further discussed

in the inter-State analysis of subsidies in Section 3. It is worth noting that user charge recoveries from secondary education and, especially, university or technical education such as medicine and engineering would make it possible to almost double the volume of subsidies in primary education even without any increase in the total volume of subsidies. Of course, this would require associated action, such as means test scholarships and special bank loan schemes, to ensure that higher levels of education remain accessible to the disadvantaged. These issues are not pursued further in this paper.

Poverty group targeting in the allocation of subsidies in other social services appears to be equally weak. In health services, for instance, out of total subsidies of the order of Rs 2,925 crore in 1987-88, less than Rs 600 crore flowed to the rural sector. Similarly in the case of water supply, sanitation and housing, out of a total subsidy of Rs 2,363 crore, only Rs 823 crore flowed to the rural sector. Such an allocation of subsidies does not even appear to be equitable, let alone progressive, given that about 76 per cent of the total population and the vast majority of those below the poverty line live in rural areas.

Clearly, there would be much room for substantially increasing the volume of carefully targeted subsidisation of social services to genuinely deserving sections of the population, even without any increase in the total volume of subsidies, if a serious attempt could be made to prune subsidies flowing to unintended beneficiaries. Whether or not such expenditure switching is compatible with the political economy of fiscal policy in India is, of course, another matter.

(c) *Economic Services:* Subsidies in economic services amounted to Rs 25,564 crore or about 60 per cent of the total volume of subsidies. A little over half of this flowed through the Central budget. Costs were not fully recovered in any economic service and the average recovery rate was less than 44 per cent. However, there was considerable variation around this average with recovery rates varying from as little as 20 per cent to over 75 per cent (Table 4).

The highest recovery rates of 75.7 per cent and 70 per cent were recorded in items like transport and communications. Disaggregated data show that these rates were in fact higher for some items, e.g., 95 per cent in the case of rail transportation. However, the sector averages were brought down by very low recovery rates of around 3 per cent in other items like roads and bridges. Given the critical role of infrastructure like transport and communications and their relatively impressive performance in cost recovery, it is unfortunate that the share of these sectors in aggregate public expenditure has tended to diminish⁷ in recent years.

We next come to power and energy which is generally believed to be a major area of hidden subsidies. Admittedly, the recovery rate of around 35 per cent in this sector is only about half of that observed in transport

and communications. However, it is much higher than the recovery rates recorded in services relating to agriculture or industry and the subsidy of Rs 3,221 crore to power and energy, in fact, accounted for less than 8 per cent of the total volume of subsidies in 1987-88. Much of this covered the losses of State Electricity Boards.

The average recovery rate in services related to industry was only about 25 per cent and the volume of subsidies close to Rs 5,000 crore. However, of this over Rs 2,000 crore flowed as subsidies to the fertiliser industry alone and it is debatable whether this element should be treated as a subsidy to the industry or to the activity of crop production. This issue is taken up further below. Apart from fertilisers the other industries which absorbed substantial subsidies in 1987-88 include village and small industries (Rs 640 crore), engineering and telecommunication equipment (Rs 490 crore), consumer industries (Rs 490 crore) and atomic energy (Rs 342 crore).

Finally, we come to agriculture and co-operation. The cost of these services, taken along with irrigation and flood control, was close to Rs 15,000 crore. Only about 20 per cent of this cost was recovered, leaving a subsidy element of around Rs 11,554 crore. This works out to a little under half the total volume of subsidies in economic services. The bulk of this subsidy in services related to agriculture obviously flowed through the State budgets since they account for an overwhelming proportion of the outlay on agri-

culture and irrigation.

The single largest item in the bill of subsidies to agriculture is the food subsidy which amounted to Rs 2,572 crore in 1987-88. Here, a question arises as to whether the difference between the cost of grains to government, calculated as a mark up on the procurement price, and the issue price of grain in the public distribution system should really be treated as a subsidy to crop production or to consumers. This will make no difference to the total volume of subsidies, but it will effect our assessment of the incidence of subsidies. This question is discussed further below.

Apart from food, the other important items of subsidy to agriculture include various types of rural development and special area programmes (Rs 1,397 crore), crop husbandry (Rs 1,105 crore), animal husbandry (Rs 472 crore) and agricultural research, etc. (Rs 384 crore). The subsidy in major and medium irrigation, minor irrigation and flood control worked out to Rs 2,679 crore, Rs 1,362 crore and Rs 327 crore respectively.

(d) *Subsidy to Public Enterprises:* We turn now to the interface between government and the public enterprises. It was explained in Section I that the subsidies estimated in this paper are only the subsidies flowing from government proper. Subsidies extended by public sector enterprises to the rest of the economy are not estimated. However, we do estimate the extent of net budgetary support or subsidy to the public enterprises

themselves from the government. These are shown separately for departmental enterprises, non-departmental enterprises and co-operatives in Table 5.

Subsidies to public enterprises added up to Rs 15,080 crore or a little over a third of the total volume of government subsidies in 1987-88. Of this, Rs 9,213 crore went to Central public enterprises whereas the State level enterprises received Rs 5,866 crore worth of subsidies. The average recovery rate was only 55 per cent for the public enterprises sector as a whole, while the average rate for State level enterprises was still lower at 41 per cent.

In other words, far from contributing a net surplus to the revenues of the government, the public enterprises have remained a major source of resource drain from the government. In the present fiscal crisis this calls for a major policy reform *vis-a-vis* the public sector. Ways must be found of hardening their budget constraint and ensuring some improvements in their financial performance so that they at least cease to drain financial resources from the government, even if they are not able to immediately contribute a net surplus to the revenues of the government.

It is interesting to note in this context that there is considerable variation between the recovery rates from different types of public enterprises. The recovery rate from co-operatives is the lowest at 20 per cent. However, since the total cost incurred on this category of enterprises is quite small, subsidies to co-operatives account for less than

portant contrast is between non-departmental enterprises and departmental enterprises which account for 16 per cent and 18 per cent of total subsidies respectively. The recovery rate from the former is only about 30 per cent as compared to an average recovery rate of 67 per cent realised from the latter. Thus, the rate of resource drain is much higher in the case of non-departmental enterprises as compared to the departmental enterprises. This is despite the fact that the former includes all the oil companies which have been enjoying windfall gains because of the oil shocks. If these were excluded, the recovery rate from non-departmental enterprises would be even lower.

(c) *The Rural Share of Subsidies:* Measurement of fiscal incidence or the incidence of taxes and subsidies remains one of the most intractable problems in public finance and certainly no firm measure of the incidence of subsidies can be culled out of the present data. Nevertheless, some very broad contours of the pattern of subsidy incidence have been indicated such as the share of social and economic services, the share of public enterprises and so on. We now present an estimate of the share of the rural population in total subsidies.

Each item of subsidy has been classified as rural or non-rural based on the evidence available in the budget documents about the identity of the beneficiaries. However, there are three major items where such an unambiguous classification was difficult. The largest item is education which accounted for 23 per cent of all subsidies as indicated earlier. It has been assumed here that the flow of education subsidy to the rural sector is in proportion to its share of popula-

The other two items are food and fertiliser which respectively account for about 6 per cent and 4 per cent of all services. In the basic classification the food subsidy is shown under agriculture which is included in the rural sector. However, it is arguable that much of this subsidy flows to the urban sector since a major portion of the actual off-take of subsidised foodgrains from the public distribution system actually goes to consumers in urban areas. In the case of the fertiliser subsidy, on the other hand, though in the basic classification it appears as a subsidy to the fertiliser industry, it can be argued that the beneficiaries of this subsidy are really the farmers belonging to the rural sector.

Estimate II in Table 6 gives an upper bound estimate of the rural share in subsidies by including both the food and fertiliser subsidies along with the rural share of the education subsidy. Estimate III gives a lower bound estimate which includes the rural share of the education subsidy but not the food and fertiliser subsidies. Estimate IV is our preferred estimate which includes the rural share of the education subsidy and the fertiliser subsidy, but not the food subsidy. With these assumptions it turns out that the rural share lies between 41 per cent and 53 per cent of the total volume of subsidies. Our preferred estimate places it at about 46.5 per cent. It may appear that some rural-urban inequity is implied here since the rural share is less than in proportion to its share of population and per capita incomes are also lower in the rural sector. However, any such inference about fiscal incidence would be premature without taking into account the flow of transfer payments and the in-

is likely to be lower for the rural sector.

III

Inter-State Analysis of Budgetary Subsidies

The analysis of subsidies at the all-India level presented above cannot address a number of subsidy related issues which come into focus only when the data are analysed at the level of the States. For example, the problem of resource inadequacy is particularly severe at the State level⁶ and this underlines the urgency of targeting subsidies for the intended groups and making adequate cost recoveries from those with higher purchasing power so that the prevailing levels of social and economic services which are abysmally low can be expanded to satisfactory levels and equitably distributed.

(a) *Inter-State Analysis of Subsidy:* As indicated in section 2, the total cost of providing public services and transfers in the States in 1987-88 amounted to Rs 42,677 crore. The cost of general and administrative services was Rs 8,070 crore and transfer payments amounted to Rs 3,186 crore. Of the total cost of social and economic services of Rs 31,422 crore, cost recoveries amounted to Rs 5,162 crore, leaving the subsidy amount of Rs 26,259 crore or 7.9 per cent of GDP. The subsidy amount formed over 62 per cent of the total cost of public services and transfers.

The most notable feature of inter-State distribution of subsidies presented in Table 3.1 is its inequitable spread. It is clearly seen that more than a proportionate share of subsidies accrued to the high and middle

with only 20 per cent share of population claimed almost 26 per cent of the subsidies, whereas the share of the five low income States with over 46 per cent of population was only about 38 per cent. In fact, all the high and middle income States with the sole exception of West Bengal claimed a share of subsidies higher than their population share. Similarly, in each of the low income States with the exception of Rajasthan, per capita subsidies were lower than the all-States average. While, for the high income States taken together per capita subsidies amounted to Rs 466, the corresponding figure for the low income States was just about Rs 299. This was lower than the all States average by 17 per cent. Per capita subsidies in the middle income States amounted to Rs 384 which was higher than all-States average by 6 per cent.

Per capita subsidies in high and middle income States were larger because either the per capita expenditures in these States were higher or their recovery rates were lower. So far as recovery rates are concerned our analysis shows that recoveries as a ratio of the cost of social and economic services were, by and large, very low with an average of 16 per cent for the States taken together. In eight States, it was less than 15 per cent, the lowest being about 6 per cent in West Bengal. Only in four States, it was higher than 20 per cent. However, inter-State differences in subsidy levels cannot be largely

since they do not seem to follow any systematic pattern (see, Table 7) consistent with differences in subsidy levels. In fact, recovery rate in the middle income States was only 12 per cent whereas, in the low income States it was 17 per cent. Nevertheless, in the States of Gujarat, Kerala, Punjab and Tamil Nadu, the higher subsidy levels have to be partly attributed to their lower recovery rates. In contrast Haryana, Karnataka and Maharashtra present cases where subsidy levels were higher despite relatively high recovery rates and among the low income States, Bihar and Madhya Pradesh present cases of low subsidy levels with high recovery rates.

The observed pattern of higher per capita subsidies in more developed States clearly shows that subsidy levels were higher in States with higher capacity to raise revenues. In other words, the federal transfer policy has failed to achieve its major objective, namely, offsetting the lower revenue raising capacities of fiscally disadvantaged States. In other words, Central transfers have failed to enable the fiscally disadvantaged States to provide a standard⁹ level of public services at a uniform tax-effort. Consequently, the residents in fiscally disadvantaged States have had to be satisfied with lower levels of services as well as lower subsidy levels than their counterparts in the better off States.

(b) *Subsidy in Social Services:* Subsidies in the provision of Social Services in all the major States taken together amounted to

of the total subsidy flowing through State governments. Among the social services, subsidy in education alone constituted over 32 per cent of the total subsidy, while the subsidy to protective and preventive health care (medical, public health, water supply and housing) constituted another 18 per cent.

The estimates presented in Table 8 show that in each of the 14 major States, social services claimed a predominant share of subsidies ranging from 47 per cent in Haryana to about 68 per cent in Kerala. The broad similarity in the relative shares of various sub-sectors of social services among the States is also notable. In every State, the highest share of subsidy was in education. A large share of subsidy was also claimed by protective and preventive health care (including medical, public health, water supply, sanitation and housing) in all the States. Considering that social services accounted for almost 50 per cent of subsidies in many of the States, it would be instructive to analyse this in greater detail.

The most striking feature that emerges from the analysis of subsidies in education and health is that, generally, per capita subsidies were higher in the States where the levels of educational and health services were also higher and vice versa. In the case of education, for example, per capita subsidies were higher in States where the literacy rates were higher. In Kerala, both the literacy rates

and per capita subsidies were the highest. Similarly, in the States of Gujarat, Karnataka, Maharashtra, Punjab and Tamil Nadu where literacy rates were higher than the all-States average, the per capita subsidies were also substantially higher. Subsidy levels were the lowest in Bihar, Madhya Pradesh, Orissa and Uttar Pradesh all of which had very low literacy rates.

A similar positive association between levels of the service and per capita subsidy is also noticed in the case of preventive and protective health care (medical, public health, water supply, sanitation and housing). In the States of Haryana, Karnataka, Kerala, Maharashtra, Punjab and West Bengal the infant mortality rate were very low indicating substantially higher than the average availability of health care services. These were also the States with higher per capita subsidies in protective (medical and public health) health care services. In Kerala, which had the lowest infant mortality rate (27 per cent per 1,000 births), per capita subsidy in protective health care was higher than the average by 33 per cent. In Punjab where per capita subsidies were higher than the average by 54 per cent, the infant mortality rate was 29 per cent lower than the average. Similar pattern can be observed in the case

of subsidies in preventive health care services also.

Thus it is seen that per capita subsidies in social services were larger in more developed States. What is more, even within the States the benefit of subsidies is concentrated to a small proportion of the population. Even in less developed States, although per capita subsidies were lower, it is probable that the benefit of subsidies accrues mainly to a smaller proportion of population which is literate. Therefore, per capita subsidy received by the benefiting group may not be very much lower even in less developed States. The more literate who also have greater purchasing power seem to have better access to social services and, therefore, it would be reasonable to infer that the benefit of subsidy in social services accrues mainly to this small and relatively privileged proportion of population.

The data presented in Table 9 also show that the recovery rates in social services were extremely low in all the States, only 5 per cent or less. The recovery rates were very low both in education and health sectors. Clearly, the low recovery rates reflect a deliberate policy of providing these services free or at very low prices. However, the consequence is that small and relatively privileged section

of population who have better access to social services get them virtually free, and hence, appropriate large consumer surpluses while the vast majority do not even have access to these services, let alone, availing the subsidies involved in their delivery. Ensuring greater accessibility to larger proportion of population involves both better targeting and massive expansion in the levels of these services. Given the severity of the resource constraint with the States, expansion in the levels of services can come about only by charging higher user charges on those consumers having higher purchasing power. In fact, in the case of higher education and technical education, there is no reason why greater recoveries cannot be made from economically better off consumers. At the same time, it is necessary that the benefits of these services should be made accessible at subsidised rates to those who are economically disadvantaged.

We may now look at some equity aspects of the subsidy to the education sector. As mentioned above, education accounts for almost a third of total subsidies at the State level. The composition of subsidies in various sub-sectors within the education sector presented in Table 9 points to a number of important inferences. First, in spite of the

in the States are illiterate, the allocation to primary education was just about 48 per cent. Thus, more than a half of the subsidies in education is allocated to higher levels. The pattern was broadly similar in all the States, the share of primary education ranging from 39 per cent in Haryana and West Bengal to 57 per cent in Bihar, Madhya Pradesh and Orissa.

The bill of subsidies on higher, technical and other education which accrues largely to the literate sections of population

this has to be added an additional amount of Rs 210 crore on account of agricultural education and Rs 190 crore due to medical education. Thus, the total subsidy bill involved in higher levels of education amounts to a staggering Rs 1,900 crore. It may be noted that complete cost recoveries at higher education levels can augment the primary outlay on education almost by 50 per cent. Of course, this is not to imply that economically weaker sections availing higher educational facilities should not receive sub-

sidy target the subsidies on higher educational levels. These statistics sharply underline the inequitable allocation of subsidies not merely in terms of the regional spread but also in terms of the distribution between the better off and the worse off within the regions.

Reduction in the subsidy to the privileged groups can be achieved only by enhancing recoveries on higher education. It is interesting to note that recovery rates on higher education for the States averaged only 1.7 per cent, which was lower than even the

| b Alternative 2 | 302.58 | 240.15 | 473.58 | 525.33 | 325.92 | 314.42 | 349.15 | 245.38 | 266.43 | 397.49 | 355.39 | 273.44 | 212.77 | 238.34 | 288.43 |
| c Alternative 3 | | | | | | | | | | | | | | | |
| IV Share of rural population** in total population (per cent) | 76.7 | 87.5 | 68.9 | 78.1 | 71.1 | 81.3 | 79.8 | 65.11 | 88.2 | 72.3 | 79.0 | 67.0 | 82.0 | 73.5 | 75.7 |
| V Share of rural subsidy in total states subsidy | 69.21 | 86.67 | 64.93 | 79.42 | 59.08 | 61.08 | 79.32 | 41.27 | 66.62 | 47.16 | 67.59 | 47.74 | 63.31 | 54.48 | 62.31 |
| a Alternative 1 | 59.29 | 86.28 | 61.21 | 78.22 | 55.55 | 61.53 | 78.53 | 39.38 | 64.98 | 46.04 | 66.59 | 41.34 | 63.41 | 53.74 | 59.84 |
| b Alternative 2 | 59.34 | 86.28 | 61.32 | 78.22 | 55.55 | 61.54 | 78.53 | 39.98 | 64.98 | 46.04 | 66.59 | 41.34 | 63.41 | 53.74 | 59.85 |
| c Alternative 3 | | | | | | | | | | | | | | | |

Notes: Alternative 1 Includes both food and fertiliser subsidy and rural share of education subsidy estimated in proportion to the share of rural population. Alternative 2 Excludes both food and fertiliser subsidy from Alternative 1. Alternative 3 Excludes food subsidy from Alternative 1.

* Estimated by applying the rural share of population in 1986 projected by the Office of the Registrar General on the mid year population of 1987-88.

** According to 1981 census.

UNIVERSITY OF DELHI

DELHI-110 007

No. Estab. IV/Advt.-129/

Dated, April 30, 1991

Applications, on the prescribed form, are invited for the following posts in the University so as to reach the Registrar, University of Delhi, Delhi-110 007, latest by May 31, 1991:

1. AFRICAN STUDIES

Reader in Geography (1)

Special/desirable qualifications (if any):

- (a) Doctorate Degree or published work on Africa;
- (b) field work in Africa or visiting assignments at an African University;
- (c) knowledge of an African language

2. LAW FACULTY

Professors (2)

Lecturers (2)

Research Associates (2)

Special/desirable qualifications (if any).

Professors:

One in International Business Law including Taxation and other in Science, Technology & Environment or in Law & Development

3. GERMANIC & ROMANCE STUDIES

Reader in German (1)

Lecturer in German (1)

(Leave vacancy upto 05/11/91 but likely to continue)

Special/desirable qualifications (if any)

Reader German Literature

4. PERSIAN

Research Associate (1)

5. MANAGEMENT STUDIES

Placement Adviser (1)

Special/desirable qualifications (if any)

A person having Industrial background or the knowledge of

working of private and/or public undertakings or educational institutions with special reference to placement and training work will be given preference.

6. HINDI

Lecturers (2)

7. CENTRAL OFFICE

I. System Analyst-cum-Senior Programmer (Finance Wing) (1)

Special/desirable qualifications (if any)

- a) Experience of participation in training programmes in Computer related disciplines
- b) Intensive experience in System Programming on a Third Generation Computer System

II. Deputy Registrars
(Panel to be drawn)

III. Assistant Registrars/
Administrative Officers:
Assistant Controller of
Examinations
(Panel to be drawn)

IV. Junior Programmer
(Finance Wing) (1)

Special/desirable qualifications (if any)

- a) Experience of participation in training programmes in Computer related disciplines, and
- b) knowledge of an assembly language

8. ENGINEERING DEPARTMENT

University Engineer (1)

Number of posts is given, within parenthesis, against each post.

SCALES OF PAY :

Professor/University Engineer:
Rs 4500-150-5700-200-7300

Reader/System Analyst-cum-Senior
Programmer/Deputy Registrar/
Placement Adviser
Rs 3700-125-4950-150-5700

REGISTRAR

Except in Gujarat and Kerala where the rates were a little over 5 per cent and 7 per cent respectively, all the States had recovery rates lower than 3 per cent. In as many as five States, it was even less than 1 per cent. In technical education too, the recovery rate was only 5.7 per cent on the average and 5 per cent in eight States including the economically more advanced States of Gujarat (3 per cent), Haryana (1.8 per cent) and Punjab (3 per cent), the rates were lower than 5 per cent.

Apart from the stated equity consideration highlighted above, the low recovery rates in social services also have an unfortunate dynamic implication. It has been noted elsewhere that the expenditure on social services has been growing faster than both general and economic services. If the recovery rates continue to remain at such low levels, it follows that both inter-regional and inter-personal inequity in the allocation of subsidies will increase over time. Better targeting of subsidies in social services, perhaps through differential pricing should therefore, constitute an important item on the agenda on fiscal reform.

(c) *Subsidy in Economic Services* The quantum of subsidies in economic services amounted to Rs 11,800 crore, forming about 45 per cent of the total bill in the 14 major States taken together. The largest component of this amounting to Rs 4,465 crore was absorbed in irrigation and another Rs 4,010 crore was in agriculture and allied activities. Other important sectors involving significant subsidies include irrigation, power and transport and communication sectors. These together accounted for almost Rs 7,600 crore of subsidies.

The inter-State variation of subsidies in economic services pictured in Table II again points towards a large concentration of subsidies in the more developed States. In Punjab, per capita subsidy on economic services amounted to Rs 326 which was more than 3.3 times the amount in Bihar, the least developed State and about two times the average. In Gujarat and Haryana, the subsidies were higher than the average by 57 per cent and 65 per cent respectively. On the other hand, as mentioned above, per capita subsidy in Bihar amounted to only Rs 98 and in Uttar Pradesh and Madhya Pradesh at Rs 126 and 146, it was lower than the average by 18 per cent and 4 per cent respectively.

The inter-State distribution of subsidies in some important economic services also points towards the inequitable pattern observed above. In irrigation, significantly larger than the average per capita subsidies accrued to the residents of better off States like Gujarat, Haryana and Punjab. However, higher levels of subsidy were also seen in some of the poorer States like Madhya Pradesh, Orissa and Rajasthan. At the same time, within the States there is no evidence to show that the benefits of irrigation sub-

sidy consequence of improperly designed subsidy schemes is the possibility of over use of water resources and undesirable changes in the cropping pattern induced by subsidised irrigation. Of course, this is not to argue that subsidising irrigation *per se* is undesirable. What is implied, however, is the need to ensure that the objectives of such subsidisation should be clear and it should not result in unintended resource misallocation. With regard to other subsidies in agriculture and allied activities, the shares of agriculturally advanced States of Gujarat, Haryana, Maharashtra, Punjab and Tamil Nadu were much higher than their population shares. In the power sector also a very high percentage of subsidies went to agriculturally advanced States like Haryana, Punjab and Tamil Nadu, largely on account of the abysmally low rates of power tariff levied on electricity consumed for irrigation purposes.

Irrigation and power, along with road transport, constitute three important economic services accounting for about 29 per cent of total State subsidies mainly because of low recovery rates. In irrigation in all the States except Maharashtra (41 per cent) the recoveries were less than a third of the cost and lower than 10 per cent in Bihar, Kerala, Madhya Pradesh and Orissa. The average recovery in the States taken together was just about 21 per cent. In the power sector in all the States except Karnataka and Kerala the volume of subsidies on account of recoveries was substantial. The all States average recovery rate was about 28 per cent. However, in Bihar, Gujarat, Rajasthan, Tamil Nadu and Uttar Pradesh there was virtually no recovery and in Punjab and West Bengal the recovery rate was as low as 6 per cent. In fact, in Punjab per capita subsidy in the power sector at Rs 123 was about 6 times the average. In the transport sector the average recovery rate was only 13 per cent and in as many as 9 States including the more advanced States of Gujarat and Kerala, recovery rates were less than 5 per cent of the cost.

(d) *Budgetary Subsidy to Public Enterprises* The flow of subsidies to public sector enterprise as a whole have been analysed in section II. We now take up the flow of subsidies to these enterprises at the State level. Table I presents the subsidies given to departmental and non-departmental enterprises as well as to co-operatives in 14 major States. In the aggregate, the total subsidy accruing to public enterprises and co-operatives amounted to Rs 5,866 crore, forming 22 per cent of the total subsidy given at the State level. However, the share showed wide variation across States, ranging from 7.5 per cent in Bihar to over 38 per cent in Punjab.

In the aggregate, the largest share of State subsidy, constituting almost 14 per cent, accrued to departmental enterprises, while the subsidy to non-departmental enterprises constituted about 7 per cent. Departmental enterprises claimed a larger share of subsidy in all the States except Punjab and Tamil

Nadu. The share of subsidies to non-departmental enterprises was larger. This is mainly due to the large subsidies accruing to the electricity boards in the States. The share of co-operatives in total State subsidy averaged to about 1 per cent in the States taken together and it was generally low in all the States.

In no State was the recovery rate high enough to meet the entire cost of providing the services, in the case of either departmental or non-departmental enterprises or co-operatives. The average recovery rates in departmental enterprises (46 per cent) was higher than in non-departmental enterprises (32 per cent) and co-operatives (29 per cent). This pattern however was not uniform across the States. In fact, the recovery rates showed very wide inter-State variations with respect to departmental and non-departmental enterprises as well as co-operatives. In the case of departmental enterprises, the rate varied from 19 per cent in Punjab to about 92 per cent in Bihar. Similarly, the variation in non-departmental enterprises ranged from less than 3 per cent in Rajasthan, Tamil Nadu and West Bengal to more than 90 per cent in Andhra Pradesh and Karnataka.

(e) *Subsidy to the Rural Sector* As explained in section II, we have constructed three different estimates of the share of subsidy accruing to the rural sector according to three alternative definitions. The estimates are presented in Table 12. In the aggregate, the subsidy accruing to the rural sector amounted to Rs 15,713 crore according to the narrowest definition and Rs 16,363 crore according to the broadest definition. This formed about 60 to 62 per cent of the total bill of subsidies in the States. Substantial inter-State differences were also seen in subsidies per rural person ranging from about Rs 213 in Uttar Pradesh in all alternatives to over Rs 525 or Rs 513 in Haryana, depending upon which definition was considered.

The point to note, however, is that even if we take the broadest definition, the share of subsidies accruing to rural areas was

all these cases the disadvantaged seem to be getting less than their proportionate share of subsidies.

In every State except Haryana where the two shares are more or less equivalent. In the aggregate, whereas the share of rural population was over 76 per cent, the share of subsidies accruing to the rural sector was just about 62 per cent. The maximum difference was in Punjab where the subsidy share was lower than the population share by over 25 percentage points. Very large difference in the shares was seen also in Orissa, Tamil Nadu, Kerala, Uttar Pradesh, Maharashtra and West Bengal. It may be noted that these only indicate a broad pattern of subsidies accruing to the rural sector. In order to arrive at firm conclusions, however, a detailed analysis of the incidence of subsidy would have to be undertaken, which is not attempted in this study.

IV

Concluding Remarks

In this paper an attempt has been made to estimate the total volume and composition of government subsidies in India in the year 1987-88, after costing government services on a user charge basis. The exercise shows that the actual volume of subsidies was huge, amounting to Rs 42,324 crore or almost 15 per cent of the GDP.

Pure transfer payments are transparent and their beneficiaries are explicitly targeted. Unfortunately, such direct transfer payments are still relatively small in India. By comparison the total volume of subsidies in 1987-88 was more than ten times as large and it turns out that the bulk of this subsidy was not visible. The explicit subsidy, as revealed in budgets for 1987-88, amounted to only Rs 5,982 crore. Even by the broader National Accounts definition, the volume of visible subsidy worked out to only Rs 11,795 crore or about 28 per cent of the actual volume of subsidies.

There can, of course, be differences in judgment about whether or not a part of this includes expenditure on pure public services, on what should be the correct interest rate or the appropriate depreciation rate and so forth. But none of this can detract from the essential fact that a substantial proportion of the GDP is being distributed in the form of subsidies through the budget, much of it invisible, and that it is not at all clear that these subsidies are flowing to intended beneficiaries.

We have attempted to make this phenomenon transparent by quantifying the flow of these subsidies, even if only as a first approximation. The resulting estimates show not only that the total volume of subsidies is very large but also that it is inequitably distributed. This is the picture which comes through if we look either at the distribution of social services between socially disadvantaged groups and others or the inter-regional allocation of subsidies per capita between high and low income States or the inter-sectoral allocation of subsidies between the rural sector, where per capita incomes are

all these cases the disadvantaged seem to be getting less than their proportionate share of subsidies.

Admittedly, this in itself cannot be taken as conclusive evidence that the overall fiscal system is regressive. For that the incidence of taxation and expenditure and the other indirect effects of fiscal policy must also be taken into account. But clearly, where subsidies are concerned, it is necessary to reform them in a more egalitarian direction. Our estimates show that with greater transparency and better targeting it should be possible to significantly increase the flow of services as well as subsidies to disadvantaged groups without any increase, perhaps even with a reduction, in the total bill of subsidies. This can be done provided the leakage to unintended beneficiaries is plugged. This particular implication is of immediate relevance in the context of the fiscal imbalance and negotiations with the International Monetary Fund which are likely to lead to a major fiscal squeeze from the next financial year. Careful advance planning is necessary if we are to protect those who are already vulnerable from bearing the further costs of adjustment.

We must also reconsider in this context the issue of budgetary support to public enterprises. Our estimates show that over 35 per cent of government subsidies have been flowing to these enterprises. Given externalities and missing markets, there is no question that public enterprises must play a major role in any programme of industrialisation. However it is worth asking whether, even after 40 years of protected domination of the commanding heights of the economy, these enterprises should still remain dependent on budgetary support. Even if they are not immediately able to pay back to government an adequate return on its investments, surely they should at least pay their own way, especially when the opportunity cost of budgetary support to these enterprises may have to be measured in terms of forgone wages for unemployed agricultural labourers in government employment programmes.

Notes

8 During the Seventh Plan, for example, the States' actual plan expenditure (Rs 74,519 crore) was lower than the planned outlay by about 8 per cent. This shortfall was largely due to below target budgetary contributions. It may also be noted that during the eighties the severe resource constraint has caused a substantial deceleration in the growth of capital expenditures at the State level. On this see, Rao, M G, and Tulasidhar, V B, *Public Expenditure in India—Emerging Trends*, NIPFP (Mimeo), 1991.

9 In some federations, 'average' level is taken as the 'standard' level. For the shortcomings in the design of general purpose transfers in India, see, Rao, M G and Aggarwal, V, 'Central Transfers to Offset Fiscal Disadvantages of States. Measurement of Cost Disabilities and Expenditures Needs', *Indian Economic Review* (forthcoming).

10 This excludes a small element (about Rs 100 crore) of subsidy on account of adult education, which really qualifies as primary since this item largely consists of a basic literacy programme for illiterate adults.

11 This is partly due to the higher recovery from the activity of selling text books at secondary education level in some States.

Probing the Jharkhand Question

Arunabha Ghosh

A close study of the nature and growth of the Jharkhand movement brings to light four basic issues which have been instrumental in mobilising the otherwise peace-loving tribal people of the region to raise their voice of protest against subordination and injustice—land and forest alienation, immigration, cultural identity and underdevelopment.

JHARKHAND, the land of forests, variously called as 'Nagadesh' and 'Dasharanya' in different periods of history and often described as the 'Ruhr of India', has time and again, given rise to various social and political groups, championing the cause of the local people against the exploitation by the outsiders. During the last decade or so, such protests have assumed a much more organised form and consequently, have gained in political significance, demanding more attention from researchers.

I

Brief History

Perhaps the earliest settlers in this central tribal belt were the 'Asurs', whose occupation was iron smelting and the 'Saraks' or Jain Shrivakas.¹ They were followed by the Mundas with their language family the Kharias, the Hos and the Santhals around 500 BC. The Nagbanshis (Nag community) arrived during the first century AD while the Dravida-speaking Oraons came even later.

Socio-economic exploitation of these 'original inhabitants', in the form of land alienation and indebtedness, started along with steady flow of immigrants during the reign of the fourth Nagbanshi King Pratap Rai in the fourth century AD.² During the Muslim period brave, chivalrous and scholarly people as well as priests were invited from distant places to serve the region in their various capacities. Refugees and military invaders also came and settled down in the region from time to time. These 'diku' (outsider) immigrants not only infiltrated tribal territory but also into their life and culture. The influx of immigrants which continued till the Mughal era, upsetting the demographic pattern of the region, however, did not result in any major protest from the aborigines at that time.

Around the sixth century AD the Mundas and Oraons jointly selected a 'manki' (leader) who was not the sovereign of the land but had to play a prominent role during wars.³ A descendant of this 'manki' was later made a tributary of the Mughals and by 1585 the Chotanagpur Raj was virtually annexed by the Mughals. Another 'manki' Durjansal was imprisoned by the Mughals for his failure to pay tributes in time and on his return from the Gwalior jail in 1680 he surrounded himself with Hindu courtiers and mercenaries whom he made 'jagirdars' of Munda and Oraon villages with the right to collect and enjoy taxes from those villages.⁴ The immigrant 'jagirdars' and 'thikadars' in course of time, introduced land rent in the Chotanagpur region and gradually ousted many of the original inhabitants of the land for their inability to

pay rent or reluctance to render 'begar' or forced labour to the new masters. Thus, the transfer of ancestral tribal lands to outsiders began as early as the 17th century reducing the tribal peasants to mere cultivators of land, paying rent to the non-tribal 'diku' landlords, who in turn paid a share to the Maharaja of Chotanagpur, who then paid a share to the Mughal emperor.

By the middle of the 18th century, the communitarian 'adivasi' society began to lose its own distinctive qualities under the influence of a larger Hindu society. Its disintegration was expedited by the introduction of social division of labour in the form of the caste system.⁵ Pressure of immigrant Rajputs, Brahmans and other high caste Hindus and the exploitation by these newly emerging mahajans, thikadars and zamindars, completely shattered the 'adivasi' economy.

In 1771, Jharkhand came under the jurisdiction of the East India Company. The company initially subordinated the Maharaja of Chotanagpur almost in the same way as did the Mughals. But as they were actually interested in revenues from the land, they introduced a permanent legal and administrative structure to ensure regular and smooth collection of revenue. British administrators gradually introduced money economy, individual ownership of land and a police system to control tribal uprisings. The traditional right of tribals over land and forests as well as the age-old panchayat systems thus slowly gave way to the forces of modernisation.

The Permanent Settlement Act of Lord Cornwallis in 1793 legalised the individual proprietorship in land and led to further alienation of tribal lands. Besides, indiscriminate destruction of forests and unplanned mining in the region pauperised the tribals. The 'adivasi' population, thus divested of all possible means of production, were gradually transformed into a vast army of 'coolie' labour.

Almost all the 'rajas' of the Jharkhand region accepted British supremacy and started paying rents to the crown by the end of the 18th century. Thus the whole administrative machinery of the 'former 'raja' became a useful instrument in the hands of the alien rulers to exploit the indigenous people. By the beginning of the 19th century, Chotanagpur came under a four-tier system of administration.⁶ The East India Company was at the top of the ladder, followed by the maharaja of Chotanagpur, then a number of local 'rajas', mostly of non-tribal origin and finally the 'thikadars', appointed by the 'rajas', to collect rent directly from the peasants.

II

Tribal Protest during 19th Century

Periodic tribal uprisings against the 'diku' exploiters marked the history of the region throughout the 19th century. Christoph Von Furer-Haimendorf, an anthropologist specialising on Indian tribes, observed that "anyone with first-hand experience of conditions in areas where aboriginals are subject to exploitation by more advanced populations must be surprised not by the occurrence of uprisings, but rather by the infrequency of violent action on the part of aboriginals deprived of the ancestral lands and the freedom they enjoyed before their contact with populations superior in economic and political power".⁷

In 1798-99, the Bhumi of Manbhum and all other tribal communities, including the Kurmis of Jharkhand, joined hands to fight against the oppression and exploitation let loose by the 'diku' migrants and the British. The effort to drive away their common enemies from their homeland sometimes took violent forms of looting and arson, particularly in the Bankura and Midnapur regions. The British described this expression of tribal consciousness as anti-social and anti-status quo and to discredit this uprising gave it a derogatory name, 'Chuar' rebellion.⁸

The famous 'Kol Vigulan' (rebellion) took place during 1831-32. It was led by Snighray and Binray Manki, against the 'diku thikadars'. The British administration, under the East India Company, defended the rent collecting 'thikadars', under attack, even with the help of troops under the company. The Mundas, Hos, Bhunyas and Oraons of the Chotanagpur region, joined hands to fight against the double oppression of the 'diku-British' alliance. The armed rebellion was against the oppressive system perpetuated by the non-tribal 'zamindars', traders, contractors, police and moneylenders. Though it was primarily against the land alienation, bonded labour and loss of honour of the tribals, it was also a protest against the ideological and cultural domination over them.⁹

The 'Santhal Hul' (rebellion) led by Sido and Kanhu in 1855, was a violent expression of the simmering discontent and tension among the Santhals against the exploitation by the non-tribal 'mahajans', 'zamindars' and British merchants. The Santhals claimed the right to the lands which they used to cultivate. In many areas people were organised on the pattern of private armies, equipped with bows, arrows and battle axes. Several cases of arson, looting and even killing of 'mahajans' were reported. Govern-

rebellion as the local administration proved to be inadequate for the purpose.

McPherson opines that apart from the oppression of the 'mahajans' and landlords, a deeper sense of freedom—"Santhal yearning for independence, a dream of the ancient days when they had no overlords, perhaps a memory of prehistoric times when they were themselves masters of the Chotanagpur valley and had not yet been driven back by the Aryan invaders"—was instrumental in giving rise to the uprising.¹⁰ The movement, though it had an apparent ethnic bias, was not confined to the Santhals alone. Though the Santhals provided the leadership, even the indigenous artisan castes like the Kumars (potters), the Jelis (oilmen), the Kamars (blacksmiths), the Cowals (milkmen) as well as the Momins (Mohammedan weavers), all of whom had developed close relationship with the Santhals through the ages, were intimately connected with the movement against the tyranny of outsiders.¹¹ Thus, it had developed almost a class character in its organisation and objectives rising above narrow ethnic sentiments.

The experience of the "Santhal Hul" made the Santhals realise that such violent uprisings alone were perhaps not enough to improve their economic status and to end exploitation by the 'dikus'. The result was a Hinduised social reform movement called the 'Kherwar' movement which began to spread among the Santhals during the early seventies. The term 'Kherwar' represented the memory of their golden past when the Santhals, free from outside interference, were their own masters and were known as 'Kherwars'. This movement was more socio-religious than political in nature and adopted many Hindu symbols to mobilise the masses.

Thus, while the "Santhal Hul" drove the Santhals away from the Hindus through its contra acculturative tendencies, the Kherwar movement, on the other hand, encouraged greater acculturation.¹² That, however, could not overcome the psychological barrier between these two communities. The Santhals retained their ambivalent attitude towards the 'dikus' as before, admiring their intelligence but hating their superiority complex as well as their exploitative tendencies.

Another anti diku agitation took shape during 1875-95,¹³ known as the 'Sardar Larai' (Leaders' war) to establish the right of tribal peasants over land by driving away alien landlords. Both the Mundas and Oraons joined the movement initially, but later in the mid eighties the Oraons broke away. 'Sardars' were the leaders of different tribal communities at the local and regional levels. They led the tribals to fight for their land and forest rights, their social and cultural identity and religious purity. It was a movement against the 'dikus', the British as well as the Christian missionaries.

At Nava Katan (1881) the Mundas and Oraons rallied around John the Baptist in 1881, to wipe out corruption and all sorts of exploitation relating to tribal lands. A corporate self consciousness was gradually developed during the course of the movement. Thus a group of tribal leaders—sar-

ganised manner. Not only did they take up arms but also took recourse to law to protect their rights and privileges.¹⁴

The Birsa Munda uprising of 1895-1900, was primarily directed against the British and the non tribal landowners. It aimed at establishing a 'Birsait Raj', with Birsa as its 'new king', after driving away all the foreigners, not only the British but even the Hindus and Muslims, from the region. The question of alienation of land was the main driving force of the uprising. Birsa fought on economic, social, political and religious fronts. Land, forest, people and religion were the key issues in this uprising. Economic exploitation in the form of land and forest alienation, social exploitation in the form of torture of tribal women and religious exploitation through the conversion of tribals to Christianity were countered. His strategies were primarily non-cooperation but he was not against direct confrontation if needed. The British tried to crush the uprising at gun point because of its potential threat to their domination.

Birsa was a reformist and a revivalist too. He became a critic of traditional tribal customs, religious beliefs and practices. He thus called upon the Mundas to fight against superstition, give up animal sacrifice, stop taking intoxicants, to wear the sacred thread and retain tribal traditions of worshipping in the 'sarna' or sacred grove (not in the temples) of the village.¹⁵ Gradually Birsa gained the stature of 'Birsa Bhagwan' in the eyes of the long exploited Mundas. With his death the movement dissipated but Birsa himself became a folk hero. The agrarian revolt spearheaded by him was successful in the sense that the British henceforth, tried to prevent or at least to minimise the loss of tribal land to the non tribal 'dikus'.

The 'Tana Bhagat' movement was organised under the leadership of Jatra Oraon around the year 1914, with a promise of millennial era of Oraon rule, free from foreign settlers on their land.¹⁶ It was an ethnic, revivalist movement among the Oraons, which called for 'purity of life'. The leaders launched a non violent agitation against the 'diku' landowners. The basic argument of the movement was that land was the gift of god and no one had the right to interfere with the tribals' right to land. Jatra Bhagat's followers came in contact with Mahatma Gandhi and joined the non-cooperation movement against the British. Jatra also denounced the traditional Oraon religious practices and asked his followers to practise 'purity of behaviour'. The movement was, however, less pervasive and less violent in comparison with other political agitations of the mid and late nineteenth century.

III

Evolution of Jharkhand Movement

All these movements up to the 20th century basically centred around the issue of exploitation and deprivation of the indigenous people by the migrants and the ruling elite. The overall pattern of these 'messianic movements' began to change under

roughly around the beginning of this century. The death of Birsa Munda in 1900, marked the end of 'traditional religious type' of leadership and was replaced by a 'rationalistic type' of leadership, whereby the new leaders started relying mostly on education and experience gained through contacts with modern civilisation.

At the turn of the present century, quite a number of institutions, led by Christian missionaries and students emerged to introduce social reforms and develop the tribal life in general. Such movements were designed to check the drinking habit among the tribals and to rescue them from the clutches of moneylenders by forming co-operative societies. One such society, the 'Roman Catholic Co-operative Society', was formed in 1906 and played a significant role in raising the standard of tribal life in the region.¹⁸

There were also societies for the promotion of education among the tribals which provided the nucleus for the latter political movements. One such society viz, the 'Christian Association' was formed by the Lutheran graduates in 1898 and was renamed the 'Christian College Union' in 1918 after the Catholics joined it.

The first students' organisation in the country 'Bihari Students' Conference', composed of students belonging to various tribes, was established by Rajendra Prasad in Patna and a 'Christian Students' Conference was convened at Hazaribagh in the year 1910.¹⁹ The Christian 'adivasi' students were initially guided by some philanthropic ideas, but soon they became concerned about the socio-economic uplift of the tribals. The first organisation for the said purpose, in the form of a movement, was organised by the Lutheran Christians and F. Bartholomew, a student of St. Columba's College, Hazaribagh organised the Christian students to form a society called 'Chotanagpur Unnati Samaj' in 1915.²⁰ It was primarily a welfare organisation, aimed at the development of the Chotanagpur area by improving the social, economic and political conditions of the tribals. Though not a political organisation, the samaj held regular meetings, panchayats, etc. It opened its gate to non-Christian 'adivasis' as well and worked for inter-tribal unity by bringing into its fold a large number of educated youth. However, it was basically an urban, elitist organisation with very little influence in the villages. The leadership was provided by the teachers and catechists, who demanded employment opportunities for the educated tribals, sought to secure reservations for them in different services and legislative bodies and planned to form a sub-state of Chotanagpur joined either to Bengal or Orissa but certainly detached from Bihar.²¹

The Simon Commission arrived in India in 1928.²² The members of the Chotanagpur Unnati Samaj, led by Bishop Van Hoeck and Joel Lakra, took the opportunity to place a memorandum before the commission seeking special privileges for the tribals and urging the commission to consider the demand for a separate administrative unit

in the Chotanagpur region.²⁴ The effort, however, did not meet with success.

The desire to overcome the urban Christian orientation of the movement was evident in the formation of a 'Kisan Sabha' in 1931, under the leadership of Theble Oraon, a non-Christian, who along with Lorentius Burla, left the Unnati Samaj to organise the Sabha. The Kisan Sabha, however, did not attain any significant success, as its programmes, suitable for Gangetic Bihar, was not that effective in Chotanagpur and Santhal Parganas regulated as they were by special tenancy acts.²⁵

In the government of India Act 1935, Chotanagpur was described as a 'partially excluded area' and was put under the special responsibility of the governor under section 92 of the act. The Chotanagpur Unnati Samaj opposed the provision through a number of resolutions and held quite a few meetings, without much success, as the government stood firm about the provision. However, when elections were held in January 1937 in accordance with the provisions of the new act, all the candidates fielded by the Unnati Samaj and the Kisan Sabha were defeated, as the Congress swept the polls. Only the 'Chotanagpur Catholic Sabha', formed in 1936, under the leadership of Boniface Lakra as the president and Ignes Beck as the secretary, was able to win two seats in the region.²⁶

Electoral reverses of the tribal candidates in the 1937 elections led to a change in the attitude of the tribal leaders and an attempt was made to bridge the gap between the Christians and non-Christians among the tribes. The result was the formation of 'Adivasi Mahasabha' in 1938, a monolithic organisation to which the Unnati Samaj and the Kisan Sabha were merged. In spite of its name, Adivasi Mahasabha did allow the non adivasis of the region to participate in its activities, at least officially. The Bengalis who considered themselves unsafe in Bihar and the Muslim League, planning to build a corridor linking the east and west wings of Pakistan, also provided moral and material support to the Mahasabha.

The Mahasabha, which worked for the creation of a separate state (not a 'sub-state' as was planned by the Unnati Samaj), demanding complete separation from Bihar, was led by some highly educated professional leaders. Prominent among the leaders was Jaipal Singh, an Oxford-returned Christian tribal, who was not only highly educated but had successfully captained the Indian hockey team to victory in the 1928 Olympics at Amsterdam. Jaipal, with charismatic qualities, came to be known as 'morang gomkey' (supreme leader) of the Jharkhandis. He presided over the second session of the Mahasabha in 1939 and gave a call for the creation of a separate province for the tribals. He also demanded an enquiry into the malpractices of the Congress ministry in Bihar.²⁷ Later, during the second world war, when the Congress ministry in Bihar resigned on October 31, 1939, Jaipal Singh, a loyalist, supported the British government and its war efforts and helped them to recruit tribals for the British army.²⁸

The Adivasi Mahasabha was not initially a political party and more or less remained outside the mainstream of nationalist politics. It sought representation in the Bihar Pradesh Congress Committee but did not get it.²⁹ Subsequently, it contested the 1946 general elections on its own and was routed by the Congress at the polls. The defeat was largely because of the emergence of 'Adim Jati Seva Mandal', a social reform organisation, formed by Rajendra Prasad, to conduct welfare activities among the tribals and 'Sanatan Adivasi Mahasabha', founded by Theble Oraon, as a counterpoise to the Adivasi Mahasabha.³⁰ The link between the Muslim League and the Adivasi Mahasabha was also broken in 1947 and the riots in Calcutta and the partition of Bengal shook the Bengalis living in Bihar a great deal. As a result the controversies between Biharis and Bengalis lost its momentum, at least temporarily.

Adim Jati Seva Mandal was a voluntary organisation financed by the government, with the objective of weakening the movement led by the Christian tribals for a separate Jharkhand state.³¹ It provided free education and medical aid to the tribals to bring them out of the missionary influence. Gradually, the Seva Mandal came to be identified with the Hindus and a convert-non-convert division among the tribals followed, affecting the cause of the Jharkhand movement adversely.³²

PARTY-BASED MOVEMENT

Justin Richard, a tribal leader, organised the United Jharkhand Party late in 1948.³³ The party was open to both the tribals and non-tribals. Jaipal Singh joined the new organisation after some initial hesitation. On March 5, 1949, at a conference of the Adivasi Mahasabha, held at Hindisala in Ranchi, 'Jharkhand Party' was formed, with Jaipal Singh as its president and Idsen Deba as the secretary, winding up the Adivasi Mahasabha.³⁴ Jaipal did not hesitate to arouse primordial loyalties of the tribals and used violent means to put an end to north Bihar dominance in the region.

In the initial years, the Jharkhand Party showed four distinct traits: (a) urban orientation in thinking and activity, (b) Christian domination and close links with the churches, (c) predominance of Mundas and Oraons—the two major tribes of Ranchi area, and (d) sectarian behaviour against non-tribal population in the name of tribal solidarity.³⁵ However, ethnicity was gradually replaced by regionalism as the rallying point for the Jharkhand Party and the militant movement gave rise to an organised political party. This was partly because of the recognition of the tribals' need for special protection under the Constitution of free India and provisions inserted under the Fifth and Sixth Schedules for their emancipation. The Jharkhand leaders were probably also influenced by the stand taken by the Congress Party that language, not ethnicity, should determine the formation of a province. Many elements of the Congress Socialist Party and quite a few members of the moneylending community,

identified as 'dikus', joined the Jharkhand Party during this period. The area of Jharkhand was enlarged to include lands inhabited by the Chotanagpur tribals but falling under West Bengal, Orissa and Madhya Pradesh. Thus, a new phase of constitutional participation based on regional sentiments dawned.

In the first general elections of 1952, the Jharkhand Party fought the elections with the call for an 'Alag Prant' (separate land) and became the largest opposition party in the Bihar legislative assembly, by winning all the 32 seats from south Bihar.³⁶ The party won 33 assembly seats in all, out of a total of 325 seats and three Lok Sabha seats from Bihar alone. Jaipal Singh himself became an MP. This electoral victory gave new impetus to the movement in and outside the assembly.

The States Reorganisation Commission was formed in 1953, with Fazle Ali as its chairman. With the formation of the commission, the Jharkhand Party submitted a memorandum 'On the Question of the Formation of the State of Jharkhand within the Indian Union'. The memorandum, signed by 34 members of the Bihar legislative assembly, was submitted on April 22, 1954. It demanded formation of the state of Jharkhand, comprising the districts of Chotanagpur, Santhal Parganas and parts of Gaya, Shahabad, Bhagalpur and Monghyr districts of Bihar, some 'tehsils' of the Mirzapur district of UP, Surguja district of Madhya Pradesh and districts of Keonjhar and Mayurbhanj in Orissa. The proposed State, according to the memorandum, was to comprise of an area of 63,859 square miles with a population of 1,63,67,177, which was bigger than West Bengal in area and Orissa in population.³⁷

K M Panikkar and H N Kunzru, two members of the States Reorganisation Commission, visited Chotanagpur region from January 27 to February 10, 1955 and faced impressive demonstrations by the members of the Jharkhand Party. The commission, however, in its report did not agree with the idea of a separate Jharkhand state. Some of the members of the commission even supported the claims of Orissa over Seraikela and Kharsawan and almost 2,407 square miles of the proposed Jharkhand state was given to West Bengal. The main reason sighted by the commission for not granting a separate statehood to the Chotanagpur plateau was the lack of viability of the region as a linguistic unit.³⁸ The tribals were shocked, but despite their disappointment, the Jharkhand Party continued to be the leading opposition party in the Bihar legislative assembly. In the general elections of 1957, its strength, however, was marginally reduced to 28 seats.

Between 1955 and 1961, a number of anti-moneylender agrarian struggles, led by the Santhal activists of the Jharkhand Party, took place in Santhal Parganas. Prominent among the leaders was Satrugna Besra, an MLA from Jamatara. Interestingly, the Jharkhand movement among the Santhals, unlike that among the Mundas and Oraons, was always oriented towards the agrarian cause.³⁹ The centre of activity during these

struggles was shifted from Ranchi to Santhal Parganas, the home of the Santhals.

However, in the 1962 general elections, the strength of the Jharkhand Party in Bihar legislative assembly was substantially reduced to only 20. This was largely because of a Christian-non-Christian schism among the tribals, weakening the party. The division was caused by the advantages enjoyed by the educated and missionary-backed Christians in getting jobs and other social benefits *vis-a-vis* the non-Christians. The developmental activities and industrialisation under the first two five-year plans in the Chotanagpur region and the participation of the tribal people in those programmes, also removed them from the agitational path, at least temporarily. Besides, experiments in Madhya Pradesh and Orissa, where tribals were represented in the council of ministers of the Congress government, amply proved that sharing of power even with the Congress could protect tribal interests up to a certain level. In the meantime, some new States had also come into being as a result of movements launched from within the Congress. Jharkhand leaders felt that they could perhaps serve the tribals' interest better from within the ruling Congress Party. Jaipal Singh, facing severe criticism for his dictatorial attitude, also sought refuge under the Congress umbrella. Thus, the Jharkhand Party merged with the Congress in June 1963, surrendering the popular party symbol of 'cock' and its legal identity altogether.

ERA OF CONFUSION

The merger dealt a severe blow to the movement and ushered in an era of confusion in the politics of Chotanagpur region. Jaipal was included in the Bihar cabinet led by Pandit Binodamanda Jha, who saw this as an opportunity to penetrate into the tribal belt, so far eluding the Congress influence. However, in August 1963, Jha had to resign as chief minister, under the Kamraj Plan and his successor K B Sahay relieved Jaipal of his post of education minister and appointed S K Bage as a minister.³⁸ Not only was Jaipal Singh dislodged from his ministership in the Bihar cabinet, but most of his followers, particularly the senior ones, turned against him. They declared the merger to be illegal and started reviving the old party. The party spirit though revived was fragmented and lapsed back to its ethnic character.³⁹

During the fourth general elections of 1967, an anti-Congress wave was evident in the Chotanagpur plateau. Tribal leaders in the Congress, with a Jharkhand background, fared badly. Jaipal Singh scraped through with a very narrow margin, while S K Bage, a minister in the Bihar cabinet, forfeited his deposit. Though the symbol of 'cock', allotted to the Jharkhand Party, was frozen, those opposed to the merger fought as independents and succeeded in winning eleven seats in total.

After this election, Bihar passed through a period of political instability and there were experiments in coalition governments from 1967 to 1972. Lack of any unified

political group of the tribals further added to the confusion. A number of splinter groups like 'Birsas Seva Dal', 'Veer Birsas Dal', 'Krantikari Mukti Morcha', 'Chotanagpur Plateau Praja Parishad', 'Adivasi Chhatra Parishad', 'Chotanagpur Front' and others claiming to be the real Jharkhand Party appeared on the scene.⁴⁰ None of these groups, backed by Christian organisations overtly or covertly, could, however, further the cause of the suffering tribals as they were infected by mutual bickerings. Thus, unprecedented factionalism marked the post-Jaipal period of the movement.

By this time, Kartick Oraon, a Hindu version of Jaipal Singh, with Western education and experience, emerged as a reaction against the Christian domination of the tribal scene. He was against the special privileges enjoyed by the Christian tribals under the Constitution of India, as the Christians were in a better position *vis-a-vis* the non-Christians in educational and other fields. In November 1968, Oraon appealed to the A K Chanda Committee, visiting Ranchi, to divert the money spent on Christian tribals to the welfare of the backward non-Christian tribals.⁴¹ Soon Kartick Oraon was rewarded with the vice-chairmanship of the Chotanagpur and Santhal Parganas Development Authority, located at Ranchi. He also won parliamentary elections of 1967 and 1971. By this time, the Bihar Scheduled Areas Regulation Act of 1969 put restrictions on the alienation of tribal land to non-tribals and provided for their restoration. This was an important legislation in preventing further loss of tribal land to the outsiders and in restoring the confidence of the original inhabitants.

On May 19, 1968, David Munzani organised the 'All India Jharkhand Party'⁴² which was dominated by Christians and naturally could not resolve the Christian-non-Christian rift. Bagun Sumbrai was named president and N E Horo, the general secretary of the party. The party was soon divided into Bagun faction and Horo faction. In the mid-term poll of Bihar in 1969, the Horo faction of the All India Jharkhand Party secured ten seats in the assembly. But in the 1972 general elections for the Bihar State assembly, it managed only one seat as against four of the Bagun faction. As a result of this dissension within the party, N E Horo left the organisation and formed a new party known as 'Jharkhand Party'.⁴³ On March 12, 1973, Horo submitted a memorandum to the prime minister Indira Gandhi, demanding the creation of a separate state of Jharkhand. This was actually a modified version of the demand placed before the States Reorganisation Commission in 1954 by Jaipal Singh.

In 1968, Justin Richard established yet another party in Santhal Parganas, namely, 'Hul Jharkhand' named after the Hul (revolution) of 1855-56.⁴⁴ The party got seven seats in the mid-term poll of Bihar in 1969. It sought to project a non-ethnic, non-parochial image by appointing non-Santhal members in its executive committees, at the central level. Christian and non-Christian (including both Hindus and Muslims) Santhals as well as representatives from Ranchi

and Singhbhum districts were taken in the committees.

Another radical group, 'Birsas Seva Dal' was quite active during 1967-69, especially in the urban areas of Ranchi and Jamshedpur. Named after the tribal hero Birsas Munda, the Dal was founded by Lalit Kuzur and had Moses Guria as its general secretary. It embraced socialism as its basic economic goal, boycotted the elections and thus, gave a new direction to the movement.⁴⁵ The Dal organised violent attacks on non-tribal landlords and led mass demonstrations in the urban areas, clamouring for a tribal state. Kuzur believed in 'detribalisation', doing away with their primitive way of living and preferred to call the adivasis or tribals 'Chotanagpuri' as both the terms were considered to be 'hateful' words.⁴⁶

Almost during the same period a social reform organisation, namely 'Sivaji Samaj', appeared in 1969 under the initiative of Sibusoren to fight the evils of liquor, money-lending, etc.⁴⁷ He was soon joined by Binod Behari Mahato and A K Roy, who after being expelled from the Communist Party of India (Marxist), had formed the Marxist Co-ordination Committee. Sivaji Samaj soon took the shape of a movement and spread over a large area of 'Jharkhand', including parts of Purulia district in West Bengal. The movement reached even remote villages, fought against the exploitation of landlords and started 'Dhan Kato Andolan' (forcible harvesting).⁴⁸ 'Gram Golas' (collective grain storages) were established to help the poor tribals at the time of crisis. Such measures made the movement very popular among the tribals and mobilised a large section of the landless tribals around the Samaj.

RADICALISATION OF MOVEMENT

Sivaji Samaj was gradually transformed into 'Jharkhand Mukti Morcha', with Binod Behari Mahato as its president and Sibusoren as its general secretary.⁴⁹ The Marxist Co-ordination Committee of A K Roy also lent able support to the Morcha. Some of the Naxalite groups operating in the Dhanbad area also provided moral support to the movement. Thus, radicalism found a new expression under the banner of Jharkhand Mukti Morcha and the movement got transformed significantly on many counts.

The Morcha projected itself as a radical Marxist party, fighting against 'internal colonial exploitation' of the Chotanagpur region. Naturally, it not only demanded a separate state, but a state free from class exploitation. The leaders promised to make Jharkhand the first 'Lalkhand' (red state) in India.⁵⁰ JMM decided to recover alienated lands from moneylenders and big peasants in North Chotanagpur, an area where Jharkhand Party was not very strong. More than hundred cases of 'land riots' and violent clashes between the tribals and the 'mahajans' were reported from the region. The agrarian radicalism of the JMM was combined with its interest in cultural revivalism. The ancient practice of 'tribal self-government' was partially revived. The 'baisi' (assembly) was revived in Santhal

Parganas, without pleaders or court fees, to deliver simple justice to the local people. Traditional collective farming on common lands was reintroduced in some areas.⁵¹

The JMM also widened its base, at least in Dhanbad, by embracing the mining and industrial workers, most of whom came from the neighbouring States. Thus, an attempt was made to bring the workers and peasants closer on a common platform. Thus far the movement, before the advent of JMM, was basically an 'Adivasi Movement', with non-tribal population being lukewarm in their response to the cause of the movement. The Morcha, for the first time, could project some non-tribal leaders like Binod Behari Mahato, A K Roy, K S Chatterji and others with considerable mass base and thus could shed its exclusively tribal character to some extent.

The protagonists of the separate Jharkhand State kept a low profile during the JP movement in 1974. Though Jayaprakash Narayan himself was in favour of creating smaller States in India.⁵² The general elections of 1977, held after the Emergency, ushered in the Janata rule both at the Centre and the State of Bihar and saw a virtual rout of the regional forces in the Chotanagpur region. Only A K Roy of the Marxist Co-ordination Committee was returned from Dhanbad. What was worse, Bagun Sumbrui, of the All India Jharkhand Party, joined the Janata Party, leaving N E Horo alone to keep the Jharkhand flag flying.⁵³

During the Janata rule in Bihar, interestingly, all the political parties, including the Congress, created their own Jharkhand cell to appeal to the pro-Jharkhand sentiment of the tribals.⁵⁴ The otherwise dead political movement started gaining ground again since 1978. Sibui Soren, by this time, emerged as a true mass leader in Dhanbad and Santhal Parganas. During 1978-80 he organised violent rallies and mass demonstrations against moneylenders, big landholders and 'mafia' leaders. The 'Jungle Bachao (save forest) Andolan', centring around the forest areas of Singbhum, also gained ground during this time.⁵⁵

In January 1980, during the seventh general elections for the Lok Sabha, Congress formed an alliance with Sibui Soren, the charismatic JMM leader, to gain ground in the tribal belt of Chotanagpur. The pattern was followed in the subsequent State assembly elections held in June, the same year. The return of the Congress to power, both at the Centre as well as in the State of Bihar, signalled a virtual end to the militancy of Sibui Soren, who gradually distanced himself from Binod Behari Mahato and A K Roy. Meanwhile, Bagun Sumbrui, another important leader of the 'Ho' faction, with considerable influence in the Singbhum region, also joined the Congress Party. By this time the Chotanagpur and Santhal Pargana Development Authority was formed in 1981, under the initiative of Kartick Oraon.⁵⁶ The authority, intended to reinforce the developmental process in the area, however, failed to implement its resolutions effectively. Kartick Oraon, like both Soren and Sumbrui, also thought of fighting for the tribals' cause from within the system and

preferred to join hands with the Congress. Thus, the Jharkhand movement reverted back to its infancy, with the dream of a separate Jharkhand State enjoying little practical value.

In May 1980, a department of tribal and regional languages was opened in the Ranchi University. B P Kesri, vice-president of the All India Jharkhand Party, Horo faction and a teacher of Hindi in the GLA College, Daltonganj, joined the department. In June 1980, A K Dhan, a Western educated Christian tribal, who was serving in the North-Eastern Hill University, Shillong (and was offered the post of treasurer of the Jharkhand Co-ordination Committee, after it was formed in 1987) was appointed as vice-chancellor of the university. Soon the university, especially its tribal and regional languages department, became the nerve centre of tribal activities. Missionary agencies like Bishop Carey Institute, Bangalore and Oxfam, banned in West Bengal, provided finances for publications and other activities of the department.⁵⁷ Dhan himself patronised missionary institutions like St Augustine College, Manoharpur; Albert Ekka College, Chainpur; St Paul's College, Ranchi and B Ed Colleges at Lohardaga and Jamshedpur run by the Christians.

In 1982, quite a number of educated tribals got appointments as lecturers and principals in different colleges of the region. Higher posts in the university administration, like that of registrar and deputy registrar, director of physical education, etc, were also filled up by tribal candidates.⁵⁸ The student hostels of the university were virtually converted into adivasi hostels, providing shelters to the tribal politicians and agitators. During a visit of Chandra Sekhar Singh, the then chief minister of Bihar, to Dumka in 1983, raids were conducted on adivasi hostels and as a result, a number of arms were recovered and large number of activists were arrested.⁵⁹

Thus, Ranchi University and its department of tribal and regional languages became a training centre for activists working under a number of front organisations of the tribals like 'Chotanagpur Santhal Parganas Sangharsh Vahini', 'Chotanagpuri Intellectual Forum', 'Chotanagpuri Teachers' Association', etc. A large number of cadres were also supplied to the All Jharkhand Students Union after its formation in June, 1986.

In the eighth Lok Sabha elections held in 1984, Sibui Soren lost along with A K Roy and in the subsequent assembly elections of 1985, JMM won 14 seats, thus becoming a major opposition party in the Bihar legislature. In 1985, 52 members of the Bihar legislative assembly, representing the Chotanagpur region, under the leadership of Devendra Nath Champia, sent a joint memorandum to the prime minister demanding Central administration in the Chotanagpur region.⁶⁰

Meanwhile, the tribal students formed the All Jharkhand Students' Union on June 22, 1986 taking a cue from their counterparts in Assam. Prabhakar Tirkey, a student of Birsa Agriculture University, Ranchi, became the president and Suraj Singh Birsa,

a student of the tribal and regional languages department, Ranchi University, became its secretary. Interestingly, Ram Dayal Munda was elevated to the post of acting vice-chancellor of Ranchi University in June 1986. The formation of the AJSV led to a rift between politicians and students, resulting in further fragmentation of the movement.

During October 19 to 20, 1986, a conference of students and intellectuals was held at Jamshedpur in which N E Horo and Ram Dayal Munda along with other prominent leaders took part. A demand was made in the conference to grant an independent status to AJSU.⁶¹ This was followed by another conference at Hazaribagh between December 30 and 31, of the same year, when the old demand for a separate Jharkhand state was revived and it was decided to launch a militant agitation to achieve the goal.⁶²

The World Council of Indigenous Tribal People founded in 1975 under the influence of World Council of Churches, provided another platform for the tribals in the Chotanagpur region when an Indian Council of Indigenous Tribal People appeared as a branch of the World Council. In the first week of August 1987, the council sent a delegation to Geneva to participate in the deliberations of the United Nations Working Group on Indigenous Populations. The delegation included A K Kisku from West Bengal representing the Santhal tribe, Bishop Nirmal Minz from Chotanagpur representing the Oraon tribe and Samari Brahmachoudhury MP, representing the Bodo tribe of Assam.⁶³ The question of survival of adivasis in the face of exploitations of various kinds and their demand for the right of self-determination under a separate Jharkhand State, were raised in the conference. The Indian Council of Indigenous Tribal People held a conference at Ranchi from October 17 to 19, 1987, where 150 delegates from eight States took part. It was decided in the conference to make a serious effort to bring all the tribal factions in India under one umbrella.⁶⁴

Lack of co-ordination among the different factions of the tribal movement was a constant source of anxiety for the well-wishers of the movement, ever since the eclipse of Jaipal Singh. The idea of co-ordinating the activities of different factions was mooted towards the end of 1986, but without much success. Meanwhile, on August 8, 1987, the president of the Jharkhand Mukti Morcha Nirmal Mahato, was killed, allegedly by Congressmen at Jamshedpur. This led to a vigorous agitation and further underlined the need for unity and co-ordination among different factions.

FROM ETHNIC TO REGIONAL MOVEMENT

A conference to bring different Jharkhand groups, irrespective of their nature and composition, on one platform was held at Ramgarh from September 11 to 13, 1987 and was attended by 438 delegates representing almost 50 political, cultural, students' and women's organisations.⁶⁵ Prominent among the participatory groups were the Jharkhand

Party led by N B Huma, the Binod Behari Mahato group of the Jharkhand Mukti Morcha, two factions of the Jharkhand Kranti Dal led by Santosh Rana and Satyanarayan Sinha, the Indian People's Front, All Jharkhand Students Union, Jharkhand Liberation Front, MKSS and others. Though the Jharkhand Mukti Morcha (Soren group) stayed away initially, later joined the Jharkhand Coordination Committee. B P Kesri, head of the department of tribal and regional languages, Ranchi University, though himself a 'sadan', became the convenor of JCC.⁶⁶ A 23-point programme was adopted in the conference to achieve the goal of a separate Jharkhand State, comprising of 21 districts of Bihar, West Bengal, Orissa and Madhya Pradesh. A number of Jharkhand bandhs, 'rail roko' agitations and a Jharkhand March (in the third week of March 1988) were organised and a provisional government was formed.⁶⁷

The Soren faction of JMM demanded a reconstitution of the Jharkhand Coordination Committee, excluding non-political men like Kesri and others. In a meeting of the JCC convened by Kesri, to chalk out the future strategy for the movement, Sibhu Soren stressed two points: first, since Jharkhand movement was a political one, JCC should be formed by political parties only.⁶⁸ Secondly, if JCC comprises both of political and non-political organisations, half of its members should be taken from the JMM alone, by virtue of its stronghold in the area. Kesri, however, did not concede any of the demands and held that all the JCC members were co-ordinators of the Jharkhand movement, with equal status.

The most significant aspect of the movement under Kesri's leadership has been its broadening of the base. The movement no longer represents tribal chauvinism and has gradually involved the 'sadan' population of the Chotanagpur hill areas as well. Besides, a new wave of intellectual participation has given the movement some degree of maturity, it had lacked in its earlier phases. It has in its ranks today, a host of young academics, who not only have studied the socio-economic problems of the region in depth, but are well equipped to analyse the situation scientifically and argue their case quite logically. The movement thus, has come out of its emotional phase and today can boast of a strong intellectual base of its own.

Factionalism resurfaced during the third week of August, 1989, when the militant AJSU severed its link with the Co-ordination Committee, disagreeing on the question of participation in the Ninth Lok Sabha Elections. However, a change in the leadership of the students' body, effected in its annual convention held at Ranchi, on January 7, 1990, reversed its earlier stand and decided to take part in the ensuing Assembly Elections in Bihar, on the JMM symbol. In another significant development, the two factions of the Jharkhand Mukti Morcha, led by Sibhu Soren and Binod Behari Mahato respectively, reunited after seven long years on January 7, 1990, at a joint convention of both the factors held at Dumari, in Giridih district of Bihar.⁶⁹

Meanwhile, in the 9th Lok Sabha Elections of November, 1989 and the subsequent assembly elections of February 1990, JMM emerged as the strongest Jharkhand group in tribal Bihar. It captured three Lok Sabha seats and 19 assembly seats in Bihar. Interestingly, Bharatiya Janata Party which won 39 assembly seats, got 21 of them from tribal Bihar alone. Thus, JMM was relegated to the third place in the tribal region after BJP and Congress(I).

Most significantly, in a major policy shift, the JMM accepted the proposal of BJP to confine the agitation for a separate Jharkhand state to the geographical boundaries of the Chotanagpur and Santhal Parganas of Bihar only. A 'Jharkhand Vanachal Action Committee' was formed at a meeting held at Patna on July 19, 1990, with Sibhu Soren as the convenor of the steering committee, having representation from even the Communist Party of India, apart from the JMM and BJP.⁷⁰

IV

Issues of the Movement

Tribal groups in India, like so many backward castes, were used to accepting their unequal economic positions without much hue and cry even a couple of decades ago. But today, the spread of education and rising consciousness have led these groups to challenge the fatalistic theory of deprivation, put forward by the privileged classes, to keep the deprived in subjugation for good. The result is an outgrowth of large scale discontent among different ethnic and regional groups within the country. A close perusal of the nature and growth of the Jharkhand movement brings into light four basic issues, instrumental in mobilising the otherwise peace loving tribal people of the region, to raise their voice of protest against the subordination and injustice done to them by the migrants.

LAND AND FOREST ALIENATION

One of the great sufferings endured by the tribals in the region, for generations, has been the alienation of their ancestral land of which they were masters from times immemorial. Land, to them, is a 'part of their socio-cultural heritage'. The emotional ties with the land resulted from the fact that it contained the burial ground of their ancestors with whom they would be united after their death and the sacrificial grave where they propitiated their spirits.⁷¹

Like land, forest is also intimately connected with tribal life. "It is the abode of the spirits, the place of worship ('sarna') and the seat of life cycle ceremonies including burial ('sadsandiri')"⁷² Forest provides the tribals with food, fuel, fertiliser, fodder, farm implements and material equipment for family use. Thus, the Birhors of Purulia in West Bengal and Cheros of Palamau in Bihar sustain on hunting and gathering. Rope-making by the Birhors, bamboo basketry of the Mahalis, Deswali Majhis' rearing of cocoons, gathering of 'lak' by Munda, Santal, Kherwar and Chero tribes of both Bihar and West Bengal amply illustrate the importance of forests in tribal

life. Moreover, the need for leaves and twigs after birth and death and many other religious rites and rituals starting from 'sandra' or 'desh sikar' to the erection of 'mandap' or canopy for marriages, unmistakably point towards a symbiotic relationship between the forest and the tribal communities.⁷³

In a memorandum submitted to the United Nations Working Group on Indigenous Populations in August, 1987, Jharkhand leaders observed that "the land rights and ownership introduced by the British colonial power and adopted and implemented by the national government after independence, the forest laws, making land and forests as commodities for sale and purchase under the money economy and marketing system have enabled outsiders, moneylenders and the government, to grab adivasi land by fair or foul means".

In fact, transference of tribal land in the hands of outsiders, especially moneylenders and absentee landlords, started much before the advent of the British into the region. Alienation of land began as early as the fourth century AD and continued even during the reign of the Mughal rulers. However, the introduction of Permanent Settlement in 1793, after the British annexation of the region and the subsequent Sale and Rent Law of 1859, further encouraged transfer of land from the original inhabitants to the outsiders. The East India Company and the subsequent British government were mainly interested in collecting revenues. They used to auction landed property of the tribal chiefs for failing to pay their dues in time. Thus, gradually, most of the fertile tribal lands were transferred to the 'diku' moneylenders and absentee landlords. The Chotanagpur Tenancy (Amendment) Act of 1903 and the Santhal Parganas Settlement (Amendment) Regulation of 1908 could control such illegal transfer of land, but only partially.

With the opening up of the area to mining and industry, at the turn of the nineteenth century, tribals were further displaced. Many of them became landless 'coolie' labourers. Some even were driven to begging. The Tata Iron and Steel Company was set up at Jamshedpur and other industries like the Hindustan Copper Mines, the Indian Aluminium Company, the National Coal Development Corporation and others followed soon. Since independence, with the launching of the Five-Year Plans, both the Central and the State governments established heavy industries in and around Ranchi, Rourkela, Bokaro and Hatia. The need for power for these industrial centres resulted into construction of several irrigation and power projects across Koel-Karo, Damodar, Subarnarekha, Tenughat, Kangsabati and Chandrapura. Construction of dams and hydroelectric power projects engulfed thousands and thousands acres of land, without providing adequate compensation to the owners or making arrangements for their proper rehabilitation. This resulted in many of the former tribal landowners working as 'coolies' on their own land on poor wages. Along with the big industries, ancillary industries also developed, taking away

more and more tribal lands. More than 230 mines, situated in the Kolhan area of Singhbhum district, also caused large-scale displacement of tribals from arable land.

All these industries, mines, irrigation and power projects brought in their wake increasing urbanisation. Thus, the Chotanagpur-Santhal Parganas belt which consisted of only 13 towns in 1901, went through an unprecedented growth of urban centres numbering 95 in 1971. In Singhbhum district alone, the number of towns jumped from four in 1931 to 24 in 1981.⁷⁴

Besides, the government, both during the pre-independence and post-independence periods, has taken away sizeable portion of forest land under the Indian Forest Acts 1878, 1927 and the Bihar Private Forest Act 1927, in the name of scientific management of forests and economic development of the nation. Critics argue that the alternative approach of social forestry, though may have a bit of forestry in it, lack any social content. Plantation of mostly non-indigenous quick-growing trees may one day drive out 'Sarna Buria' or the Golden Old Lady of the Oraons and also may displace many gods and goddesses of other tribes.⁷⁵ Such schemes are generally denounced by tribal leaders as a part of the overall policy of the government to uproot the tribals and peasants from their own land, forcing them to earn their livelihood in the urban and industrial centres.

IMMIGRATION

The people of Chotanagpur have witnessed steady flow of outsiders to the region ever since the days of the fourth Nagbanshi King Pratap Rai, in the fourth century AD. Subsequent rulers even invited outsiders to settle in the region for military, religious and scholarly pursuits. Occasional military invasions and the resultant changes in demographic patterns were taken into their strides by the local people. The process continued till the Mughal period without much of a problem in evidence. Trouble started to surface when the indigenous people, apart from losing their ancestral lands started losing their cultural identity and distinctive qualities as well, under the influence of dominant religion and cultures. Rapid industrialisation and development of surface communication facilities under the British rule, further facilitated immigrants, in increased volumes, to come and settle in the region.

The industries and power projects established in the region, needed some skilled personnel and so, moving in of some specialists from other parts of the country was quite natural. But immigrants came in large numbers even in areas where no such specialised skills were needed. This large-scale influx of outsiders, mainly from north and central Bihar, not only deprived the local people of the newly created job opportunities and training facilities but also practically forced them to leave their own land in search of menial jobs in far distant places like Punjab, Assam and others.

The steady influx of external population and gradual eviction of the local people

made the tribals minority in their own land. In 1891, there were only 1,00,000 outsiders in the Bihar portion of Jharkhand region. Till 1921, the growth of immigrants was rather slow. But since 1939 the rate picked up and today immigrants from north and central Bihar account for some 2.6 million people.

Since independence the Chotanagpur area has been one of the fastest growing areas in the country in terms of population growth. The industrial cities of Ranchi, Jamshepur and Dhanbad and their peripheries have simply exploded with population. The influx of outsiders has just reversed the tribal-non-tribal population ratio in the region over a period of thirty years. While the ratio was 60/40 in favour of tribals in 1951 it has just been reversed in 1981. Santhal Parganas, Palamau, Hazaribagh, Ranchi, Dhanbad and Singhbhum—all registered a decrease in tribal population between 1931 and 1981, ranging between two per cent and ten per cent. In Singhbhum district alone, the Scheduled Tribe population fell from 54.08 per cent in 1931 to 44.08 per cent in 1981.

Not only the tribals were made minority in their own land, their access to different industrial jobs and training facilities were also reduced. According to the leaders of the movement, till 1971, only twenty-four per cent of the total workers employed in different industries in Singhbhum were scheduled tribes or scheduled castes though they constituted fifty per cent of the population in the district and supplied 54.2 per cent of the total workforce. In the urban area of the district, only 15.9 per cent of workers belonged to these groups. The immigrants, accounting for not more than fifteen per cent of the total population of the region, thus, grabbed most of the lucrative jobs at the expense of the local Jharkhandis. This disproportionate representation of the local people in industrial sector and their involvement in temporary, lowly paid and unskilled jobs clearly proves that apart from their lack of required skill and perhaps a preference for seasonal employment, tribals, in general, were deprived of the educational and training facilities, mostly cornered by the privileged sections of the society. They were deliberately kept as a reserve workforce of cheap, segregated, unorganised labourers in the interest of the industrialists and business houses.

In spite of Constitutional provisions regarding reservation for the tribal and local people in training and jobs under the public sector, nearly 90 per cent of the training facilities in general education, engineering and medical spheres as well as in government jobs, are filled up by outsiders. The well-intended effort of the government to encourage the weaker sections by providing special privileges to catch up with the rest of the people in the society, is constantly being frustrated by vested interest groups. Dereservation of a post on the plea of non-availability of qualified candidates, is a very common occurrence today. Besides, outsiders non-tribals very often deprive the genuine scheduled tribe people by acquiring fake certificates through various unscrupulous means.

CULTURAL IDENTITY

Three major cultural streams, viz, Aryan, Dravidian and Austroasian, represented through various languages, have converged in the Chotanagpur Plateau, to create a cultural synthesis of its own kind. This culture has attained a distinctiveness over the years, marked by a close relationship between nature and man, egalitarianism in social structure, accommodative history, equal sharing of economy, secularism in religious pursuits, a democratic political thinking and a people oriented art and literature.⁷⁶

So long as the tribals maintain a safe distance from the people of the plains, they retain their own identity and culture without much distortion. Thus, the Mundas in Chotanagpur have been able to maintain their traditional social structure and customs intact, as they are less accommodative in nature. But it is known that most of the tribal societies, today, are neither isolated from the surrounding non-tribal societies nor are they free from influences of urban values and dominant religions. Improvement in communication facilities has made tribal pockets more vulnerable to outside influence. Such contacts with outside world have created a dilemma in the tribal life and culture, resulting into an identity crisis for the Jharkhandis. Neither are they able to acclimatise to the urban and alien values, nor are they in a position to preserve and pursue their own traditional rites, rituals and customs. Thus, we find the Oraons and Hos are gradually losing their identity because of their accommodative nature and readiness to mix with outsiders. In the process tribal language, religion, customs and tradition are losing their purity and in some cases are being submerged under the influence of forces of modernisation.

Jharkhandis, generally, are worshippers of nature. But a large-scale devastation of forests owing to rapid industrialisation, urbanisation and unscientific mining and the consequent social forestry schemes, planting mostly non-indigenous, quick growing trees have adversely affected their life pattern and religious beliefs. Traditional tribal religions such as 'animism', 'sarna dharam' nature worship are gradually being replaced by Christianity, Hinduism and others. Change in adivasi food habits and festivals are also quite evident. Santhals, for instance, are abstaining from beef-eating and seem to be less interested in celebrating 'Itesh Bapla' 'Njrbolok Bapla', 'Sanga Bapla' and 'Bahador Bapla' as a result of their close proximity with the neighbouring Hindu society.⁷⁷ Possessing a very rich tradition of their own they are thus, not only denying themselves of a rich protein diet but also sacrificing their age old cultural heritage. Besides, the adivasi society, traditionally known for its egalitarianism, is being divided today on communal lines and even the hierarchical notions of caste and class are creeping in. Agriculture is made subservient to business and industry, literary and artistic pursuits are losing their participatory nature and becoming more passive and observation oriented. As a matter of fact, the tribals, unable to

sides, are a frustrated lot and as a natural consequence developing marks of a negative identity for themselves. They are being branded by the 'civilised' world as 'lazy bum', 'good for nothing', 'drunk' and 'criminal'.⁷⁸ Some adivasis like the Lodhas of Bengal and sections of the Gond in Madhya Pradesh are even described as criminal tribes. Thus, the notions of a noble, savage and a healthy tribe are fast becoming a myth. These signs of cultural degradation, sometimes, generate among the tribals a common psychology of identity assertion, for their own survival.

The Jharkhand region abounds in minerals and provides a substantial portion of India's total requirements in the field. Chotanagpur and Santhal Parganas though comprise only 2.5 per cent of the total geographical area of our land, nevertheless, account for more than twenty-five per cent of the mineral production of the country. The Jharkhand region alone, comprises of one-fifth of the public sector enterprises of the country. No less than 14 large-scale industries, with investments of crores of rupees, are scattered around Singhbhum district only. These industries produce iron and steel, copper, aluminium, uranium, lead, mica, glass, cement and fertiliser which are essential as far as India's growth and all round developments are concerned. But, if one looks at the development of this region in particular, in respect of irrigation, rural electrification or road construction, its backwardness is more than evident.

The people of this hilly terrain of south Bihar feel discriminated against the plains of northern parts of the state. The Chotanagpur plateau, enriched with mineral, forest and industrial resources, though contributes almost seventy per cent of the total revenue collection in Bihar, the expenditure of revenue made in this region is a paltry 20 per cent. Only five per cent of the total land in the region has irrigation facilities, while not more than five per cent of the total rural areas of south Bihar have electricity and only five kilometre road per thousand kilometre is paved.⁷⁹ Thus, perpetual neglect of the Chotanagpur region by the successive governments in Bihar, has led to mass discontent in the area.

The most disturbing feature of the development process in the region is that out of the meagre amount of money allotted, only a small portion reaches the actually needy. Thus, though the local people are known for their sincerity and hard work they are sliding down below the poverty line day by day. Many of them who are literally forced to leave the region in search for menial jobs, under the pressure of large-scale influx of immigrant job-seekers, nevertheless, find them in a precarious situation as they are not treated as scheduled tribes, eligible for the developmental benefits guaranteed under the Constitution of India. Thus, over a million tribal people from Chotanagpur, who had migrated to the north-eastern region of the country and eventually settled there as tea plantation labourers, face an additional discrimination.⁸⁰ This discrimination, however, is caused by their local tribal brethren who are not prepared to share the

under the Constitution. Those who still remain in their ancestral lands, as unskilled 'coolie' labourers, are gradually being sandwiched into slum areas of newly developed industrial and urban centres.

Besides, the tribals are still exploited by middle men who, most of the time, corner the fruits of meagre developmental activities carried out in the region. Some times they take advantage of the distance of the collection centres of the Forest Development Corporation from the tribal villages and exploit the tribals by controlling the sale of 'tendu' leaves and 'Mahua' fruit. Tribals produce the best lac in the world on their host trees, apart from vegetables and fruits. But regarding the marketing aspect of their produce, they are practically at the mercy of the middle men.

The attack on the ecological balance of the region by greedy timber merchants as well as by unscrupulous miners, affect the tribal life in more than one ways. Apart from large-scale destruction of forests, unplanned mining activities, by hollowing the earth underground, seriously reduce the capacity of the soil to retain moisture, which in turn, affect the productivity of land in general. With little irrigation facilities and problems of diminishing productivity of land, the large 'mono-crop' area of Jharkhand is gradually robbing its inhabitants of all the possible means of livelihood, turning them into a vast reserve of 'coolie' labour.

V

Conclusion

The Jharkhand movement is basically a protest movement against the exploitation of the indigenous tribal people by the outsider 'dikus'. To quote the election manifesto of the Jharkhand Mukti Morcha in 1980, "we want Jharkhand free from exploitation; a Jharkhand where those who work will eat and those who loot will go". The aim of the leaders is to emancipate the area from the clutches of exploiters, moneylenders, corrupt bureaucrats and vested interests. They describe the movement as a search for national identity in an environment of extreme exploitation and demand "the collective right of self-determination for economic, social, cultural and political identity of indigenous tribal people".⁸¹

It must be admitted to the credit of the leaders of the movement that separatism in this region has not so far degenerated into secessionism. It is true that a five-member delegation, representing different tribes of India, went to Geneva to present a memorandum to the UN Working Group on Indigenous Population, in the first week of August 1987, to contest government of India's contention that "there are no indigenous peoples in India". But over and above, the movement leaders have confined their demand to a separate state "within the national and constitutional framework of the Sovereign Democratic Republic of India".⁸²

In defining a 'Jharkhandi' or 'local people', the movement's leaders are quite liberal and have not taken any narrow ethnic view. The term 'Jharkhandi' today, includes both

who, apart from residing in the region, observe local festivals, worship the tribal deities, share tribal culture and take pride in the martyrdom of local heroes, irrespective of their language, religion, caste or sects, are considered to be 'Jharkhandis'.⁸³

The leaders of the movement argue that the 'Jharkhandis', belonging to the same tradition and cultural identity, have been artificially divided and put into four different states. Such division, they hold, has not only weakened the 'Jharkhand nationality' as a whole and given rise to several problems like that of a common link language and common script for the people, but has also facilitated the vested interests to perpetuate socio-economic exploitation in the region.

One finds some logic in the arguments of the movement leaders when they point out that if Andhra Pradesh could be created out of Madras (in 1953), if Maharashtra and Gujarat could be carved out of bilingual Bombay (in 1960), if Haryana could emerge out of Punjab (in 1966) and Assam could be divided into so many states in the north-east like Nagaland, Meghalaya, Tripura, Mizoram or Arunachal Pradesh, without damaging India's national unity, then why the demand for an additional Jharkhand state should be labelled as anti-national, as one, going against national integration?

But one must remember that creation of a separate State is not an end in itself. The movement's leaders feel that the creation of such a State will put an end to all sorts of discrimination and exploitation they face today. Such optimism may not necessarily prove to be correct. Formation of a separate Jharkhand State may not provide an adequate answer to the problem of exploitation. There is no guarantee that a new set of exploiters will not take over from the present set of beneficiaries. Problem of exploitation is, basically, a class problem. There is no reason to believe that the 'local people' are exploited only by outsider 'dikus' and once the ruling power is restored to the Jharkhandis themselves, all sorts of discrimination will disappear.

Moreover, it is not possible to carve out exclusive homelands for each and every ethnic group in India. Even if a Jharkhand State is created, not all of its inhabitants will share Jharkhandi culture, take pride in Jharkhandi tradition or participate in different festivals of the region. So there is a possibility of similar separatist demands cropping up in the future, within the same region. As there exists a great deal of intermingling of different communities all over the country, it is almost impossible to satisfy the aspirations of each one of them to have separate and distinct lands of their own, free from outsiders. Actually, there can be no end to such demands in a multi-ethnic society like that of ours. Even partial success of any such movement, to draw attention of the government and resulting in subsequent pacts or agreements, often encourages similar forces to raise the voice of separatism to gain some concessions from the government.

This is not to oppose the demands of creating more and more States. Whether

question of administrative expediency, ethnicity should not be the determining factor. In fact, considering the number of nationalities and sub-nationalities residing within India, even 50 States may prove to be too inadequate to satisfy all of them.

Whether a separate State of Jharkhand is created or not, one cannot and should not overlook the genuine grievances of the people of the region. The problem of economic underdevelopment along with that of cultural submergence are to be understood in two different planes. The Jharkhand question is not merely an economic one, it has its psychological aspects too. The Indian economy, as such, is under-developed, but not everywhere does economic backwardness result in movements of this type. The fear of being swamped by the dominant cultural streams, the suspicion of losing one's own identity as well as the feeling of alienation from the national mainstream, very often lead to movements of self assertion, which demand sympathetic consideration but certainly do not deserve contempt or negligence.

On Birati, the CPI(M) and Tradition in Bengal

Brinda Karat

AT a time when the formation of broad political alliances is an issue of debate in the women's movement, critiques of differing ideologies from a gender point of view have an added relevance. As the biggest Left force, the CPI(M) has often been the focus of debate, as also the subject of harsh criticism. There is ample room for a discussion on the weaknesses of gender insights in the prevailing ideology and practice of the Left, particularly the CPI(M). Such a discussion should strengthen the process of self-criticism and correction at different levels of the party and the Left in general. As is clear from its own documents, the CPI(M) is far from claiming for itself the mantle of infallibility. However, it cannot be denied that on all major issues facing the women's movement the CPI(M) and the Left parties have taken an unambiguous pro-woman stand. In the last decade or so starting from the Mathura rape case and the changes in rape law, to the debate on dowry and domestic violence, the Muslim Women's Bill, the Sati murder, the offensive of religious fanaticism on women's rights, the question of economic independence of women, the role of the state vis-à-vis women's rights, as in Tripura, and on many other issues the CPI(M) has reflected the concerns of women.

However, these positions have been prompted by a particular understanding of the 'gender question' which seeks to find its roots not in a male-female contradiction or male attitudes but in the development of class society and locates its specificity in wider socio-economic realities. Many women's groups reject this approach as 'class subsuming gender' and hence as patriarchal. One or two incidents are picked out and propagated as proof of Left patriarchal ideology. Tactically this position is manifested in an approach politically hostile to the Left in general and the CPI(M) in particular.

Although Tanika Sarkar's article 'Reflections on Birati Rape Cases—Gender Ideology in Bengal' (EPW, February 2) implicitly distances itself from the viewpoint of gender as the axis of social analysis, with reference to the relevance of 'original socialist critiques of bourgeois decadence which included critiques of modern patriarchy' the approach is not dissimilar. One is also struck by the language used to describe CPI(M) supporters, such as 'besotted believers in the Left Front's general progressive potential'.

Sarkar's attempt is to use Birati and Shamali Gupta's statement printed in *People's Democracy* as the basis for what

is a preconceived theoretical construct. If Sarkar was indeed interested in a 'comprehensive' analysis of Birati by the CPI(M) or AIDWA she could as easily have referred to a detailed analysis by the CPI(M) member of parliament Malini Bhattacharya published in the AIDWA bulletin *Women's Equality*, or even to the AIDWA's own statement on it. But because Sarkar is *politically* not prepared to even consider that the language used in the statement in question was indeed an aberration and does not reflect either the party's or AIDWA's stand, she uses the questionable method of ignoring the other statements and analysis made on the same incident by party and AIDWA spokespersons. Is not the reliance on a single statement to build a theory, the trivialisation of theory itself? Perhaps Sarkar will be interested to know that when a parliamentary committee was set up in 1980 to amend the rape laws, the CPI(M) representative on the committee, Sushela Gopalan, was one of those who strongly argued for inclusion of the Law Commission's recommendation prohibiting the reference to 'previous sexual history' of the victim in a rape case.

Further, the actual role of the CPI(M) and mass organisations in the aftermath of Birati is distorted and underplayed. This again is a logical fall out of a preconceived prejudice—how can a party which believes that the rape of 'prostitutes' is no rape at all (Sarkar's inference) then organise big protests against it? As described in Bhattacharya's article referred to earlier, there was a big campaign launched by the CPI(M) along with other mass organisations to 'mobilise mass opinion for prevention of such incidents in future', to break illicit liquor dens and protest police complicity. Sarkar does not mention the former and dismisses the latter as 'policing functions'. Any activist working with women in slums knows how such liquor dens make the women in that area so much more vulnerable. In a city like Delhi, for instance the absence of a network of Left mass organisations and the subsequent lack of grassroots level social intervention make the work of women's organisations that much more difficult when faced with criminal activities and the power of underworld hoodlums. No amount of 'consciousness raising projects' as advocated by Sarkar would have the slightest meaning unless accompanied by a frontal attack on these criminal vested interests.

In Birati most of the women in that particular 'jhuggi' cluster were very poor Bangladeshi immigrants working as

domestic maids. The local police in spite of previous public protests, continued to connive with rival gangs of smugglers and illicit liquor barons operating from that area. Some of the women were also involved in this activity with different gangs and it was the rivalry between two gangs which directly led to the rapes. Understanding the circumstances of a particular rape case is not to justify the rape but to identify the factors which make women even more vulnerable.

One of the biggest problems faced by women's organisations is the protection given to rapists by local political forces. One need only recall the experience of Pararia, for example, where the then Congress(I) woman MP denied that the rape had taken place, or even Gajraula where eight months after the rape of two nuns the criminals have not been apprehended because of the protection given by local politicians. Sarkar dismisses the efforts of the local CPI(M) and others to apprehend the culprits, which they did in a short time, as locating a gender problem as 'a law and order one' or 'a bureaucratic preoccupation with law and order'. Perhaps if ruling parties in other States showed a similar preoccupation there would be an improvement in the dismally low figure of only 3 per cent convictions in cases concerning atrocities against women. This is not a question of law and order or bureaucratic preoccupation, but of the political will of the state agencies to take action against perpetrators of crimes against women. The women's movement has repeatedly underlined the importance of this issue. This political will and action would convey important messages, the implications of which have been known to be significant on public consciousness.

Similarly, on the Bantala issue, Sarkar completely distorts the CPI(M) position. The chief minister's statement that it 'was the work of anti-socials and criminals' was in response to the charge made by the Congress(I) and picked up by sections of the Bengali press that the savage lynchings were motivated by political considerations. It did not at all attempt to justify the lack of a preventive social intervention as is implied by Sarkar's criticism of it being a 'sadly circumscribed notion of society' and an 'admission of lawlessness in the Left capital'. The criminalisation of politics and social life in general has been a major concern of women's organisations all over the country because of its direct impact on the lives of women. In Bengal, far from being defensive about the continued existence of a criminal underworld the CPI(M) has taken the initiative to organise big social campaigns through the formation of citizens' committees against their activities, which include cultural functions, youth club activities, public meetings, etc. One of the successful campaigns run by these committees for in-

in Kallighat. On numerous occasions the efforts of these committees functioning at the grassroots level have been directed towards the protection of women in cases of domestic violence. If instances of a woman screaming for help being met by the closed doors of her neighbour are not the rule in Calcutta, it is precisely because of the continued efforts for raising social consciousness, and encouraging grassroots level participation in community work.

Unlike Sarkar, activists in Bengal cannot be satisfied with such smug conclusions that 'Bantala mocks the notion of civic values of Calcutta citizens'. Rather it is a grim reminder of how deeply entrenched and powerful such forces are at different levels of society and how much more needs to be done to prevent such failures of social intervention. There is no particular 'Bengali trait of respect for women' which Sarkar scoffs at. On the contrary it is because of the continuous activity at the ideological political and social level of the Left Front that the kind of degeneration of social life that we see in other cities is not there. Those who lived in Calcutta in the early seventies when criminals almost ruled the city under political patronage will remember the terror and insecurity which confined women to their homes after dusk.

For weeks after Bantala the CPI(M) organised numerous processions, a whole series of street corner meetings in South 24 Parganas, Calcutta and other areas in Bengal. In Calcutta where the Municipal Corporation elections were being held the issue was discussed on political platforms on an extremely wide scale in the city. For Sarkar, none of these occurred. A feature of yet greater political significance she writes "was that after the initial visits and speeches by Left Front dignitaries and MPs the matter was left to rallies by women's organisations alone". Is this informed criticism or outright hostility?

On reading Sarkar's piece, another question emerges repeatedly. What if Bantala and Birati had not occurred? What if the offending statement had not been made? Would Sarkar's theory have been different?

No, it would not have been. Sarkar's fundamental argument is based not on Birati but on a particular reading of history which sees the Left in Bengal carrying forward certain traditions *vis-à-vis* women which militate against the concept of a free 'womanhood'. According to her these traditions relating to dependent female identities were fixed by the so called Bengal renaissance, and were all encompassing and powerful enough to form a stable consensus for gender ideology in Bengal a century later. Although the analysis may add new insights into the particular literary works she mentions, her view of the 19th century bourgeois social reform movements is both restricted and static. In a reaction perhaps to what she sees as an uncritical glorification of that period by standard 'Bengali'

aspect. Although she asks the question, 'what are the prominent traditions for looking at womanhood in Bengal' her analysis is based on a discussion of only one trend in the movement ignoring others as though they were irrelevant to the formation of tradition.

Vidyasagar for instance may have died a broken man disillusioned by the failure of his widow's marriage efforts as she says but how does that negate the possibility of his work forming an enduring tradition? One has to look at the Bengal renaissance in its entirety in its historical context and in what it achieved at that time otherwise an understanding of its impact on later developments may be partial and also lead to a distorted perception of contemporary processes.

Even assuming that there is an enduring tradition which sees women only in the mother image as Sarkar argues, what is the evidence that she puts forward for the CPI(M) subscribing to it?

Her argument is built, firstly through a confusion in the terms she uses. Who is she referring to? Is it 'Bengalis'? Is it writers and film makers? Is it radical cultural workers? Is it the Left in general? Is it the CPI(M)? She uses all these terms interchangeably and ultimately reaches a position where everything 'Bengali' is attributed to the CPI(M) 'almost in the nature of an ideal socialist state where working class ideology is the dominant ideology for all sections of the people'. Just as Sarkar fails to see the Bengal renaissance in its historical context,

so she fails to see the objective conditions in which the CPI(M) and other Left parties are working in Bengal. These conditions relate to the correlation of social forces in India including Bengal, the class character of the Indian state and the reach of dominant ruling class ideology in the country as a whole, the circumscribed powers of a State government, apart from the substantial political base ruling class parties have in Bengal itself.

Having asserted that Bengali Left-CPI(M) where does Sarkar look for the CPI(M)'s consensus on patriarchal traditions? Once again she relies almost exclusively on an extensive analysis of modern Bengali literature and films to show the dominant mother image from the works of Satyajit Ray, Mrinal Sen, Shriyashendu Mukhopadhyay, Manik Bandopadhyay. As a critique of aspects of the contemporary cultural scene in Bengal it would have some relevance but what has this to do with the fundamental theoretical distortions she accuses the CPI(M) of? The problem is not just the method used but also the viewpoint. The dominant concern appears to be that of the Bengali 'bhadralok'. It hence, becomes possible for a supposed critique of Left gender ideology to completely detach itself from the basic classes it represents. In her entire article there is only a single reference (and that also a literary one) to tribal and peasant women whom she describes as 'distant and exotic figures' as no doubt they are, for the 'bhadralok'. There is no effort to test the validity of her suppositions against the lives of working class

Lopsided Growth

Political Economy of Indian Development

by **Pradhan H Prasad**

This collection of essays in political economy unravels the forces which have acted as a drag on Indian development. The Achilles heel of Indian development plans, the author argues, has been their preoccupation with investment planning to the neglect of institutional transformation. Within this broad framework the author discusses a wide range of subjects including macroeconomic plan models, choice of techniques, the persistence of outmoded production relations in agriculture, growing political assertion by the middle peasantry, roots of agrarian violence and uneven regional growth.

Bombay Delhi Calcutta Madras

women belonging to the minority community. Has there been any change in their status, in their self-image in the last decade in relation to the socially dominant classes as well as within the family? What has been the increase in their social and political participation? What has been the impact of the huge literacy drive led by the CPI(M) and mass organisations, as a method of empowering women? What has been the impact of land reforms on their lives? How far are they conscious of their rights and how far have the democratised Panchayats aided this process? It is significant that in both the States of West Bengal and Kerala where there have been CPI(M)-led governments, the parameters for measuring the status of women such as employment, health, education, wages, etc, show a better trend. But these questions are irrelevant in Sarkar's analysis. Although Sarkar is critical that the 'collective self-image' of 'Bengalis' (?) rarely elaborates women's status in terms of better health, education, employment facilities, she herself does not do so.

In what has now become standard so-called feminist critique, the participation of women in party work is seen as an extension of familial roles; in Sarkar's words 'essentially a giving and nurturing role, i.e. serving the party and class struggle' In bracketing non-party and non-domestic together, she implies that the opposite is the equation—of party work and domestic activity for women. Women do indeed serve the party and class struggle just as men do. It is ironic that whereas major women's organisations have identified the marginalisation of women's participation in the political process as an important factor in their declining status, Sarkar should not only dismiss but demean the splendid spirit and work of women activists in Bengal. The logical conclusion of her argument is that all female activity is necessarily unthinking and subordinate. She substantiates her point with reference to such trivia as the red and white saree worn by women volunteers, which for her denote 'haste motherhood'—completely missing that for them it represents the red and white colours of the party flag, a symbol of struggle. In challenging old stereotypes of women as mothers, sisters, daughters, care needs to be taken against the construction of a new model based on a middle class notion of free womanhood. Self-fulfilment as a hallmark of the emancipated woman could mean for the poor peasant women participation in struggles against those whom she perceives as responsible for the miserable conditions in which she lives.

Finally, the ultimate proof offered by Sarkar of the tortuous path of 'tradition' from the 'Bengal renaissance' to the CPI(M)'s endorsement of it is the three term electoral mandate the Left Front has received which according to her reflects the 'stable consensus' on gender ideology. The ideological and political work, the big struggle

and men, which permits the existence of a Left centre in an increasingly hostile political environment is thus negated by an absurd theoretical deduction which goes something like this:

Left Front rule = stable consensus on 'Bengali' tradition;
Bengali tradition = dependent female identities.

Left Front rule = dependant female identities.

Presumably if the Left Front lost the elections, the consensus would be broken! Or alternatively since the Left Front may not

that it does in other parts of the State, the 'consensus' has already been broken in the 'Left's capital'!

In conclusion, it may be said that one would have hoped that a serious scholar like Sarkar who has been sympathetic to the Left would have placed the weaknesses of the CPI(M) within the framework of its efforts to create an ideological alternative through the struggle to raise the quality of life for the mass of women in Bengal. That would have helped readers of her article form a balanced and objective assessment of the Left Front in that State, both in terms of its ideology and its practice.

Soaring Stock Prices

S M Sundaram

BARUA and Raghunathan (*EPW*, November 17, 1990) use the discounted cash flow model to value shares. In a modified form, the price/earnings ratio is taken as the measure which depends on factors such as the payout ratio, the return on investment of the projects to the companies and the return expected by the investors from the company's scrips.

For a sample of 23 companies, Barua and Raghunathan estimate 'g' (growth in dividends) and 'b' (payout ratio). Then they compute the P/E ratio for a chosen set of 'k', the return expected. The average of the computed fundamental P/E value, viz, 3.20, is compared with the observed average P/E value, viz, 21.42, for a chosen period. This marked deviance of the observed vs *a-v-s* the fundamental is highlighted. The authors go

on to explain the reasons for the present stock market boom and how this high P/E cannot be sustained.

The accompanying table presents another picture of the story. It can be seen that never in the past four years has the observed P/E been lower than 14 and anyway never near the theoretically computed 'fundamental' value of 3.20. The month of August was chosen as that was the mid-period for the article also. But the results can be checked for any month of the year. In the sample, some cases with absurdly high P/Es have been omitted.

Perhaps the reasons for the high deviation of the observed P/E values from the theoretically computed fundamental values may be more 'fundamental' than just 'technical', as made out by the authors.

"My Master, I Am Back!" This Time With DHANAVARSHA (3)."

DHANAVARSHA (3)

Option 1 - Immediate Monthly Income.

Interest: 12.5% to 14%.

Get 66 cheques in advance.

Invest a minimum of Rs. 5000. Get a regular monthly income for 5½ years. The interest rate initially is 12.5% which increases to 14% by the end of the scheme. What's more you get all the income cheques in advance.

And that's not all...

You'll have 100% distribution of capital appreciation. Incentive for investing early. Encashment facility after 4 years. Loan facility from Central Bank of India. And also Income Tax benefits under Section 80I, and Wealth Tax exemption under Section 5.

NRIs too can invest on a non-repatriation basis.

You also have a choice of other options:

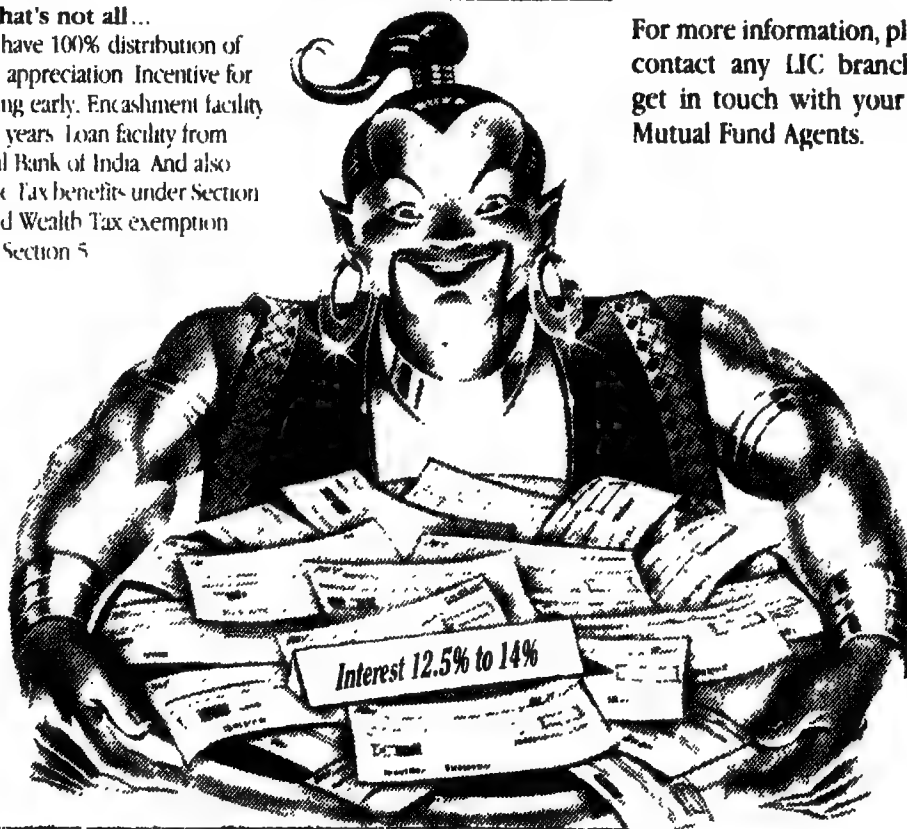

Option 2 - Deferred Monthly Income, wherein you defer income for one year and then get higher interest ranging from 16% to 21%. Options 3 and 4 - Accumulated Income/Capital Growth, in which you get a lump sum of 103% returns plus your appreciated principal amount.

Attractive incentive for early investors!

| Period | Incentive |
|-----------|-----------|
| May 1-15 | 1% |
| May 16-31 | 1½% |

All payments have to be made only at designated branches of the Central Bank of India. Also branches of Punjab National Bank in Northern India, Chandigarh, New Delhi and Bombay.

For more information, please contact any LIC branch or get in touch with your LIC Mutual Fund Agents.

DHANAVARSHA (3)

Hurry! Scheme open March 11 to May 31, 1991.

LIC Mutual Fund

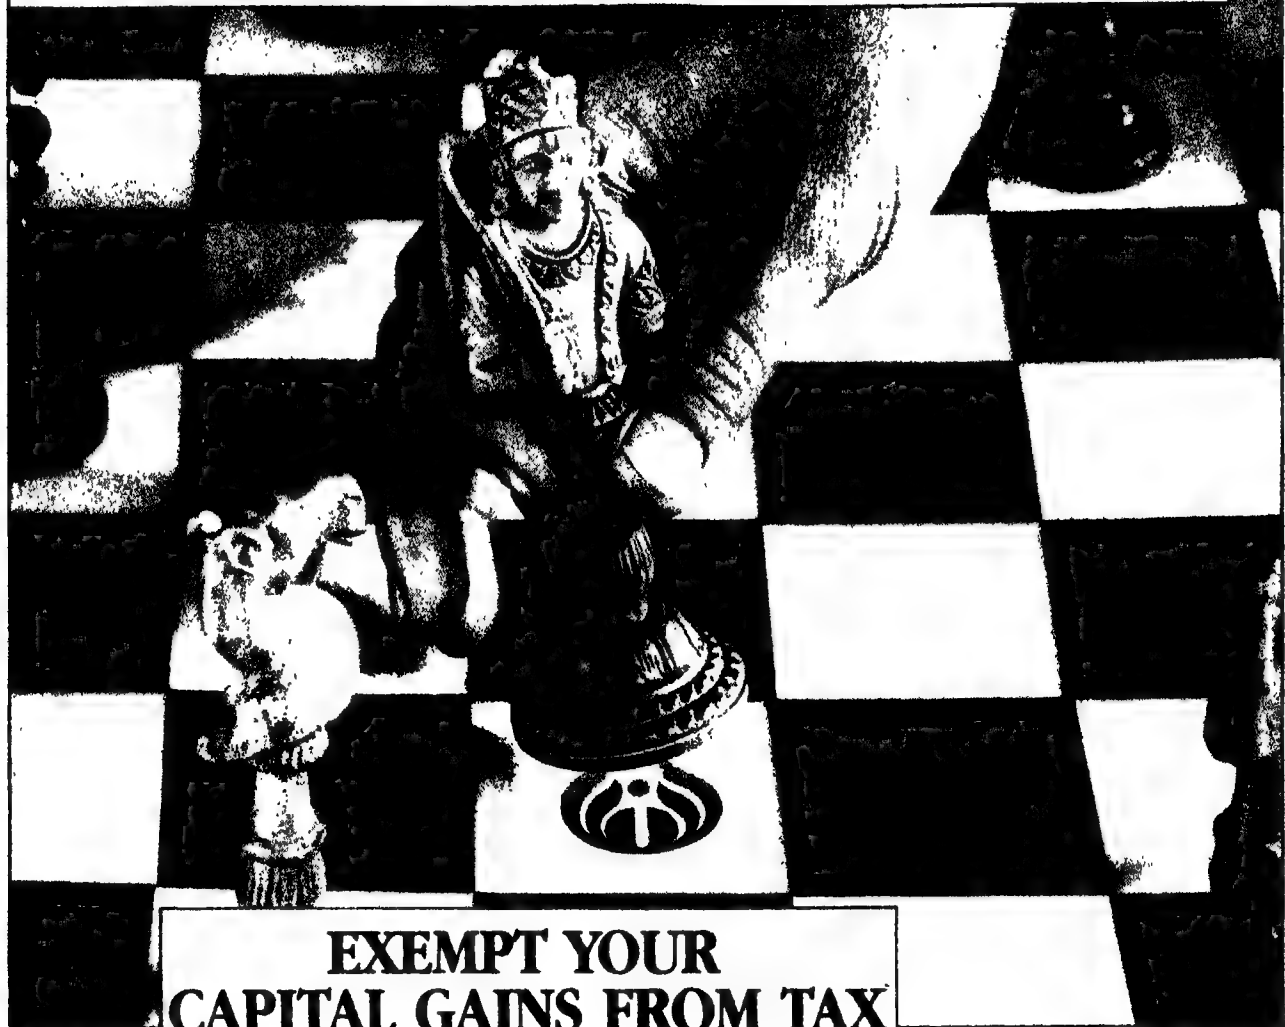

We'll help you meet your goals

Mutual Funds and securities investments are subject to market risks and there can be no assurance or guarantee of returns by the Trustees/Sponsoring Institutions. They are only indicative returns based on the investment policy of the fund. Past performance is not necessarily indicative of future results and may not necessarily provide a basis for comparison with other investments. Investors are requested to study the Terms of Issue printed in the brochure carefully before they invest in the Fund and in case of any doubt regarding the contents of the Advertisements/Terms of Issue, they may contact the LIC Mutual Fund.

A little planning, a lot of love...
and even with small savings
your child can be
a lakhpati by 21!

Invest in Unit Trust's
Children's Gift
Growth Fund

Today, he's a little baby in your arms. Your presence is all he needs to feel safe and secure. But all too soon, tomorrow will be here. And he'll be stepping out into the world. Facing the harsh realities of life.

Why not plan your child's future now? Invest in Unit Trust's Children's Gift Growth Fund. Under this plan, with small investments made over a period of time, your child can be a lakhpati by the time he's 21.

Q How should you invest to make your child a lakhpati?

A. If you invest in CGGF at the child's birth, here are some of the many options. (i) You can invest Rs. 1,100 at birth and then every year till the child is 15 years. (ii) You can invest Rs. 3,200 for 3 successive years or Rs. 1,900 for 6 successive years. (iii) You can invest Rs. 8,500 once and for all

Q. Suppose the child is older?

A There are plans for every age up to 15. The CGGF brochure has charts that explain it all. Please write in for it.

Q Who can gift it to the child?

A Parents, relatives, friends, companies or corporate bodies.

Q What is the minimum amount you can invest?

A Rs 500 and thereafter in multiples of Rs 100.

Q What are the returns on the investment?

A 12.5% per annum plus a bonus dividend every 5 years

Q Is there any facility after maturity?

A Instead of withdrawing the amount, the child can put it in any other scheme of UTI available at that time

For free literature on CGGF, please contact any Unit Trust office or Chief Representative or Agent, or selected Hindustan Petroleum or Indianoil petrol pumps

Or mail this coupon for more information to any of the Unit Trust offices

Compound Effect

With the entry of East Europe into the world's 'free market', products of developing countries are not only being flushed out of the East but are also being nudged out of markets in the North.

1219

Curious Afflictions

Each one of the elections in Tripura after 1988, when the Congress(I)-TUJS came to power, has been marred by large-scale rigging and booth capturing clearly instigated by ministers and ruling party MLAs. Given this, why has the Election Commission chosen to ignore the election-eve mass transfers of officials in the State?

1203

Jayalalitha has synthesised a new election-eve 'cause' to glorify women's issues. But why is she silent about the misuse and the abuse of women which has come to constitute the basis for the cinema and the print media in Tamil Nadu?

1204

Against Isolation

Today in the face of rising communalism and attacks on even the existing rights of women, it is more important than ever for the women's movement to build up wider links and alliances and not isolate itself.

1243

Input-Output Linkages

India's official input-output matrices can be a useful analytical tool for studying the structure of the economy and for projection exercises. Can the utility of this powerful tool be enhanced?

1235

Test of Public Gaze

Fuller public disclosures by financial institutions will go a long way towards correcting the inherent systemic deficiencies in the core area of financial intermediation. But there are too many interests which will oppose such a move.

1195

Losers All

The current elections in Nepal are taking place in an atmosphere of disillusionment among the people—and yet only a year ago there was so much enthusiasm about the overthrow of the party-less panchayat system.

1210

Partisan Press

The Gujarati print media played a highly biased role throughout the five weeks of the Jan Vikas Sangharsh Yatra. A revealing review.

1207

Of Plans and Planning

With a new government coming to power soon, will the goals of sustainable development which informed the deliberations of the Planning Commission under the V P Singh government continue to play a role?

1199

No Evidence

An inquiry into the reported planned 'massacre' of hospital patients of a particular community during the riots in Aligarh.

1205

Inside Sociology

The most significant and unexplored aspect of sociology in India today is the 'field' itself: the individual sociologists who have contributed to the making of the discipline in India in various ways.

1229

No Deceleration?

How valid is the hypothesis of an industrial deceleration in India after the mid-sixties? An examination of the evidence.

1244

Article 356

I WAS quite dismayed by the editorial column in your issue of April 6 on Article 356 with reference to the Madras seminar in which Jyoti Basu and M Karunanidhi participated. Your contention that the Chauthala case is a clincher for not altogether abrogating Article 356 is unacceptable. Having 'arguably' lost his majority, Chauthala disregarded the governor's advice to prove it in the legislature. A little earlier, at the Centre, Chandra Shekhar having got into the same boat evaded the issue of proving his majority by resigning and recommending the dissolution of parliament. And, since there is no counterpart to Article 356 at the Centre, all that the president could do (and did) was to dissolve parliament, with Chandra Shekhar continuing in a caretaker capacity, after satisfying himself that no other party was able to form a government.

Mutatis mutandis governor Mandal could have done the same. If no other party or coalition was willing to form a government in Haryana, he could have himself dissolved the assembly with Chauthala continuing as a caretaker. There was no need for using Article 356 and its use cannot be justified because of the 'violent proclivities' of Chauthala. What if Chauthala, who cannot change his stripes, had been able to muster a majority? What about other reigning chief ministers who might have a similar taste for rigging elections? In Amethi 1989 were we able to insure ourselves against the proclivities of Rajiv Gandhi? All that is necessary and possible in such circumstances is to trust the disciplinary proclivities of a T N Seshan to suitably deal with electoral malpractices.

Your statement that 'fundamentally' sovereignty in the Indian Constitution lies with the Centre is pernicious. Sovereignty lies, not with the Centre or the States, but with the people who are represented, in our dual polity, *both* in parliament *and* in their State legislatures. You have also suggested that unless the Centre has the powers to dismiss State governments, self-determination might have to be yielded to the States. This is a familiar bogey. In wanting to delete Article 356, Jyoti Basu and M Karunanidhi are demanding only the right to survival. It is in Punjab, which has been under president's rule for the last four years, that the demand is being made for 'self-determination'.

The problem with Article 356, as you have yourself recognised, is that it has

been systematically misused to undermine both democracy and federalism through arbitrary and wanton imposition of president's rule in the States. So much gangrene has set in over the years in this limb of the Constitution that it is best amputated. This was the thrust of the speeches of Jyoti Basu and M Karunanidhi in the Madras seminar. If you wish to take issue with their position, you need to be a little more thoughtful than you have been.

S GUHAN

Madras.

Against Communalism

THE Committee Against Communalism of the Jawaharlal Nehru University has organised a number of public meetings and participated in the activities organised by other organisations to uphold secularism. The committee has, over this period, been involved in distributing the document entitled *The Political Abuse of History* produced by the Centre for Historical Studies, JNU. On October 27, 1990, a day's symbolic fast involving people from all walks of life was organised at the Boat Club. This fast was in pro-

test against the danger posed by communal forces to the Constitutional commitment to secularism.

We believe that this threat to our country can only be challenged by people asserting their commitment to the secular ideals which formed the basis of our federation. There is, however, an urgent need to counter the propaganda of the communal forces. The task we have therefore set for ourselves for the immediate future include: Publication and distribution of documents, both academic and popular, to fight communalism; Organisation of workshops and seminars; especially for school teachers; Coordination with other organisations devoted to the cause of secularism to facilitate the sharing of information and of materials.

Towards this end we request you to form a similar committee in your institution. We could thus strengthen each other's efforts to forestall the communal apocalypse that threatens to engulf us all.

Bihar Drama

THE general election to the tenth Lok Sabha may accurately be characterised as an election which the major political parties, with one or two exceptions, did not want. After all, it was the unwillingness of these parties, the Congress(I) especially, to face the electorate that gave Chandra Shekhar the chance to adorn the prime minister's office, if only for a few months, with no more than a tiny break-away group from the Janata Dal accounting for barely one-tenth the Lok Sabha's total strength. So it is not entirely surprising that, even after the setting in motion of the formal election process, efforts should continue on the part of different political groupings to dispense with the elections in parts of the country at least where they themselves perceive their electoral prospects to be precarious.

Over the last week we have been entertained by what can only be termed a drama on the issue of elections in Bihar. Taking off from the prime minister's warning issued at a public meeting in Purnea in Bihar that the Centre would not hesitate to intervene if the law and order situation in Bihar did not improve, the Central government went through a series of contrived moves which were obviously its best attempts to put off the polls in Bihar. The law minister disclosed that the Centre was seriously concerned about the violence in Bihar and that it had sent a high level team to report on the situation in the State. He further volunteered the view that the situation in Bihar was '100 times worse than in Punjab' and that a report had been sent to the Election Commission indicating how alarming the situation was. This gave rise to speculation, no doubt deliberately fuelled by the party in power at the Centre, that a move to dismiss the Bihar government was under contemplation. But days after this statement the Election Commission maintained that it had received no report from the government and that it was in fact awaiting reports from its own 27 observers to decide on the issue of elections in the State. As we go to press the Election Commission is still awaiting the reports of its observers and the Central government is trying its best to get out of a situation which it had short sightedly provoked.

What prompted the drama hardly needs to be stated: the Samajvadi Janata Dal (SJD) is fielding some of its heavy-weights in the elections from Bihar apart from Subodh Kant Sahay from Ranchi, there is Yashwant Sinha from Patna and Hukumdeo Yadav and Digvijay Singh. And according to most assessments, none of them is likely to do particularly well. Even the chances of the caretaker prime

minister's close comrade-in arms, Surajdeo Singh in the Arrah constituency are rated hardly good, though if there are more than the usual quota of dirty tricks on polling day in this particular constituency, there are likely to be few doubts about where the responsibility for that will lie, given Surajdeo Singh's long-established reputation as the don of the coal belt mafia. In any case, that the SJD which needed considerable persuasion to take action against Chauthala in Haryana should sound so concerned about the possibility of rigging in Bihar is laughable.

Ironically, the Centre's convoluted attempts to postpone elections in Bihar have almost succeeded in creating a halo around the Laloo Prasad Yadav government. Bihar's reputation in the matter of election violence is, of course, well established. In the last elections repolling had to be ordered in as many as 1,239 booths in the State. This time too Bihar has seen its share of pre election thuggery, along with some of the other States. Even if it is accepted as a fact that the level of violence in Bihar has been marginally higher than that in the other 'sensitive' states, there are simply no grounds for postponement of the elections or dismissal of the State government. In fact that would be precisely reason for the Central government (and the Election Commission) to render all possible assistance to the State government to ensure smooth elections.

It is in this context that the Election Commission's ruling on the home guards issue is puzzling. It may well be that the home guards in Bihar, not unlike security forces of other descriptions in other States, have their own multiple and conflicting loyalties and biases. It may also be true that the force has been less than exemplary in its regard for public property or people's rights: witness the rampage it let loose recently in the State capital. But there is little evidence that in the other 'sensitive' States, such as Gujarat, the local security forces are any more responsible or impartial. In any case, if a highly communalised Provincial Armed Constabulary, the notorious PAC, can be used in communal riots, it is difficult to convincingly adduce communal or caste bias as sufficient ground for seeking to keep the home guards in Bihar away from election duties. If the home guards are to be confined to their barracks, Bihar will need further assistance with 25,000 of the 65,000 booths in the State having been declared 'sensitive' and as needing special security measures. In such circumstances can one expect anything other than a sharp rise in election violence, booth capturing and rigging?

Fractured Politics

FOR all the exchange of heated words between the government, the Election Commission and 'all the major political parties', the uncertainty surrounding the revival of the electoral process in Punjab has not lifted. Considering the all-round hostility that the idea has generated, with BJP and the Left being reluctant contestants and the Congress(I) avoiding the Punjab campaign altogether, there is every possibility of this fresh 'initiative' in the State being snuffed out. To begin with there is the curious conduct of a government that has been making much of its eagerness to find a solution to the Punjab problem. Having overruled the president's objections and promulgated an ordinance notifying elections in the State it subsequently climbed down and pressed the EC to postpone the date of the election. It is not unlikely that the EC, acting either independently or on advice, had fixed this schedule to call the government's bluff. It is perhaps merely a coincidence, but nevertheless one of some significance, that the announcement of the new date of June 22 was immediately preceded by the splintering of the Shiromani Akali Dal, after a brief unity of four months, into several groups of barely any consequence, leading to the almost total irrelevance of Simranjit Singh Mann in State politics.

The gap of over two weeks between the projected constitution of the tenth Lok Sabha and the date of the elections in Punjab provides adequate scope for devious arguments of the kind that has so far prevailed and whose sole contribution has been to aggravate a redeemable situation. Justifying his party's decision to abstain from participating in the Punjab elections Rajiv Gandhi has furnished characteristically infantile reasons. It is his contention that the decision of the minority government on Punjab is illegitimate, forgetting that as the abandoned progeny of his party whatever legitimacy the government has ever possessed is the invention of the Congress(I) and overlooking also the fact that other decisions of as much if not greater significance taken by the same minority government have evoked no principled protest from him. And much given to constructing the 'downside scenario', he has argued that in the event of a hung parliament and a secessionist-dominated assembly, the former will be able to do little about any move by the latter to secede. As president of a party whose entire recent history has been a record of casual disregard for democratic norms Rajiv Gandhi in obstructing the democratic process in Punjab is merely adhering to tradition.

Considerations other than the danger of secession have also undoubtedly motivated the Congress(I)'s withdrawal from the proposed joint platform of the

'major political parties' and its intention to review the election notification if it returns to power. The party is well aware of its loss of influence in the State and rather than make this obvious by contesting, it has opted to conceal it behind jingoistic hyperbole. In addition, a judicious use of the 'downside scenario' will give some flesh to the party's otherwise abstract appeal for a stable government.

Likewise for the BJP, purveying the Hindu version of nationalism, a great show can be made by misconstruing even a demand for greater decentralisation by the Sikhs as one more instance of the minorities supposedly getting above themselves. The Left, particularly the CPI, has much to lose considering its erstwhile following in Punjab. By projecting the fear that the electoral loss of the mainstream parties is the proportionate gain of secessionists, a disingenuous way will have been found to obstruct elections in Punjab.

Consequently, contrary to the Election Commission's brave but naive stance that the election process in the State under the April 19 notification is unalterable, there is a likelihood that no matter what the outcome of the general elections the new government may rescind the process. Already the BJP has announced its intention to review the notification. Meanwhile, the killing of candidates that is gradually under way will ensure countermanding in the affected constituencies. While the claim is that this is the handiwork of rival militant groups, the antecedents of the State's security establishment and its high stakes in preventing election make it difficult to absolve the latter.

Even so electioneering has commenced in Punjab and by all indications the various militant groups, all avowedly uncompromising proponents of secession, are in seeming disarray amidst mutual allegations of financial impropriety and betrayal of the cause. Unity has eluded Sikh political groups and though each splinter celebrates its break as an advancement of the Panthic cause it is more likely that the scramble for seats is the operative cause. AISSF (Manjit) and what is left of Akali Dal(M) are contesting separately since the modalities of seat sharing could not be worked out despite the intervention of Damdami Taksal chief Baba Thakur Singh. A faction of the Akali Dal (Badal) has split to form the Akali Dal (Panthic). And even as the proliferation of Akali Dals proceeds apace the number of AISSFs and Panthic Committees is also on the rise. The AISSF(M) split at Kapurthala, Ferozepur and other places accompanied by damaging allegations against the leadership while three versions of the Panthic Committee with different electoral sympathies have emerged. And even as each group prefaces its commitment to boycott elections with a denunciation of all other groups for par-

ticipating in elections, an unconcealed scramble for seats is on.

SPECIAL 301

Impermissible Procedure

NO sooner were we taken off Super 301 than we are back on clause Special 301 of the US Trade Act, this time in the company of China and Thailand. India has been hauled up supposedly for not providing sufficient protection to US patents. According to the US ambassador to India, William Clark Jr, the damage on account of insufficient protection to US patents "could be in the region of \$ 150 million".

Having been placed on the so-called 'priority list', retaliatory action on the part of the US government could follow unless a satisfactory process of negotiations for a solution—satisfactory to the US, that is—is set in motion. The Indian argument that such unilateral action on the part of the US government is inadmissible and improper because there are international forums for dealing with bilateral disputes of this type, in this case the GATT, does not cut any ice with the US, on the ground that it is still not decided whether or not protection of intellectual property rights comes under the GATT's purview. Indeed, India is known to be opposed to letting GATT cover intellectual property rights. Still, the basic Indian point remains that if in disputes relating to matters involving economic relations between nations resort is taken to unilateral actions, the result is bound to go in favour of the economically stronger nations. Just because the GATT does not cover disputes in regard to protection of intellectual property rights, the US cannot claim freedom to threaten unilateral moves, particularly when the threats, were they to materialise, would most likely affect relations which would come within purview of the GATT.

In this context it is relevant to note that soon after placing India on the priority list of Special 301, the US government notified the European Community as being on its 'priority watch list'—which is not quite the same as the 'priority list'—because of the alleged "barriers to entry of American TV programming embodied in the community's broadcasting legislation". Of course, the particular piece of offending legislation is scheduled to come into effect later in the course of the year. So the US move is a sort of advance warning.

But the point being made in Brussels is no different from that in New Delhi, namely, that the US moves are totally contrary to Uruguay Round understandings in regard to matters under negotiations. Whatever else the Uruguay Round negotiations succeed in realising, the resort to unilateral action must never be allowed, it does not matter how strong economically a party to the dispute is.

ASSAM

Justifying State Lawlessness

THE Supreme Court's decision to stay the Guwahati High Court judgment on the Armed Forces Special Powers Act's application in Assam adds yet another spark to the contentious issue of Centre State relations.

The Act itself has earned considerable notoriety during the last several years in the course of its use in all the seven north-eastern States, and of late in Punjab and Jammu and Kashmir. Initially introduced as a temporary measure in 1958, it has remained in force for the past over thirty years. A major amendment to the Act made in 1972 empowers the Centre to deploy troops into a State without the latter's consent. In an important judgment on March 20 this year, the Guwahati High Court challenged the Centre's right to declare the whole of Assam as 'disturbed area' under the Armed Forces Special Powers Act, which it did soon after the imposition of President's rule and the dissolution of the Assam assembly in November last. The High Court ordered the withdrawal of the Assam Disturbed Areas Act from 12 of the 23 districts of the State on the ground that 'there was no material to warrant the imposition of the Act'. A division bench of the Supreme Court has now stayed the High Court judgment and given the executive free hand to act without being affected by the High Court's order.

Although the Guwahati High Court judgment did not rule out the Armed Forces Special Powers Act, it upheld a part of the plea made in the batch of writ petitions that challenged the validity of the Act. It ruled that whenever the army made an arrest it must hand over the arrested person to the nearest police station within the shortest possible time and that such arrested persons must be produced before a magistrate within 24 hours of arrest. It further said that the army was empowered to arrest only such persons against whom there was some material to show that they were involved in a cognisable offence, but the army would not have the power to take each and every person into custody and thereafter release such innocent persons by giving them a clean chit. Significantly however, the Supreme Court division bench while staying the High Court order has asked the concerned authorities to obey the two above mentioned rulings made by the High Court.

Arbitrary arrests and defiance of the civil administration by the army have been regular features in every place which has been brought under the purview of the Armed Forces Special Powers Act. These issues formed the basis of the main arguments made in the written submission in 'Boothbar' vs Union of India, Civil

Rule No 11 of 1991 before the Guwahati High Court. It was pointed out by the petitioner who challenged the constitutional validity of the Act that the armed forces operating under the Act invariably committed serious cognisable offences in course of their arrests, detentions, interrogations, searches, seizures and raids. In the absence of any clear guidelines to ensure that the armed forces operate under the control of the civil administration, conflicts between the armed forces and the civil authorities are quite common. Investigation by competent authorities becomes impossible and the right of the accused to a fair trial is thus jeopardised. The police have in effect been deprived of their power to conduct investigations since they are not on the spot when the army arrest people and they get the custody of the arrested person several days after the arrest. Thus the provisions of the Act violate those specific provisions of the Code of Criminal Procedure which ensure basic safeguards against unreasonable restriction on the fundamental rights of the citizens.

It is unfortunate that the High Court failed to take proper cognisance of the other major arguments made in the petition relating to Section 4(a) of the Act which confers powers on junior non-commissioned officers to shoot to kill and allegations of torture by the army. The Attorney General's argument in defence of such draconian measures during the hearing before the High Court was that they are justified in the border areas to protect these States against 'external aggression and internal disturbance'. The implicit assumption behind this argument is that the unity and integrity of India relate only to its territorial boundaries without taking into account the fundamental rights of the people living in those territories. Unfortunately such reasoning seems to have entered into judicial decisions also

as even courts appear to ignore the plight of citizens of the border areas in the name of defending India's 'unity and integrity'.

ENVIRONMENTAL MOVEMENTS

Changing Status

LAST week the newspapers reported yet another case of police harassment of an environmentalist associated with the anti Narmada dam movement in Gujarat. A young environmentalist from Maharashtra, Chittarup Palit, who had gone to a police station in Rajpipla taluka of Broach district in Gujarat to enquire about the body of Manosh Skaria, a journalist who had recently drowned in the Narmada, was abused and manhandled by the police causing her physical injury and was then charged with disturbing a police officer on duty and with vulgar behaviour in a police station.

The incident is just one among many such that environmentalists in general and those in any way associated with the Narmada movement in particular are being subjected to in Gujarat. It is as if the police now regard all environmentalists as worse than criminals and are to be so treated. In this case for instance, there was a legitimate reason for the inquiry. Skaria's body had not been found even after several days of his death and the police had earlier been evasive about the incident pleading that it had taken place in an area which was under the jurisdiction of the Maharashtra police. The police seem to have attempted to browbeat Palit to obtain information about the movement and individuals in it. When she resisted these attempts she was threatened and abused.

It is not that the police are using new methods to harass environmental protesters; these are tried and tested methods in the police dossier having been used against the working class, the powerless

Giri Institute of Development Studies

Sector C, Aliganj Housing Scheme, Lucknow 226 020

Applications are invited from teachers and research scholars in social sciences (i.e. Economics, Sociology, Political Science and Geography) working in Universities and Degree Colleges in Uttar Pradesh, Madhya Pradesh, Bihar and Orissa for a two week ICSSR sponsored Research Methodology Course commencing from 21 June 1991. Interested candidates may apply through the Principal/Head of the Department or Institution giving full details of name, address, age, educational qualifications, teaching and research experience and the topic of research on which they are working/propose to work. Applications should reach the Director, Giri Institute of Development Studies on or before 31 May 1991. Selected candidates will be paid to and from Hind class Railway or Bus fare for attending the course. They will also be provided with boarding and lodging facilities during the training period.

Director

and the dispossessed for decades. What is significant is this: that so far, or at least till the beginning of the anti-Narmada and other environmental movements, the police had acted on the orders of 'higher authorities' in the government. And such action was usually taken only during particular mobilisations or events. But today, obviously, environmental protest and all activities associated with it have come to be regarded as anti-state activities *at all times*. The consequences of the internalisation of such a view of environmental protest has dangerous implications. This means for one thing that harassment of activists takes place without any reference to higher ups. It also implies that an important aspect of the democratic system, whatever its other limitations, the right to protest, is being effectively eroded even though the system may show no signs of damage from such protest—at least as yet. Given this, it is imperative that civil liberties activists everywhere, regardless of their stand on the particular environmental issue, whether it be the Narmada dam or the Koodankulam atomic power project raise the issue in public.

BANGLADESH

Compounding the Disaster

NATURE's fury may make no distinction between the rich and the poor. But clearly, the impact of natural disasters is much more intensely felt in poor nations—a consequence of their location—geographical, ecological and political—in the global environment. A tragic example is Bangladesh. Natural disasters have become a way of life there; the existence of a separate relief ministry is an illustration of this. And the recent devastating cyclone, many say the worst in over 20 years, brings into focus the many factors which come into play when a natural disaster strikes a struggling-to-develop country.

The cyclone—at least a storm severe enough to cause prime minister Khaleda Zia to adjourn parliament for three days—had been predicted. And yet even the experience of past disasters—there is not a year when Bangladesh has not experienced a cyclone or a severe storm, even though the damage has not always been as extensive—did not move the government to do more than this. While storm warnings were issued, there appears to have been no attempt to facilitate the movement of people away from the danger zones. Not that this would have been easy; people in the south-western coast are so used to storm warnings and are also so poor that they are not easily persuaded to leave their meagre possessions, their shelter and their means of livelihood. And even if they had been

persuaded, the government had not the machinery to physically move the thousands of people and to settle them in safer places. And again there probably was little indication of what might be 'safer' areas—a typical consequence of the limited systems of weather and storm forecasting in most Third World countries. Obviously the relief ministry in Bangladesh has functioned almost entirely as a set-up to facilitate the periodic routing of international relief funds rather than to take on such tasks as building up disaster-preparedness. But this time around the ministry appears to have failed in even this limited role—there have been reports of unnecessary wrangles between contending ministries on who is to take charge of the relief supplies coming in. That there is no emergency plan on how to swing various government departments into action in such a contingency is ominous, given that the coming monsoons will once again cause loss of crops, lives and livelihood.

Apart from the human misery, for Bangladesh the disaster means a massive economic set-back—standing crops have been destroyed and tillable land inundated with saline water; the export processing zone and especially the garment industry have been severely damaged and the country's major port, Chittagong, will need extensive restoration to function again. It is pertinent to recall that in 1988 in the wake of 'the worst ever floods in 40 years' then president Ershad had called for an urgent meeting of experts in the area from China, India and other countries to inquire into the causes of recurring floods in the country and had requested SAARC to convene such a meeting. In December 1990 such a meeting had indeed been convened, though not under SAARC auspices, with participation from international organisations to discuss an action plan drawn up by the World Bank for the control of annual flooding in the country, and to 'alleviate the devastation caused by the floods'. This plan had envisaged the institution of not only several pilot projects and studies on flood control and drainage, but also ecological impact studies, keeping in mind Bangladesh's delicate ecological balance. (The Bay of Bengal incidentally is reported to produce 10 per cent of the world's cyclones.) Nothing much has been heard of this massive project since then, though the current disaster will very likely revive it.

Clearly, caught in the trap of repeated disasters countries like Bangladesh have no choice but to become increasingly indebted to the North through the World Bank or other institutions and 'restoration of democracy' will remain only a phrase to be bandied about by political parties. If SAARC is to ever function as an alternate support system it is issues such as these which must be the focus of intra-regional action.

TWENTY YEARS AGO

EPW, May 8, 1971

The decision to appoint a cabinet minister in charge of planning portends a major change in the planning set-up—the first formal change of consequence since the appointment of the commission two decades back (the much talked of reorganisation in 1967 having amounted to nothing more than a change of members). . . Now for the first time, the tasks which were given to the Planning Commission have been formally assigned to the new ministry of planning. . . The prime minister did not say what role was envisaged for the Planning Commission in the new set-up it seems to have been assumed—perhaps correctly since it is difficult to conceive of two parallel agencies with exactly the same set of functions—that the commission will henceforth have a considerably reduced status.

The myth of an independent Planning Commission has obscured the fact, which should have been obvious all along, that the real, and in fact only, underpinning that planning can have is the commitment to it of the political leadership which means, in effect, the government of the day. That it is this commitment which makes all the difference could be seen in the virtual demise of planning towards the end of the Third Plan when the Central government under the late Lal Bahadur Shastri just simply lost interest in the whole business. Proof of a different kind may be seen in the sterility of the Planning Commission under the late D R Gadgil when it sought to assume independent postures *vis-a-vis* the government on matters which belonged to the realm of political decision-making (e.g., nationalisation of banks, industrial licensing policy).

★ ★ ★

One consequence of rapid branch expansion—a laudable achievement in itself—has been the high level of cash balances banks have maintained during the current year. . . Why did they lock up funds in idle cash? The answer lies probably in the rapid branch expansion and, even more perhaps, in the random pattern of branch expansion. . . Is it likely that the idea of fostering competition among the banks, especially the nationalised banks, has been carried a little too far? The case for competition in metropolitan cities and the larger towns—the biggest deposit and advances centres—is unquestioned, but need the principle be extended with the same vigour to backward rural areas which are being opened up to banking for the first time?

Higher Profit through Cost Reduction

Kumaran Pola

COASTAL PAPERS achieved a 55 per cent growth in net sales on annualised basis to Rs 16.41 crore during the year ended March 31, 1991. As shown by a lower expenses to sales ratio of 0.881 in 1989-90 compared to 0.941 in the preceding year, the company was able to achieve a drastic reduction in the cost of operations. Therefore, it could increase its operating profits by 144 per cent to Rs 2.39 crore and net profits by 321 per cent to Rs 1.60 crore. The company produced 15,059 tonnes of paper during the year as against 18,282 tonnes during the 18 month preceding period.

The overall return on investment more than quadrupled to 19.66 per cent during 1989-90 from 4.70 per cent during the preceding year. Behind this improvement

was the rise in assets utilisation ratio from 1.311 to 2.021 and an impressive spurt in the net profit margin from 3.59 per cent to 9.75 per cent. The company earned for its shareholders a return on owners' equity at 59.26 per cent in the latest year as against 30.40 per cent in 1988-89.

With the bolstering of the equity base on account of the ploughback of profits during the year, the proportion of debt in the capital structure of the company was brought down. Hence, the equity ratio stood lower at 1.191 in 1989-90 compared to 2.961 in the preceding year. The combined effect of lower interest charges on the one hand and higher operating profits on the other during the year was the spurt in the interest coverage ratio from 1.86 times in 1988-89 to 4.98 times in the

latest year. The short-term liquidity position of the company was also comfortable with a current ratio of 2.78 in 1989-90 compared to 2.44 in the preceding year. This was explained by considerable depletion in the current liabilities.

There was a funds-flow of Rs 2.08 crore during the year. Of the sources of funds, nearly 70 per cent was contributed by reserves and surpluses which increased by Rs 1.45 crore on account of transfers from profit and loss account. Increase in short-term loans on account of cash credit from banks contributed another Rs 0.22 crore to the sources of funds. The remaining sources of funds were the decreases in inventories by 0.32 crore and cash and bank balances by Rs 0.09 crore. The company utilised the funds in the following manner: decreases in current liabilities and provisions Rs 0.89 crore to liquidate bills payable, decrease in long-term loans Rs 0.72 crore to repay term loans from institutions and increases in net fixed assets by Rs 0.14 crore, receivables Rs 0.14 crore and miscellaneous current assets Rs 0.19 crore.

The company has promoted a new company, Riverdale Hotels, for which certificate to commence business has been obtained. In view of the expansion-cum-modernisation scheme already on hand, the implementation of the hotel project is being delayed. However, necessary steps for identifying required architects and consultants have been initiated for the project which would be implemented after taking final approval from ICICI.

Balance Sheet Analysis by Manisha Chhabra

IDL CHEMICALS

Setback Despite Higher Production

IDL CHEMICALS achieved a nominal 2 per cent growth in sales on annualised basis in 1989-90, it suffered a setback in profits and profitability. The net profits of the company declined by 27 per cent on annualised basis to Rs 2.78 crore. This happened despite the expenses to sales ratio remaining steady at 0.90.1 in both years. The quantity of high explosives produced increased to 24,759 tonnes from 17,416 tonnes. Net sales amounted to Rs 63.02 crore.

The overall return on investment declined to 3.90 per cent during 1989-90 from 5.93 per cent on annualised basis during the preceding period. The deterioration in the assets utilisation ratio from 0.951 in

1988-89 to 0.88:1 in the latest year and the worsening of the net profit margin from 6.22 per cent to 4.41 per cent acted jointly to push down the rate of return on investment. The company earned for its shareholders a lower return on owners' equity at 9.49 per cent during the year as compared to 13.72 per cent on annualised basis in the preceding period.

In view of the meagre accretion of funds from operations, the company was forced to resort to borrowing, both short-term and long-term during the year. Therefore, the capital structure showed a debt/equity ratio of 0.87:1 in 1989-90 as against 0.74:1 in the preceding year. This contributed to worsening of the interest coverage ratio from 3.07 times in 1988-89 to 2.32 times in the latest year. Nevertheless, the company improved its working capital position during the year, its current ratio going up to 2.78 from 2.44 in the preceding year. As against a nominal addition to current liabilities and provisions, substantial additions were made to inventories, receivables and cash and bank balances during the year thus improving the short-term liquidity position of the company.

The company experienced a funds-flow of Rs 6.71 crore during the year. The sources of funds consisted of increases in reserves and surpluses Rs 1.40 crore, current liabilities and provisions Rs 0.44 crore, short-term borrowings Rs 3.76 crore by way of cash credit from banks and fixed deposits and long-term borrowings Rs 1.10 crore. The company utilised most of the funds to increase current assets: inventories by Rs 1.63 crore, receivables by Rs 2.16 crore, cash and bank balances by Rs 0.33 crore and miscellaneous current assets by Rs 2.55 crore. A small amount of Rs 0.03 crore was used to increase net fixed assets.

The company has submitted applications for industrial licences for oil field chemicals, amines and refampicin. It proposes to implement a gypsum project through the associate company, Coromandel Gypsum, in Visakhapatnam.

NAV BHARAT FERRO ALLOYS

Sharp Rise in Costs

NAV BHARAT FERRO ALLOYS ended up with negative growth rates of 5 per cent in operating profits and 28 per cent in net profits in the year to March 31, 1990 despite a 25 per cent increase in net sales on annualised basis. Net sales reached Rs 76.98 crore and the operating and net profits earned amounted to Rs 5.79 crore

and Rs 1.56 crore respectively. The spurt in raw materials cost by 15 per cent, employees cost by 34 per cent, depreciation by 23 per cent and other expenses by 37 per cent, all on annualised basis, pushed up the expenses to sales ratio from 0.92:1 to 0.94:1. This explained the decline in profits during the year.

Production of ferro silicon during 1989-90 amounted to 19,431 tonnes as compared to 15,259 tonnes during the preceding nine-month period. The directors say that but for the frequent power shut-downs and power restrictions, production could have exceeded the licensed capacity of 20,000 tonnes. In the Pugalur sugar factory, the cane crushed during the year was 2.96 lakh tonnes resulting in a sugar production of 28,640 tonnes. This represented an average sugar recovery of 9.76 per cent. During the preceding year, the cane crushed and sugar produced amounted to 1.72 lakh tonnes and 16,498 tonnes respectively, with an average recovery of 9.71 per cent. In the marine products division, the company was able to export 305 tonnes of shrimps worth Rs 3.42 crore during 1989-90 compared to 252 tonnes worth Rs 2.83 crore in the preceding year. There were spurts in production at the Samalkot sugar factory complex as also the carbon dioxide division whereas the production of rectified spirit in the distillery was lower during the year.

The overall return on investment declined from 3.97 per cent to 2.54 per cent as there was deterioration in the net profit margin on sales from 3.54 per cent in 1988-89 to 2.03 per cent in 1989-90. On the other hand, assets utilisation improved as shown by the rise in the sales to assets ratio to 1.25:1 in 1989-90 from 1.12:1 in the preceding year. The directors could report only lower return on owners' equity at 12.04 per cent in 1989-90 compared to 18.16 per cent during the preceding period on annualised basis.

The setback in profits and the reduction in ploughback of profits to reserves and surpluses component of the owners' equity brought about a change in capital structure in favour of debt. The debt/equity worked out to 1.18:1 in 1989-90 compared to 1.08:1 in the preceding year. The fall in profits and the spurt in interest expenses led to worsening of the interest coverage ratio from 1.77 times in 1988-89 to 1.45 times in the latest year. The current ratio only marginally improved from 1.22 to 1.26 showing a more or less steady position in short-term liquidity.

The balance-sheet changes showed a funds flow of Rs 8.32 crore. The funds

were raised through increases in share capital Rs 0.36 crore, reserves and surplus Rs 0.63 crore, current liabilities and provisions Rs 3.35 crore, short-term borrowings Rs 0.43 crore and long-term borrowings Rs 1.94 crore. Decreases by Rs 0.94 crore in miscellaneous current assets and by Rs 0.67 crore in intangible assets were the remaining sources of funds. The long-term funds thus came through borrowings from institutions and banks. The company issued equity and preference shares to the shareholders of Andhra Foundry and Machine Company while amalgamating it with Nav Bharat Ferro Alloys. The company utilised the funds to increase various assets: net fixed assets by Rs 1.97 crore representing additions to plant and machinery, inventories by Rs 4.46 crore in raw materials, work-in-progress as also finished goods receivables, by Rs 1.42 crore, cash and bank balances by Rs 0.37 crore and investments by Rs 0.11 crore.

The company has obtained a letter of intent for the manufacture of 55,000 tonnes per annum of silico manganese in Madhya Pradesh and another for the manufacture of 15,000 tonnes per annum of high carbon ferro chrome in one of the company's existing furnaces at Paloncha intended for the manufacture of calcium silicide as a measure of diversification.

SBI CAPITAL MARKETS

Growth with Innovation

SBI CAPITAL MARKETS, the wholly-owned merchant banking subsidiary of State Bank of India, completed its fifth accounting year on March 31, 1991. In spite of a general slowdown during the year in the country's primary market activity and some uncertainties thrown up by the macro-economic and political scenario, the company closed the year on a successful note with all the key business segments registering good growth. Gross income at Rs 118.93 crore (Rs 68.75 crore) recorded an increase of 72 per cent. Profit before taxation was Rs 26.48 crore (Rs 21.73 crore) and after taxation provision of Rs 1.41 crore (Rs 3.67 crore) the net profit of Rs 25.07 crore was up by 39 per cent over last year's Rs 18.06 crore. Dividend has been raised from 18 per cent to 20 per cent on the enhanced equity of Rs 50 crore, raised from Rs 20 crore.

SBICAP continued to retain its pre-eminent position in issue management activity. During the year, it lead-managed 128 issues out of 264, the highest by any merchant banker, and helped mobilise

Rs 2,611 crore representing 77 per cent of the total amount raised. The only public sector bond issue to public during the year, viz, Indian Railway Finance Corporation's Rs 100 crore issue was lead-managed by SBICAP. The post-issue performance of the issues managed by SBICAP has also proved satisfactory. Over 90 per cent of the issues managed by SBICAP during 1987-88, 1988-89 and 1989-90 are quoted above par. Out of Rs 1,066 crore of privately placed bond issues handled by SBICAP, 68 per cent were placed with financial and investment institutions evidencing the company's significant placing capabilities.

In the area of loan syndications, the company completed 24 assignments aggregating Rs 245 crore. Further, SBICAP was mandated for syndicating a Rs 650 crore term loan, the largest ever syndication of term loan by banks in the country.

Leasing remained a thrust area during 1990-91 and total disbursements at Rs 79.73 crore were more than double the disbursements of Rs 34.35 crore in 1989-90. The lease income of Rs 24.80 crore recorded an increase of 82 per cent. With the signing of the US Exim line of credit amounting to \$ 10 million, the company would be able to extend lease finance for imported equipment in foreign currency. The company plans to diversify into hire purchase of industrial equipment in the current year.

In the area of Commercial Paper, where SBICAP has done pioneering work, out of the 36 issues authorised by RBI during the year, 24 were managed by SBICAP involving an aggregate amount of Rs 170.2 crore. SBICAP is also engaged in the trading of Certificates of Deposits issued by banks and total trading in 1990-91 was Rs 116.50 crore which showed a ten-fold growth over the previous year.

As part of advisory services, during the year, mandates were received for capital restructuring of three companies including two large public sector undertakings. Another assignment for restructuring the asset ownership of a company is under negotiation. SBICAP also acted as advisers to National Housing Bank in raising US \$ 25 m under US AID programme.

A second tranche of NRI bonds was raised during the year with SBICAP acting as managers to the issue. The total collections were in excess of \$ 260 million. This successful raising was accomplished in the face of a difficult market situation and lowered country rating for India. SBICAP continues to be the Indian adviser to India Magnum Fund, the largest privately placed coun-

try fund so far. The fund, being managed jointly with Morgan Stanley Assets Management of the US, has mobilised \$ 50 m (thereby taking the total of \$ 206 m) in the second tranche during the year. SBICAP is the sole investment manager of the India tranche of \$ 12 m, raised by Asian Convertibles and Income Fund.

SBICAP has evolved suitable implementation strategies in regard to privatisation of some public sector units, so that the process could be set in motion as soon as a final view on the subject is taken by the government of India.

SBICAP is the trustee and manager to SBI Mutual Fund. During the year, the Fund has continued to reach out to small investors, through a diversified product range. The number of investors under Magnum Schemes recorded a 75 per cent growth during the year, from 3,70,000 to over 6,50,000. Four new schemes were launched in 1990-91, the last of which is still on tap. In all, the four schemes are expected to raise about Rs 500 crore which would raise public investment in the Fund's domestic schemes to about Rs 1,100 crore. Of the new launches, one was the Magnum Multiplier pure growth scheme, aimed at meeting the long-felt need of SBIMF investors for this type of product.

IPCL

Many-Sided Growth

INDIAN PETROCHEMICALS CORPORATION's turnover in 1990-91 moved up 12 per cent to Rs 1,325 crore while gross profit was Rs 259 crore, according to provisional figures. During 1989-90, IPCL's turnover had a larger share of traded goods at Rs 217 crore (18 per cent), which was Rs 134 crore (10 per cent) during 1990-91—a drop of 38 per cent. As against this IPCL's own products' turnover went up from Rs 962 crore to Rs 1,191 crore—a rise of 24 per cent.

IPCL's Baroda complex achieved a capacity utilisation of 91 per cent, not counting the xylenes plant which was constrained severely by feedstock availability. An all-time high production level was recorded, 13 per cent higher than in the previous year. Additional production was of the order of 45,000 tonnes compared to the previous year. On the energy conservation front the Baroda complex reported a reduction of 4.5 per cent with a specific energy consumption of 7.41 million KCal/tonne. This is equivalent to a saving of Rs 8.5 crore.

However, IPCL's Maharashtra gas cracker complex (MGCC) at Nagothane had an accident in November 1990 which has put its commissioning behind schedule by six months and led to a loss of Rs 37 crore by its non-operation. Efforts are on to put MGCC back into operation by May 1991.

The CATAD division of IPCL at Thane, which was consistently a loss-making unit acquired from a private sector company in 1987, was made profitable. This was achieved with an emphasis on speciality catalysts like isomerisation and reforming in its product mix and bringing in synergy between IPCL's research base and CATAD.

IPCL's proposed third petrochemical complex at Gandhar is expected to be cleared by the Public Investment Board. This Rs 2,915 crore gas-based complex in Bharuch in Gujarat would have a composite plant for supply of C2/C3 feedstock, to be jointly implemented by IPCL along with GAIL and/or ONGC. Apart from pioneering a new generation of chemicals such as alpha olefins, alcohol ethoxylates and primary alcohols, the Gandhar complex will be unique in its planning for a total area development programme, local technical and entrepreneur skill development and infrastructure development.

The joint-venture proposal for engineering plastics between IPCL and General Electric Plastics of Netherlands received government approval during the year. A 50:50 equity participation, the Rs 700 crore joint venture will bring to India revolutionary engineering plastics used in defence, security, business machines, etc.

IPCL's 4.4 million contract, signed this February with the National Petrochemical Company, Iran, for training 300 personnel from Iran, in the first phase, signalled IPCL's entry into overseas contracts. The understanding with NPC, Iran, also covers working on a joint venture. A committee has been appointed to examine the Iranian joint venture offer. A separate petrochemical joint venture on the anvil in West Asia made further progress during the year.

1990-91 also saw IPCL entering the field of speciality fibres with its 12 tonnes/year pilot plant for carbon fibre going into commercial production. This research-based facility places India on the world map of producers of strategic material used in defence, aerospace, artificial implantation, etc. The first consignment for the defence research programme was made on March 30.

Who Is Afraid of Bank Disclosure?

D N Ghosh

The current initiatives towards reform of the financial system are mainly in the form of diversification of money market instruments and establishment of new agencies for widening and deepening the range of services in the financial market. These reforms cannot, however, correct the inherent systemic deficiencies in the core area of financial intermediation. Far more effective will it be to use the instrument of fuller public disclosure to put financial institutions to the test of the market-place.

IN the recent public issue by the ICICI, sharp questions were raised on the inadequacy of financial disclosure in the prospectus. Financial journalists were persistent in the assertion of their right to be apprised of the quality of the asset portfolio and the order of provision against bad and doubtful debts. The true state of affairs of the banks and financial institutions has become matters of serious public concern. There are uncomfortable signs of faltering confidence in the strength and viability of the system.

The banking system enjoys a somewhat privileged status, thanks to the time-honoured convention of preserving the confidentiality of the operations of its clients. It is widely believed that the plea of confidentiality is over-stretched in the name of preserving the delicate fabric of credit. Data released by different institutions are too meagre for any informed and discriminating judgment on matters of financial soundness, asset quality, prudence in management of funds, efficiency in payment mechanism and reasonableness in cost of financial intermediation.

What is available to the public is the balance-sheet and the report of the auditors on the balance-sheet. This is subject to several limitations. A bank is debarred from disclosing its total income. A fine print in the appendix to the Banking Regulation Act prescribing the format of the accounts gives it the special sanction that the income be shown after deducting the provision for bad and doubtful debts and what it has provided is not required to be disclosed.

Yardsticks for making provision for bad and doubtful debts are not uniform: they vary widely and significantly as between different institutions. To mention a few issues by way of illustration: At what

point should the bank treat a debt as bad and doubtful of recovery? If the schedule for the repayment of principal and interest is not adhered to, does it automatically become a non-performing loan? If the loan is rescheduled to take into account the borrower's fluctuating fortunes, could it count on the benefit of doubt? Again, if there is adequate security cover, is the bank obligated to make any provision? Also, availability and realisability of any specific security gives scope for wide divergence of views. Differences between management and auditors on these complex issues come to be incorporated discreetly in the notes forming part of the accounts. Drafted carefully and skilfully, the notes protect the auditors and at the same time do not damage the credibility and image of the bank. It is virtually impossible to cut through the camouflage to interpret the true underlying trends.

While ICICI did not disclose its provisions, it pointed out, and rightly so, that no single institution could afford to take a unilateral decision in the matter, but that ICICI would be fully prepared to disclose its affairs provided all banks and financial institutions opened their books. Disclosure requirements and standards have always evoked lively interest among academicians, financial journalists and public regulatory agencies in the developed countries. Surprisingly, there has been no structured and informed debate and discussion in India. The criteria for judging non-performing assets, quantification of provision, the extent and standard of disclosure—all these are matters which call for reconciliation of conflicting views and adoption of a uniform code and convention.

What should be the object of such a code? Transparency in the matter of provision for bad and doubtful debts is not

an end in itself. The central issue is to enhance the operational and functional efficiency of each unit in the financial system. The range and depth of disclosure must be designed to put all the units in the system on the reform path towards greater efficiency.

The current initiatives towards reform are mainly in the form of diversification of money market instruments and establishment of new agencies in the public and private sector for widening and deepening the range of services in the financial market. These reforms cannot, however, correct the inherent systemic deficiencies in the core area of financial intermediation: its cost, archaic payment mechanism, outdated system and technology, deteriorating asset quality and growing incapability to absorb risks are clearly matters of serious concern. It is naive to assume that infusion of private ownership in the public sector banking units, which goes generally by the name of privatisation, will necessarily remove some of the major deficiencies which are not linked to the ownership pattern. It is crucial that each unit is put to the test of the marketplace and this may be initiated through the disclosure route. Each unit will be driven to reach certain efficiency parameters to keep it strong, stable, viable and competitive as well as to comply with the regulatory requirements of the monetary authority. The pressure and forces that will thus be generated will set in motion the adjustment process. The managerial responses of each unit will markedly differ, depending on their respective financial position and the nexus with its customers and other players in the market. The adjustment process will acquire its own dynamics. One cannot, therefore, unambiguously predict or chart out the trajectory of the adjustment process. It is not unlikely that the viability of the non-competitive institutions may be threatened, particularly those in the public sector that have long enjoyed protection from the authorities against any rough environment. If disclosure tends to trigger a crisis of confidence, the authorities should step in, but such a contingency, even if likely, should not be an argument for shying away from using disclosure as the key to reform and holding back the adjustment process.

For the adjustment process to be smooth, the market participants would legitimately expect a level playing field. Certain minimum preconditions have to

be ensured. Each unit must be allowed the requisite freedom and flexibility to operate as an independent decision-maker in the matter of earning, liquidity, asset quality and cost of intermediation. Second, the subsidy element in the directed lending programmes must not be a charge on its profits: this has to be reimbursed explicitly from the budgetary resources, even if the public sector banks continue to be the vehicles for such lending. (This is not something novel in public sector banking; in the case of the State Bank of India, the losses attributable to the branches opened at the behest of the government used to be reimbursed to it from a special fund.) Third, adequacy of capital in relation to the risk-weighted assets must be brought to internationally accepted standards.

Given a consensus on the goals to be achieved and an understanding of the current conditions, the regulatory authorities will have to induce appropriate goal-adequate behaviour.¹ Their rules of the game have to change. They have to develop and sharpen their response and listen to the market and fine tune the nature and quality of intervention to correct any destabilising influence. This would demand not less but more watchful regulation, not less but more frequent interaction with the actors in the market, not less but more guidance in complex situations, but overall, less interference in the managerial decision-making process.

Can we succeed in embarking on the route to reform? Each of the groups concerned with the operation, management and regulation of the system has a vested interest in the preservation of the *status quo*. Bank managements, employees, the industrialists, the politicians and the regulatory authority—all have an interest in preserving the fine print and in shielding the banks from full public gaze. The system is becoming too flabby without any commensurate increase in productivity and efficiency in the payment and money transmission mechanism. The true cost of intermediation, if it comes out, could perhaps be a serious indictment of the management and the employees. Default is reported to be rising to a dangerously high level. Emotive debates are taking place in the financial press: who holds the system to ransom—the industrial or rural borrowers? There are no hard facts to go upon, only prejudices or surmises. Industrialists certainly would not like to expose the level of their overdue commitments, the non-disclosure provision and the confidentiality convention of industrial transactions come in handy

for their comfort. For rural credit, virtually on the brink of collapse, truth will be far too unpalatable for politicians. Will the regulatory agencies welcome disclosure? Perhaps not. Over the last forty years, parliament has been generous in granting statutory powers to the Reserve Bank as and when needed and asked for. Supervision and inspection by the Reserve Bank have been generally accepted as the impregnable shield against erosion of the net worth of the banks. Will disclosures wreck this confidence?

Interestingly, this is a situation similar to what has been analysed by Kornai in his study of market socialism in Hungary, Poland and Czechoslovakia in the early sixties. Note his perceptive observation on the common experience of these countries:

Reform could not be pushed through as it turned out that neither the bureaucracy, nor the management, nor indeed the workers were enthusiastic adherents of competition or of the marketisation of the state-owned sector. Some enlightened government officials and intellectuals may have come to the conclusion that a hardening of the budget constraint and a decrease of paternalism was needed so as to improve the performance of the economy. However, there were no strikes

or street demonstrations in favour of increasing efficiency at the expense of state protection. There did not exist a grassroot movement for the decentralisation of the state-owned sector.²

The undercurrent for the maintenance of *status quo* is strong and persistent. The management would not wish to expose themselves to the charge of inefficiency, the monetary authority for the ineffectiveness of its supervisory role, the industrialists for subverting the system for their own benefit and the politicians for encouraging defaults for favouring their own vote-banks. Seemingly, an 'unholy alliance' to preserve the mystique of the 'holy secret'.

Notes

1 This is to be interpreted within the framework of the methodology of 'instrumental influence' or 'instrumental analysis' as discussed by Adolph Lowe in his seminal work *On Economic Knowledge: Towards a Science of Political Economics*, New York, 1965.

Poverty and Income Distribution

Edited by

K S Krishnaswamy

While there has been, over the years, a perceptible increase in per capita income and expenditure and possibly some decline in the incidence of poverty in India, what still remains is massive and of a kind that is not remedied quickly or smoothly. Even with radical policies, the shifts in income and occupational structures to make a serious dent on it will take more than the rest of this century. In the welter of recent exchanges between the government and the opposition as well as between planners and market advocates on the strategy of growth, these issues, have been largely obfuscated. It is therefore more than ever necessary today to recognise the magnitude of the problem and the inadequacy of the measures adopted so far to deal with it.

Peacocks of War

Deena Khatkhate

The annihilation of life in the Gulf war takes one's mind back to Dresden in Germany where 35,000 people perished in British bombing in February 1945. The tragedy lives on in Wilhelm Lachnit's painting 'The Death of Dresden'

WE are not Benjamin Franklin with his virtues and statesmanship to pronounce that "there never was a good war and a bad peace". His times were different from ours. This is an age where there is both a bad war and a bad peace. Even if a war is started by a bad man and a good man joins it, it does not become a good war. This war which exploded on January 16 is certainly not one of that genre, and the peace that may break in after the carnage and cruel exhibition of modern destructive weaponry is not likely to be good either. In the meantime, business will be as usual, with a few kings, some sheikhs and maniacs shuffled around. Saddam Hussein, foolish and vain, menacing and Mephistophelian is counting his days but those who would come in his trail would be more of those ruthless demonic personalities who will preside over the generation of meaningless deaths in the Middle East. Why this horde of carnivores? Why this death dance? Why this lying when you are already dead—not only physically but culturally and historically? Today it is the defence of Islam, tomorrow it is the espousal of Shiaism and it is the honour of the Palestinians the day after tomorrow. But the enemies are not neatly defined. The other day the Shias were at the throats of the Sunnis, then they together were ranged against Jews and now those who lacerated the sky with 'Islam in danger' are fighting each other.

The enemy of Arabia is within itself. Iraqi poet Abdul Bayati famed for his prophetic vision, lamented that "he dreamt of democracy and peace in his land and that sounded right". After three score and ten years, he gave up—going through disillusionment, prison tortures and a perpetuating mendicancy. Not being a fatalist, he fastened the blame for this tragedy on to his leaders. The defeat in the Middle East wars, he ruefully says, is the defeat of "these peacocks" who were left behind.

A generation of meaningless deaths
In the coffee houses of the East we are
defeated by the war of words

The peacocks who strut in the halls where pride is dead

And the essays of the obedient hacks

But the peacocks are not only in the Arab world. They are here too in good measure. The peacocks with their colourful plumage do not see the ravages of war. President Bush, a war leader now with an approval rating of 80 per cent, is riding high on popular acclaim. 'Cost in lives during war is beyond the administration to measure in the same way as the cost of not resisting aggression is beyond mankind to imagine,' he thunders. Yes, how can you measure the cost of war? On television, there is an awful display of modern electronic weaponry with night vision contraptions, patriot missiles, and precision instruments which wipe out miles and miles long rows of houses and factories. How can one add up the unimaginable amount of dollars sunk into the manufacture of this weaponry? No, no one can measure the cost of war whether it relates to weaponry or human lives. Men, women and children just melt into a thickening liquid. In Saddam's Iraq they are dragged out of their homes without knowledge of their parents. In Bush's America they are just called in, if they at any time had used military service as an interim arrangement to support their education or families. And then how can you measure the cost of tears, the emotional devastation that is wrought on the families of men and women on the war front. There is a picture on television of a young girl, newly married, bidding goodbye to her young husband going to the front. Tears roll down but more tearing are her words, "But whose war are you fighting?" The distraught father, seeing off his son, about to be a doctor and an only bread-winner, saying to his departing son, "I don't believe in this war, but you can't avoid it." There is a dairy farmer, whose husband is a reservist called for duty in the Gulf. Being a reservist, he had to forgo his income. When asked how she copes with the loss of income following her husband's departure, the wife, pale and wan, pointed to her ailing father who

is helping her in milking the cow and broke down sobbing. Yes, this is the cost which is beyond the administration to measure but certainly not beyond mankind to imagine. As Bayati mused, "We are the generation of meaningless deaths", which is cost less for the peacocks who rule the destinies of modern nation states.

But it is not all doom and gloom, there are some oases of bloom—of daredevil soldiers, upright journalists and public men of conscience. Death in the Desert Storm is staring at them, the uncertainties of the morrow are unnerving them, darkness of the night is enveloping them, the sand dunes of the sprawling desert are taking them into the bowels of the earth, but the soldiers, the foot soldiers on the battlefield, singing and dancing, regale themselves with a vision of their fiancées, dream of their future happiness.

Come eh come eh
You the beautiful one
But if you don't find me here
Then let us meet in heaven

One scene fades out and another fades in with a young black soldier struggling to call his mom on the emergency phone. He shouts, "Hi mom, I am Robert, what are you cooking now? Please remember me when you eat my favourite dish. Let me tell you how grateful to you I am for bringing me in this world. If I die now, it is because I lived well under your care. And mom, I made my peace with my dad." Then he laughs and laughs till he breaks down. No, these are not the costs which can be calculated by mankind or even by gods.

It is not war if there is not disinformation or misinformation. Dreading a free media, the Pentagon did not allow non pool arrangements for journalists to report the war news. But one Peter Arnett, an intrepid CNN television correspondent, braved all these adversities and stuck to his mission in Baghdad to relay pictures of war devastation in Iraq and the killing of civilians. He was scrupulous enough to add that his news coverage has been cleared by the Iraqi authorities. But he did not shirk, even within those bonds, from announcing to the world what Allied bombing was doing in that country. But Republican senator Alan Simpson has flung a verbal scud at him, saying that he is doing a dirty propaganda job for Saddam Hussein. However, this verbal scud attack at Arnett has been repelled by most leading journalists with 'unpatriotic' missiles. In the process they have exposed

senators' cupboards. Simpson, when he met Saddam Hussein a few months ago, had told him that "the frightful things being said about you and your police state must be the work of a maligned press. I believe your problems are with Western media and not with the US government." Another, Howard Metzenbaum, had assured Saddam, "after listening to you for about an hour, I realised that you are a strong and intelligent man and that you want peace". It is these men-peacocks, as poet Bayati described them, who flaunt their colourful plumage rather than those fearless journalists, who disseminate the truth, who betray their people and egg them on to the abattoirs of war. During such traumatic times, the best in men and women surfaces and it is before this that one bows one's head and pays homage to a free and democratic society. Is such an act by a journalist conceivable in India, which boasts of truth, non-violence, and high moral values? It is high time some Indians jog their memories hard to recall a forgotten Bengali journalist who exposed the hollowness and falsity of the reams of paper prepared by the Historical Divi-

India's claim on McMahon Line.

A war without destruction of life and property would not remain war and yet, when you see the bodies of women and children dumped in broken bunkers, your soul cries for those innocent people who escaped from the living tyranny of one misanthrope into the silent cemetery of another. Only those who survive them mourn them; for them, it is like another day. With such annihilation of life, one's mind harks back to another place and time—Dresden in Germany in February 1945 where 35,000 people perished under British bombing. The tragedy lives on in a painting by Wilhelm Lachnit called 'The Death of Dresden'. There is a figure of death and a mother sitting side by side, their heads collapsed into their hands, the ruins of the city stacked behind them in the spoiled light and a powerless sun. The mother's son stares out from the picture, his small hands draped over the mother's lap, palm facing out, towards what remains. The peacocks of the world with their plumage of glorious and gory colours have always left behind such paintings for eternity.

political party in power, unless party affiliation is an appropriate requirement for the position involved. The present case concerned "low-level public employees". The court ruled that it was unconstitutional to apply any political patronage practice to them.

The US has a spoils system in public services. But there exists also the permanent civil service. This case concerned the latter. It is relevant to us for two reasons. One is that since we do not have the spoils system, the reasoning is of greater force. The other is that we also have the constitutional guarantee of free speech, Article 19(1)(a) of the Constitution.

The governor's order affected 60,000 State posts. Each year there were around 5,000 vacancies. Requests for the governor's "express permission" became routine. Political patronage policies are "tantamount to coerced belief". A situation is created in which the public servant is forced to accept the political beliefs of his political masters in order to further or protect his interests—a committed civil servant. As the court put it in an earlier case, "the coercion of belief that necessarily flows from the knowledge that one must have a sponsor in the dominant party in order to retain one's job".

The court rejected the argument that the patronage system was necessary for the political process to work. "Political parties have already survived the substantial decline in patronage employment practices in this country." Rejecting all the defences advanced in justification of the practice, the court ruled: "We, therefore, determine that promotions, transfers, and recalls after lay-offs based on political affiliation or support are an impermissible infringement of the First Amendment rights of public employees."

Viewing the situation realistically, the court observed: "A state job is valuable. Like most employment, it provides regular paychecks, health insurance, and other benefits. In addition, there may be openings with the state when business in the private sector is slow. There are also occupations for which the government is a major (or only) source of employment, such as social workers, elementary school teachers, and prison guards. Thus, denial of a state job is a serious privation."

In 1966 the court had struck down loyalty oaths for public servants. One argument given in the minority judgment deserves mention. How can the Supreme Court frown upon political appointments when the judges of the court themselves are appointed on political considerations? This shows the political polarisation in the US Supreme Court. It is not an example for emulation but a warning to be heeded.

CIVIL LIBERTIES

Protecting Public Servants from Politicians

A G Noorani

A ruling of the US Supreme Court that it is unconstitutional to apply any political patronage practice to government employees in initial employment, promotions, transfers or dismissals is of particular relevance to us.

THE Constitution, which prevents the abuse of public property for political or personal ends, protects public servants too from attempts by politicians to suborn their loyalties, or make them insecure in order to force them to lend their services for political ends. The United States Supreme Court's ruling in *Rutan vs Republican Party of Illinois* on June 21, 1990 is a landmark. It is of particular relevance to our situation.

The governor of the State of Illinois issued an executive order instituting a hiring freeze, whereby State officials were prohibited from hiring any employee, filling any vacancy, creating any new position, or taking any similar action without the governor's "express permission". The object was obvious. An applicant for employment, employees who had been denied promotions or transfers, and former employees who had not been recalled after lay-offs filed a suit alleging that by means of the freeze the governor

was operating a political patronage system. He wanted to employ or promote supporters of the Republican Party. This, they argued, violated the First Amendment—the guarantee of free speech.

The District Court dismissed the suit on the ground that it disclosed no cause of action. The Appeal Court reversed in part. It protected officials against dismissal, but not applicants rejected for political reasons.

The Supreme Court split 5 to 4 and upheld the plaintiffs' claim. Given the change in the composition of the court since in favour of the conservatives, it may be that the case would have been decided against the plaintiffs today. All the same the majority ruling is law.

Recalling two earlier rulings of 1976 and 1980, justice Brennan, who delivered the majority judgment, said that the court had decided that the First Amendment forbids government officials to discharge or threaten to discharge public employees

Eighth Plan: Challenges and Opportunities—XV

Epilogue: Towards Sustainable Development

Arun Ghosh

As the country prepares itself for another general election within eighteen months and as a new government (and presumably a new Planning Commission) is about to take over the task of formulating the Eighth Plan, the social transformation that was to inform the Eighth Plan approach approved by the National Development Council in September 1990 will have to be kept in mind by all those concerned with plan formulation and implementation. Last of a series of articles discussing the broad approach of the Planning Commission under the V P Singh government.

IN order to attain sustainable development, we need to satisfy three basic requirements. First, we need self-reliance not only in the matter of external payments, we need a spirit of self-reliance among the masses of people. Secondly, and in order to bring about this spirit of self-reliance and self-confidence, we need to focus on the problems of the poor, particularly in the rural areas, focus on the Scheduled Caste and Scheduled Tribes people, focus on the education, emancipation and development of women. The Right to Work would in effect ensure a minimum of income for every family, which is the first step to a more egalitarian pattern of development. Finally, we need to provide for a minimum of energy supply as well as potable drinking water for every citizen, so that our women and children can be freed from the drudgery of daily collection of fuelwood and drinking water for the very survival of families.

RURAL DEVELOPMENT SUMMING UP PROBLEMS

The problems of the rural poor and rural productivity are complex, and largely inter-related. Even though in percentage terms, the number of people below the poverty line has been declining, the absolute number of the poor is staggering. The Scheduled Caste and Scheduled Tribes people constitute the core group in this category. Equally distressing is the predominance of women among the poor, the uneducated, the socially backward. High rates of population growth are correlated with high infant mortality, lack of education, lack of nutrition, lack of health care services and housing. All these factors are also associated with meagre incomes. The social and economic deprivations afflicting the poor reinforce each other.

Rural development and improvement of the conditions of life as well as productivity of the rural people have therefore to be at the core of the overall development strategy. The emergence of the poor from their pover-

ty would not only temper the gross inequalities prevalent today—a major factor in social tensions—the increase in effective demand of the poor could be instrumental in bringing about a self-reliant, sustainable growth of the economy. At the same time, if the productivity of this vast reservoir of human power could be raised, the potential for the growth of output—and therefore of the rate of growth of the economy—would be vastly enhanced. Also, not only would the investment requirements for such growth be much less than for the path of development pursued during the eighties, the time lag between outlay and increased output is likely to be relatively much less. An important consideration in this context is that such development makes little demand for the import of goods and services, unlike the modern industry sector or diverse urban services and facilities. The lag between outlay on social services and a rise in the quality of life could be much shorter if we can avoid fragmentation of these services.

Obviously, diverse interventions aimed at rural development and diminishing poverty and raising rural employment, incomes and productivity must be mutually consistent; these policies must also be supported and strengthened by overall development policy. For example, education, primary health and child care services and nutrition programmes must all be welded together purposefully; this is an example of the mutuality of these strands of social policy which are today fragmented because of the exercise of departmental prerogatives. Textile policy is an example of the meshing of overall development policies with the rural development programme; this policy would, *inter alia*, reduce the energy intensity of our development programme, and the same applies to the focus required on organic fertilisers for providing the soil with nutrients for raising agricultural productivity. Improvement of agricultural productivity depends on the integrated management and

use of land, water and vegetative cover, regeneration and conservation of natural resources, together with timely and systematic inputs in the form of credit, technical advice and marketing support.

Thus, quite obviously, the nature and range of problems that the rural poor face require a holistic solution. The approach so far has been piecemeal and verucally compartmentalised. Hence, despite the many government interventions, the backwardness of rural areas has not only remained, it has accentuated the disparities between productivity and living standards between regions. The employment programmes (pace the Jawahar Rozgar Yojana) have been supplementary, superimposed on diverse fragmented programmes of different departments. All rural development programmes in the past have been expenditure-oriented, and have therefore failed to make any long lasting impact on the productivity of the rural population generally.

The people, the rural populace in particular, have also been excluded from participation in the planning or decision-making process, even in matters which concern them (and their habitat) directly. Development effort over the past 40 years has not been able to harness—except in a few States—local knowledge, experience and resources, or the energies of the people. There has been exclusive reliance on the official machinery to combat the complex (and interrelated) problems of unemployment, poverty, low productivity and social and economic disparities (There are a few isolated pockets where a few voluntary organisations have been able to make a better impact, but such experience has obviously been limited.)

The problems that we face today are formidable. There is today no systematic scientific, technical, professional, multi-disciplinary underpinning of local rural developmental programmes. There has been little attempt to learn from past successes and failures. There has been no effort to co-ordinate official interventions with the efforts of many voluntary organisations that are reportedly doing useful work, albeit such efforts are necessarily highly localised and limited. One reason for the unsatisfactory results of government intervention has been the exclusive reliance on the administrative machinery to implement measures intended to promote equity. These efforts have also, in places, been thwarted by an unholy alliance between the official machinery and vested interests. Indeed, even existing legislation like tenancy reforms, freeing of bonded labour, payment of minimum wages to agricultural workers, abolition of untouchability, all have remained laws on paper. There has, in fact, been gross violation of civil liberties and of ordinary law and order through atrocities committed on certain castes, communities and women.

Schemes initiated from above, even where

local needs and priorities. There has been little or no local area planning. This by itself has led to considerable waste of scarce resources, to leakages and corruption; and as indicated earlier, has resulted in the delivery system absorbing most of the funds currently earmarked for socio-economic development of the rural areas.

Administrators are prone to measure success by time-bound 'expenditure'. Because of the ease (for the officials) of interacting with the existing hierarchy, economic disparities have increased sharply, even after 40 years of planning. Only seven States, namely, Andhra Pradesh, Bihar, Madhya Pradesh, Maharashtra, Orissa, Tamil Nadu and Uttar Pradesh, account for 80 per cent of those below the poverty line and 70 per cent of the unemployed population in the country. 70 per cent of the cultivated area is rain-fed, and has low productivity.

A distressing consequence of the lack of genuine, integrated planning at the micro level (for each local 'watershed' area) has been the wanton abuse of precious natural resources. In the absence of democratic decentralisation, the local population has little say in the matter of exploitation of natural resources. Many large development projects have inflicted serious, and frequently irreparable damage on ecology and the environment, destroyed natural resources, displaced lakhs of persons, and rendered them homeless and without any means of livelihood.

The focus, in short, has been on sectoral planning rather than on area planning. There has been a steady (and unabated) tendency to over-centralise and bureaucratised rural development programmes. During the Sixth and Seventh Plans in particular, there was enormous expansion of Centrally Sponsored Schemes, and concentration of planning (even in matters of detail) and implementation of plans in the hands of the official machinery. Progress on the rural front has been thwarted essentially by over-centralisation, bureaucratisation, and fragmentation of programmes.

DEMOCRATIC DECENTRALISATION

The Eighth Plan approach of the erstwhile Planning Commission was to aim at the maximisation of employment. The focus was to give practical meaning to the notion of the Right to Work. Special focus was on the development of women, their education, their health and nutrition, their work opportunities for ensuring a minimum level of income, maternity and child care—all of which may be expected to curb population growth and to raise the quality of life.

The first step in this direction is decentralisation of the planning process, involving not only a reorientation of priorities (in each area) but also in the processes and mechanisms of plan formulation and implementation. Such reorientation requires democratic decentralisation of the body politic. This would provide greater scope for the active participation of the people,

of local government (from the village panchayat—overseen by the Gram Sabha—to mandal/block panchayat and on to the district level). This process would provide an incentive to mobilise local resources, and to shape the development programme of each area to serve better the needs and priorities of the people. This calls for a fundamental policy change, and a restructuring of decision-making and planning processes, and of the machinery for implementation of the programmes.

The first requisite in this endeavour is clear recognition of the federal principle. The Centre must learn that India is a Union of States, that it is not for a few power-brokers at the Centre to decide on the fate of the diverse groups of people of this country. Those who have been using violence—through the use of para-military and other special forces in charge of 'internal security'—in the name of national integrity are indeed causing deep fissures within the community by the wanton repression of local urges and local aspirations. Firm acceptance of the federal principle, and within each State, of the concept of democratic decentralisation, is the greatest need of the hour.

Decentralisation has to be accompanied by the introduction of area planning. Area planning on an integrated basis will release the untapped energies of the people and local resources. It will also help to release development programmes from the stranglehold of standardised 'schematic' projects conceived either at the Centre or State (bureaucratic) levels. It would obviate the wastage of resources inherent in the present fragmented scheme-wise (or department-wise) programmes meant for local development.

Decentralisation and area planning are also pivotal to the underpinning of the employment programme. Since the removal of unemployment was the principal goal of the Eighth Plan—the growth rate being a fall-out of greater employment at higher levels of productivity—the sincerity and purposefulness of the government would be on test in regard to the implementation of the concept of *Right to Work, at the official minimum wage, for eight hours every day*. This work will have to be generated by the economic system through appropriate economic and technology policies on the one hand, and building up the requisite operational system, on the other.

The operation of work guarantee during the transition to full employment will require an effective institution in every village/town, responsible for planning, organising and providing productive work (or facilitating work opportunities) on a sustained basis. Specific works will be required for the implementation of area development plans. These in turn will generate new work opportunities at higher levels of productivity. It is essential for the success of the programme that the responsibility, authority and the resources for planning and implementation of such works be entrusted to the micro-level

to both draw up the local area development plans and provide work to those seeking employment. The local bodies will have to be endowed with adequate back-up support by way of experts, in order to formulate comprehensive area plans for each village or town.

It will obviously be necessary in this context to minimise inefficiency and the wastage of resources inherent in departmentally-run, segmented services. It will also be necessary to devolve the requisite funds to the panchayats (or other local bodies like the municipalities). Thus, the large transfers being made today (under Centrally Sponsored Schemes) will become investment-oriented instead of being expenditure-oriented (as they are today).

Overriding priority has therefore to be given to building the requisite institutions and mobilising institutional resources. Rural development funds need to be entrusted to the democratically elected representative decentralised institutions, instead of the sectoral official departments. The role of the government is to be reduced to one of aiding and complementing the process of people-led development in the rural areas.

Incidentally, there are many people who feel sceptical about such devolution of authority. Their reasoning is: (a) that in the absence of land reform, the panchayats are likely to be hijacked by vested interests in the rural areas, and the funds used for benefiting themselves; and (b) that this process will unleash corruption in the implementation of rural development programmes.

Both the above arguments are incorrect. Those who argue that land reform should precede such devolution forget that extant land reform laws have not been implemented in most states, and are unlikely to be implemented without pressure from below; that such pressure will come from democratic decentralisation because: (a) local people are more aware of what happens locally than of the goings-on in a distant State capital; and (b) increasingly, the build-up of diverse activist groups is going to make it difficult for a few vested interests to really hijack the panchayat system to serve their interests. It must also be accepted unfortunately that for some time, this can and will happen in certain localised areas. But with the present revolution in communications, the news of the success stories will spread fast; and activist groups may be expected to help spread the message.

The example of the Karnataka experiment of 1986 is proof of the innate wisdom of the people in regard to their own welfare. The recent subversion of the panchayat system has come from the State-level politicians in Karnataka: this had also been the experience of Gujarat and Maharashtra in the sixties. The State-level leadership sees in the growth of the panchayats a threat to its power and authority. This has to be exposed by an upsurge from the ground level. It is possible that there would emerge violent overt op-

position to the new system in some areas. What we forget is that there is constant, unrelenting repression going on today in any case, and that a few eruptions of violence is but natural in a process of social transformation that is likely to be fundamental. No one likes to shed power voluntarily or willingly.

To recapitulate, a three-fold strategy for rural development is recommended for the Eighth Plan, comprising:

- (a) democratic decentralisation;
- (b) area planning, and
- (c) convergence of social services, with a revised role of government.

INSTITUTIONAL RESOURCES

The institutional resources for development will include, among others: (a) panchayats (and where appropriate, duly elected municipal bodies, that is, institutions of democratic decentralisation); (b) co-operatives (which need to be revamped and democratised); (c) voluntary organisations (which may act as catalysts of social change); (d) scientific, technical/professional institutes; (e) a reoriented official machinery; and (f) an evaluation network.

The basic institutions of democratic decentralisation will extend from the village up to the district level. At the grassroots level, the Gram Sabha will ensure accountability of the panchayats and facilitate active participation by the community in the development process. Hitherto, active participation by women, Scheduled Castes and Scheduled Tribes and other backward groups has generally been lacking. This has to be ensured through their representation on the panchayats. The availability of decentralised institutions at the grassroots level is therefore a necessary first step to decentralised planning and to mechanisms for improving the share in development of the hitherto depressed sections of society. A certain number of seats is to be reserved for women and the Scheduled Castes and Scheduled Tribes in the elected bodies, to enhance their capacity to press for equity in the formulation of local development programmes and the allocation of resources. In West Bengal, it is mandatory to paste all decisions of the panchayats on the notice board of the panchayat building, so as to awaken general consciousness and awareness of the populace. Periodic elections to all panchayat bodies have to be mandatory, so as to help the weaker groups of society to improve their relative position over time, with the aid of the electoral process. The content and priorities of development need to be changed, and the development programme needs to be made relevant to the needs of these sections of society. The reservation of seats or such sections will provide them with an opportunity to do so, and to participate more actively in the programmes calculated to enhance their productivity and income.

Area planning has to be the means of bringing about the requisite change, by the decentralised institutions—the panchayat bodies and municipalities—so that the

available resources are put to efficient use. The convergence of social services in each area will help in the efficiency of use of resources for improving the quality of life.

Co-operatives are yet another institution that embody economic democracy. The existing state of the co-operatives is sad; they are unrepresentative and bureaucratised; their benefits have been usurped by a few, and the lack of repayment of past loans (taken by a few) prevents them from making a dent on the problem of credit in the rural areas. The co-operatives need to be revamped, democratised through wider participation, and invigorated through legislative and other reforms. The credit needs of the poor producers cannot be met without a revamping of the co-operative structure.

Voluntary agencies can help to spearhead and sustain social reform movements. They can, on occasion, provide countervailing power against undue pressure exerted by the stronger elements and vested interests, and thereby serve the interests of democratic decentralisation. Voluntary bodies can act as articulators of problems and catalysts of change. What they can never be is to become substitutes for people's own organisations. There is thus a clear role for voluntary organisations to assist in the process of social transformation. But they cannot ever play the role that democratic decentralisation can.

Knowledge is capital. In order to enhance the capability of the rural population and to increase the competence of local bodies to plan and implement their local area development programmes, a whole network of scientific inputs will be necessary, to gather and to disseminate data/information; to provide technical and professional assistance in aid of local development effort. It would be necessary to involve numerous educational, technical, scientific institutions, as well as management, marketing and other professional bodies. There are a large number of institutions in the country as of today. Their expertise is not available for blending the latest scientific knowledge with the home-spun traditional knowledge and experience of local people. It is not only necessary to blend the two—as, for instance, by reaching the satellite imagery maps to local bodies in order to assist in the preparation of 'watershed' area plans—but also to expand local markets, establish market linkages, market information, product development and trade and credit channels.

The reorientation of the official machinery to meet the above types of developmental needs of the rural population will not be easy, but is necessary. Fortunately, the Indian bureaucracy is both enlightened and flexible. It needs firm political commitment to the above ideology and principles. It needs clear guidance as to what is expected of it. The decentralised institutions need technical and management support. Development administration has to focus on the convergence of services at the field level, instead of vertical, departmental, compartmentalised pro-

vision of fragmented services.

We also need to learn continually from our past experience, replicating successful efforts and avoiding past mistakes and failures. We need an evaluation network involving social science, technical and professional institutions. We need independent institutions throughout the country, to carry out periodic evaluation studies. Eternal vigilance is the price of democratic development.

VIABILITY IN EXTERNAL PAYMENTS

India is currently facing bankruptcy in the matter of external payments—the result of 'living it up' throughout the decade of the eighties. We have achieved a high rate of overall GDP growth at the cost of heavy dependence on savings imported from abroad, as well as of a fiscal imbalance which has led to heavy dependence on deficit financing which has been fuelling inflation despite three record harvests in the past three years. On the external front, our import demand has been increasing rapidly for four reasons: (a) the spread of the gospel of elitist consumerism even by the official media such as the TV network, which creates a large import demand, in turn fuelled by a pseudo-policy of liberalisation of the import of technology (which leads to import dependence); (b) the increase in non-commercial imports (including imports related to defence) which help to create jobs abroad but not in India, at the same time creating similar pressures in neighbouring countries, leading to futile expenditure by both our neighbours and us, when we need more regional co-operation; (c) the pattern of industrial growth in the past which has been import-intensive; and (d) the pattern of energy consumption which points to the need for a directional change in our planning approach. We need to achieve viability in external payments, for which we need to turn away from easy solutions. We need, in fact, several hard decisions and changes in policy. First, we need to reformulate our energy policy, and reduce our dependence on imports for primary sources of energy. For this, we need a systematic and sustained drive for energy conservation on the one hand and development of renewable sources of energy on the other. Long-term road transport is the biggest and most wasteful user of a precious imported fuel; and we need to focus on the development of an efficient railway system to contain the burgeoning demand for diesel oil for road transport. We must also ensure the availability of a minimum of energy to all citizens; and here again, we need to intensify our search for and exploitation of non-conventional, renewable energy sources, so as to prevent the denudation of our already meagre tree cover, and the degradation of the environment.

This also involves a significant repatterning of our industrial development programme, not only to make it less energy-intensive but also to make it more employment-oriented (and less capital-intensive). In any case, the thrust for exports has visibly come in recent

times from small-scale industry; and we must provide all the required organisational and institutional support (by way of credit, raw material supplies, marketing and design assistance, etc) to small producers. Decentralisation of the production of consumer goods in particular is likely to provide the basis for increased employment, as well as reduce the energy-intensive pattern of industrial growth followed in the recent past.

The second major change in industrial policy has to do with development of our own research and development effort, and of our design engineering capability in place of reliance on imported technology. The latter should—except where necessary to upgrade our infrastructure services and efficiency of key intermediates production—be linked to exports, or at a minimum, a favourable net foreign exchange position, through insistence on exports to pay for all imports and import payments.

The third focus in industrial policy has to be on the efficiency of capital goods and key intermediates production, which would help to bring down the cost structure generally and make our manufactures internationally competitive. One requirement in this context is greater competition within the country, which can be spurred by increasing deregulation and dismantling of licensing and other controls, and reliance on fiscal and other financial levers of policy. Another requirement in this context is the reform of public sector enterprises, the first requisite of which is the distancing of enterprise decisions from government, making the management more 'accountable' by making the management of public enterprises rely more on the capital market (including the financial institutions) for financial support, in lieu of dependence on budgetary support for survival.

PLANNING FOR SOCIAL TRANSFORMATION

To the extent that other than infrastructure, by and large public enterprises should be made self-financing, there should be available larger plan funds for the financing of social services like education, health, maternity and child care, et al. Social transformation of any kind has to start with education; and universal education has to be the key element of social policy. Within education, focus has to be necessarily on primary education, non-formal education for the adult illiterates (as well as for certain other categories), vocational education at the secondary level, with higher education being made to pay for itself (except insofar as there would be need for ample scholarships for the bright, needy students who satisfy the means test).

There are many other elements to the story. But there is little merit in recounting all of them except to stress that financial devolution is of the crux in this attempt to reorient our plan strategy. If decentralisation of the body politic is to make sense, it has to be accompanied by effective decentralisation of finance, and devolution of resources from the Centre to the States and from the States to the local (panchayat and

other) bodies.

Efficiency in the use of all resources must be a cardinal principle to be followed. One way to achieve this is decentralisation. Another is the gradual elimination/reduction of covert subsidies. As long as the distribution of income and assets remains unequal, some subsidies must remain. However, so long as such subsidies are (a) overt, and (b) properly targeted, there is nothing unusual or untoward in the system. All economic systems need taxation for the system to function; and all extant literature points to need for the taxation system to be progressive. Subsidies are nothing but a form of negative taxation, a way of compensating the poor and deserving for the inadequacy of their incomes. Equally, there are today, any number of covert subsidies which have no justification, and need to be eliminated, some gradually, some immediately. Overt subsidies also need to be suitably targeted. For example, as stated earlier, higher education ought to be made self-financing, and yet deserving poor students ought to be given scholarships for such education. That would be in the best interests of society.

SUSTAINABLE DEVELOPMENT

How does the reorientation of our development on the above lines become sustainable? In the first place, we must recognise that economic development is possible only in a framework of social and political stability. The latter depends on: (a) a measure of equity in the distribution of income, and (b) a recognition of the need for an equitable pattern of socio-economic development, or at least a move towards such a pattern.

Social tensions could arise from a variety of reasons, but economic backwardness, discrimination and repression are a major set of factors contributing to social tensions. Sustainable development requires equity in distributing the gains of development.

There is yet another essential ingredient of sustainable development; our ecology, our

environment, our natural resources must be able to sustain the pattern of development pursued. The biggest casualty in the past few decades has been our environment. We must conserve our environment, we must ensure that our natural resources are able to sustain our development. Though scientific discoveries and inventions are constantly opening up new vistas of resources—one example being the possibility of using solar energy for our development programme—there are other areas where environmental considerations (or the lack thereof) can affect the pattern of our development programme significantly. The use of water is but one example. The replenishment of soil nutrients, the maintenance of an adequate tree cover, are two others. In the past, our development programme has been singularly insensitive to these concerns. Development programmes have relentlessly benefited a few, at the cost of the environment, at the cost of future generations. There is need for a directional change in our very approach to environmental considerations in our development programme.

Equity and social justice, and sustainability of the programme for future generations, are therefore major desiderata in planning for future development.

These are matters of concern for the future. Even for the present, equity and justice require a major shift of focus from the pattern of development pursued in the eighties.

As the country prepares itself for another general election within eighteen months, as a new government (and presumably a new Planning Commission) is about to take over the task of formulating the Eighth Plan, the considerations outlined in this series of articles, the *social transformation* that was to inform the Eighth Plan approach approved by the NDC in September 1990, need to be kept in mind by all those who are concerned with the task of plan formulation and implementation in the coming days.

Tripura and Election Commission

A Correspondent

Nine IAS officers in Tripura have submitted a letter to the Election Commission expressing their apprehension that 'concerted efforts' may be made by the State government to subvert the electoral process. Yet curiously enough the Election Commission has chosen to disregard the mass election-eve transfer of officials in the State

THE Election Commission has been commended for asking the State governments of Bihar, Rajasthan, Himachal Pradesh, Uttar Pradesh and Haryana to stay the transfer of officials on the eve of the elections. Though, strictly speaking, these governments did not go against the letter of the law as they ordered the large scale transfers just before the Election Commission's deadline for making such changes, they clearly violated the spirit of the law. As these transfers were politically motivated and were clearly undertaken to further the prospects of the ruling parties in these states in the forthcoming elections, according to some sources, this crack down on the erring State governments has gone a long way in re-establishing the credibility of the Election Commission and has also demonstrated without any doubt that the commission cannot be trifled with.

However, the praise showered on the Election Commission for taking a bold stand on the transfer issue in some States deserves to be tempered by the fact that it has adopted double standards and has turned a blind eye to the same kind of violation of the spirit of the law in some other States like Tripura. While it has gone on record objecting to the transfers in Bihar, UP and some other States, it has found no reason to interfere with the mass transfer of officials in Tripura, Madhya Pradesh and Andhra Pradesh as, according to the Election Commission, in the commission's view, the complaints from these States were not of a serious nature.

It may be recalled that on March 23, beating the Election Commission's March 25 deadline banning all transfers by the skin of its teeth, the government of Tripura issued an order transferring all five IAS, SDOs of Tripura who would normally work as assistant returning officers during the forthcoming elections and replacing them with junior ranking Tripura Civil Service officers. It is alleged that the IAS officers were transferred under the chief minister's orders and the five State Civil Service officers who have replaced them are favourites of the

government. They have been promoted out of turn, flouting the seniority list of the State Civil Service according to some sources.

The incident has naturally raised a furore in the State. The CPI(M) complained to the Election Commission alleging that these transfers were politically motivated and were a prelude to the mass rigging and booth capturing by the ruling Congress(I) TUJS coalition expected during the forthcoming Lok Sabha elections in Tripura.

Seshan in his superior wisdom has chosen not only to ignore the complaints of the CPI(M) led opposition but also the letter signed by nine IAS officers of the Tripura cadre addressed to the chief electoral officer of Tripura a copy of which was sent to the chief election commissioner for his information. In this letter, these IAS officers brought to his attention "the deplorable situation prevailing in the administration of Tripura" which, according to them, "renders the holding of free and fair elections absolutely impossible". Further, according to them "the sudden recent transfer of all the five IAS, SDOs (who would normally work as AROs during the elections) in an order issued on March 23, clearly indicates the malafide intentions of the government particularly in the light of the Election Commission's orders banning all transfers from March 25". They categorically stated in their letter that "Officers and staff serving in Tripura have been so demoralised in the last couple of years by repeated and unchecked incidents of intimidation, humiliation and assault that they seriously doubt as to whether anyone will be able to perform their (sic) duty during these elections in accordance with the letter and spirit of the Representation of the Peoples Act". In their letter they also communicated their apprehension "that serious and concerted efforts may be made on this occasion to subvert the electoral process by using all the means available to the government". They therefore urged the chief electoral officer "to take up this matter with the Election

Commission and to initiate immediate remedial steps to retrieve the situation so that the right of the people to vote freely and without intimidation is ensured".

The decision of the chief election commissioner to clear the transfer of key officials in Tripura connected with election duties as routine and in consonance with administrative norms is difficult to pass off as impartial. Its inexplicable silence over the serious charge levelled against the Congress(I) TUJS State government of Tripura has led some to suggest (probably with very good reasons too) that the Election Commission has acted in a very partisan manner.

Even if the CPI(M)'s allegations are dismissed by the Election Commission as politically motivated, the serious charges brought against the government of Tripura by the nine IAS officers of the Tripura cadre can hardly be treated as a hysterical outburst deserving to be ignored. They had marshalled very relevant facts to confirm their suspicion that the transfer order of the IAS officers indicated 'malafide intentions of the government' namely, that these "transfer orders had been issued only a few days after the hasty and humiliating removal of Shyam Lal Ghosh, the acting chief secretary, and the severe curtailment in the powers and authority of the acting director general of police B J K Tampi".

Ghosh, the finance secretary to the government of Tripura and also the acting chief secretary had incurred the displeasure of the ministers of the government of Tripura by trying to enforce financial discipline in the State and by curbing financial irregularities of the government and infructuous expenditures by the ministers. He was summoned before the cabinet insulted by the ministers, relieved of his charge as acting chief secretary and forced to go on long leave as he was reputed to be a forthright and honest IAS officer. Incidentally, as acting chief secretary he was also the chief electoral officer of the State. Again, within a fortnight of the arbitrary and uncourtious removal of the acting chief secretary from his post on March 12, on the eve of the elections, the acting State director general of police was also removed from his office and asked to go on leave. His powers were transferred to the additional DGO whose post was created overnight without bothering to seek the permission of the Centre. Tampi's crime was to issue a circular on maintaining strict neutrality while on election duty to all police officers and men. Incidentally issuing such circulars before elections is the duty of police chiefs.

Besides the past track record of the

to the holding of elections in the State could hardly have impressed the election commissioner. Since the Congress(I)-TUIJS alliance forcibly captured power in the State in 1988, there have been four elections in Tripura. Each one of them has been marred by electoral violence and large-scale rigging and booth capturing in which ministers and MLAs of the ruling parties have participated actively along with their armed anti-social henchmen. The opposition has either had to withdraw its candidates or has had to boycott the counting of votes. In the Fatikroy by-election and in the last general elections, armed miscreants under the leadership of Congress(I) ministers drove out polling agents of the opposition parties and genuine voters from polling booths and stamped the ballot papers according to their own choice.

A polling agent of the CPI(M) was murdered inside a polling booth. In his message to the chief election commissioner after touring Tripura on the day of the polls to monitor the parliamentary election held in the State in November 1989, the ex-chief justice of Calcutta High Court, D S Teotin, who was sponsored by the Citizens Observer Monitoring Body, wrote "what took place, particularly in Tripura West parliamentary constituency cannot be called election. It was virtually one-sided affair. Opposition party voters were not allowed to cast their votes, their

polling booths. They were not even allowed to set up booths. I saw vehicles with covered number plates and packed with youths being escorted by police jeeps. These were earlier seen with local minister Samir Ranjan Barman's car at one polling booth. The election was totally rigged by the ruling party, i.e. Congress(I)." Clearly, on the basis of past experience alone, one can question whether polling in the state during the forthcoming elections will be free and fair. In the light of this background the transfer of officials on the eve of the deadline can hardly be treated as innocuous.

So, Tripura can be taken as the ultimate test case to prove the Election Commission's neutrality. It is extremely doubtful whether the present government of the State with its dubious track record of murder, arson, rape and looting and stifling all opposition by its musclemen before and after elections and electoral malpractices including rigging and booth capturing during elections will have the political will to conduct free and fair polls in the State. The high-sounding pronouncements of the chief election commissioner will cut no ice with the voters of Tripura unless he chooses to exercise his powers to ensure that the voters in this beleaguered State can really exercise their political choice without fear of threat or intimidation.

the villain (Karunanidhi and the DMK) and the equally deserved victory of the hero-heroine (MGR-Jayalalitha).

Since life is never larger than cinema and politics in Tamil Nadu, this grand opera of honour, revenge and redemption, comfortably translates itself into comprehensible terms of political discourse: thus, the media, purveyor of politics-and-cinema, dutifully and without the least trace of irony records with zeal the political wisdom and sagacity of 'MGR's sworn heir'. It would not matter so much if all this were to result in a public debate about violence against women but what we, in reality, are confronted with is the spectacle of Jayalalitha espousing the cause of women in MGR's name with the Congress(I) in tow, while the media in the State faithfully reproduce the strategic silences and elisions in this grand opera.

Consider, for instance:

- the silences regarding the wilful misuse and abuse of women in MGR films: specifically the covert interplay between a vulgarised female sexuality and a sickeningly fetishised motherhood that won the 'Puratchi Thalaivar' the votes of his female admirers;
- the elisions in Jayalalitha's well rehearsed passionate appeals against liquor dens; whereby MGR's shifting and opportunistic positions on prohibition are unproblematically reproduced in his heir's electoral promises. Jayalalitha, thus, promises total prohibition on the one hand but meanwhile goes ahead and nominates well known hooch dealers to contest on her party's ticket. Moreover she has refrained from issuing strictures against illegal liquor production or drink-related violence against women, something which, the 'Pattali Makkal Katchi' (PMK) has promised in its manifesto;
- the complete glossing over of the fact that sexual harassment and violence against women constitutes the basis for Tamil cinema and Tamil print media which have, in turn, contributed their own to the debasement of the public sphere of politics and to a misogynistic political culture. Jayalalitha's appeal, deriving as it does from her cinematic association with MGR would, in all likelihood, sustain and prolong rather than challenge the unashamedly anti-woman ideologies of a decrepit and moribund polity and culture.

These are pertinent and embarrassing silences but Jayalalitha's political rhetoric has sought to elide them even while making woman-related violence a main electoral concern. Her perverse political logic as regards women and violence has mostly gone unchallenged in the State. Neither the media, nor the public nor the various other political parties in the State have

TAMIL NADU

The Grand Opera Unfolds

V Geetha

The refurbished image which Jayalalitha is projecting today as the champion of 'women's cause' holds haunting lessons for women: that their multiple causes just might become the basis for a new patriarchal consensus.

JAYALALITHA JAYARAM has succeeded in enthusing not only the masses 'out there' but also the staid Tamil middle class 'in here' in the course of her election campaigns in the State. The news media, especially, has been visibly impressed by her 'performance' in far-flung villages and small dusty towns as she sets out to lay bare the DMK's 'misdeeds' under a scorching and relentless summer sky. Newspapers, both Tamil and English, have been replete with news of her promises, accusations, charm, political skill... and her fierce espousal of the 'woman's cause' has, further, legitimised her in the eyes of the liberal bourgeois press and its adherents.

There is, of course, much drama in all of this: especially since Jayalalitha never tires of bringing to public attention and

memory the violence inflicted on her on the assembly floors. She has displayed rare rhetorical skills in yoking together her personal humiliation and what she refers to as the general deterioration of law, order and norms of public morality in Tamil Nadu. Besides, her periodic, nostalgic (and politically astute) invocations of 'Puratchi Thalaivar' MGR confirm her in her self-image as the much wronged and abused woman, whose protector and redeemer (who is, by implication the protector of all Tamil women, their chastity and thereby the guardian of Tamil 'honour'), alas, is no more. On the other hand, her inflexible will to succeed, to usher in a 'golden age' under the auspices of MGR's memory legitimise her aspirations to power; thus the Tamil masses

asked to debate the issue. Jayalalitha's appeal, then, lies precisely here: in that she has managed to communicate directly with the woman voter in the State on a matter that is of existential and everyday concern to us. The current election campaigns have demonstrated that political parties have added one more gesture to their existing repertoire of ritual genuflections towards the landless, the homeless, the dalits, the tribals, the minorities; now politicians of all hues refer to 'women's equality and emancipation'. But it is Jayalalitha who has managed to bring to her campaign an 'authenticity'. After all, injured innocence and abused womanhood are eloquent in themselves and especially so to an avid film-watching public that, then, consents to systematic violence against women choosing to take note of woman-related violence only if issues of 'womanly honour and chastity' are involved.

This bizarre scenario of Jayalalitha espousing the women's cause under the benign (non) gaze of MGR's spectre, while the Congress(I) smirks behind rubbing its hands together in anticipation of victory, is all the more painful since the DMK-led alliance has refused to confront the issues raised by Jayalalitha except to confound them with their own specious arguments. Given the fact that the DMK's political rhetoric has consistently devalued women

and given the actions of DMK leaders who have in their private and public lives managed to live up to the transgressive demands of that rhetoric, it is difficult for the party to advance a credible defence in this instance. The silence of the Left constituents of the DMK alliance is altogether shameful. Thus, Jayalalitha as the stout-hearted defender of women's rights might, after all, carry the day with her.

Never mind her departures from the norms of classical Dravidian politics in her espousal of a pan-Indian Big Brother nationalism (after all, even Karunanidhi and the DMK have compromised most shabbily on the Eelam issue); never mind her vague and sentimental rhetoric (has not Karunanidhi, in a recent article, referred to the DMK as the chaste and virtuous Kannagi whose claims to justice and honour must be vindicated?); never mind her out-Mandalising Mandal (have 40 years and more of Dravidian rule enhanced the status of the most backward castes and the dalits? Witness, the rise to power of the DMK and the nature of its appeal), Jayalalitha's ideological inconsistencies will not matter in the final analysis.

But, for us, the women of this state, Jayalalitha's rise to power holds haunting lessons: that our multiple causes just might form the basis for a new patriarchal consensus, forged, as the irony of history would have it, by a woman.

JNM hospital, and to what extent doctors or hospital personnel were involved. (2) whose/what interests were involved in the misreporting (if any), and (3) role of the administration and police in this context.

Based on their extensive interviews, the team has put forward a reconstruction of the sequence of events which occurred at JNM college on December 7-9, 1990, extracts from which are as follows: "As a consequence of the Ram Janmabhoomi-Babri Masjid dispute and the Ram Mandir construction programme at the disputed site in Ayodhya after breaking/shifting of Babri Mosque by the Hindu communal forces like VHP, RSS, BJP, and Bajrang Dal, etc, the entire country has witnessed communal upsurge and violence in recent months. Communal passions, similarly, have been inflamed in Aligarh where rioting occurred in November-December 1990. Till date the city remains plagued by communal tension. On December 7, riots flared up in the city following alleged attack on two PAC jawans. However, conflicting reports could be gathered from the general public; some alleged attack on the masjid during Friday prayers as the genesis. Victims started arriving at the casualty of JNMC. The team found that after the first entry around 3.15 pm a total of 22 patients (including three Hindus) reported on the seventh, 37 patients on the eighth and 12 on the ninth (including the driver of the casualty ambulance). The crowd of relatives outside the casualty kept mounting, increasing over 1,000 on the second day, especially due to the tension in the city."

The report goes on to record, "On the eighth around noon, the Gomti Express was stopped in Aligarh despite curfew in the town, and Muslims were butchered. It was an organised plan with word of the attack all round in Hindu colonies. Around this time, the crowd outside the JNMC casualty was joined by 'anti-socials', from nearby colonies. Communal slogans were raised and stabbing occurred." The report analyses the causes of these as an exaggerated version of the Gomti Express killings, communal passions flaring up due to mutilated condition of patients being brought to the casualty, and the provocation by 'masked' anti-socials. It notes "on the eighth, two stabbings occurred, one of a Muslim youth (due to mistaken identity), who died and another of a Hindu who was successfully treated in JNMC hospital. The mob outside the casualty, meanwhile, vented its anger on the nearby Zakaria market where four shops out of a total of 25 (three were drug shops) and one 'khokha' belonging to a Muslim were looted and burnt. The team has related this attack to the probable pressing need for drugs for patients in the hospital, and

Aligarh Hospital 'Massacre': Fact and Fiction

Rajesh Sofat

An independent three-member team investigates the allegation that patients were systematically killed on communal lines by staff doctors of the Jawaharlal Nehru Medical College Hospital in Aligarh during the December 1990 communal riots in the city.

IN mid-December 1990, a devastating bout of communal violence broke out in Aligarh following certain reports in the city's local newspaper. These reports alleged that patients and their relatives had been deliberately killed on communal lines by doctors on duty at the Jawaharlal Nehru Medical (JNM) College, Aligarh. Even as this chilling charge shocked the medical community, news items appeared in the national dailies alleging false reporting of events by the local press in a deliberate attempt to vitiate the communal atmosphere, and malign the AMU and the doctors of JNMC. Meanwhile doctors of AMU appealed to the medical community to verify the facts, and this appeal was published in *Indian Express* (December 25, 1990). In response, the Delhi Medicos Front (DMF), a Delhi-based organisation of progressive doctors and scientists, con-

stituted a team after approaching the Resident Doctors Association (RDA) of AIIMS (New Delhi) and the National Co-ordination Committee of Young Scientists and Research Fellows. Consequently, a three-member fact finding team visited Aligarh on January 9 and 10, 1991, and extensively interviewed doctors (especially non-Muslim doctors on duty during the period of the reported incidents), nurses and other hospital staff, members of Junior Doctors Association (JDA), Aligarh, the medical superintendents of the JNM hospital as well as the district hospital, faculty members of JNM, and the district magistrate (DM), (Aligarh). Based on this extensive cross-section, the team released a report in Delhi. The terms of reference of the enquiry were (1) whether or not any massacre of patients and/or relatives occurred in the

stated that the mob never tried to enter the casualty or the hospital. The involvement of doctors or hospital 'karamcharis' can be ruled out authentically. The involvement of AMU students in the entire incident can also be ruled out with reasonable certainty.'

The team found that national dailies were not distributed in Aligarh during these three days and the entire source of information was the local Hindi press, which on the tenth had reported 74 persons massacred in the hospital, including 24 patients by Muslim doctors (*Aaj*, December 19, 1990). *Amar Ujala* had boxed an item on December 11, reporting that over 200 were killed by the JNMC doctors. However, as per casualty records, a total of 73 patients reported at JNMC up to tenth as riot victims, of which merely eight were Hindus.

An intriguing aspect of the report is an interview recorded with a group of Hindu doctors by the team. The report states that a Hindu member of the team was woken up by two people who were well aware of the composition of the team. They specifically excluded the Muslim member and took the other two to a 'meeting' outside the campus, after pledging them to total secrecy about the venue and the participants. Eight Hindu doctors of JNMC were present at the venue and they venomously repeated the allegations of the local press, adding that the doctors killed patients by "cutting open major arteries" and removing drips and respirators. However, on cross-questioning they admitted that none of them were on the campus on the three concerned days, and accepted that 50 per cent of the doctors of JNMC were non-Muslims. They were "unable to substantiate their charges with even second-hand evidence. All the eye-witnesses they specifically named, denied all allegations of massacre to the team. As a Hindu doctor pointed out 'doctors are aware of much more sophisticated methods of killing.'" Terming the group as 'pro-Hindutva' fundamentalists' the team comments "through one and a half hours of a meeting called by them for the express purpose none of the eight could name a single medical personnel or patient, or substantiate a single allegation".

ROLE OF ADMINISTRATION

On the basis of the evidence accumulated by it the team has branded the PAC as a communal force and advocated its dismantling. About the DM the report feels that the new incumbent has a pro-'Hindutva' bias, and substantiates this by a series of facts: first, even a month after the incident, the administration had made no move to establish what really happened. The DM had issued an official denial of the alleged massacre after visiting the

hospital but nothing was being done to counter rumours and false propaganda. Rather "the DM still has doubts as echoed to the team". Secondly, the Gomti tragedy happened in broad daylight with thousands of communal fanatics braving indefinite curfew and with the whole city knowing of the organised plan, but the administration neither prevented the attack nor did it admit to prior knowledge. Thirdly, the DM was concerned about Hindus at AMU but not about "Muslims who constantly simmer in the fear of majority communalism and administrative bias and [the DM] has issued several controversial orders like the closure of hostels, the order to channel riot victims (mainly Muslims) through the police, which discriminates the community they belong to, thereby denying them the benefit of immediate care, in gross violation of the Supreme Court verdict and medical ethics".

In fact "he initially denied any such order but later accepted it, saying that 'these patients are riot victims and not merely patients. . .'. He said that there is no police chamber near JNMC and expressed his dismay that 'even after personal request, hospital authorities are accepting riot victims'. He later justified his order by observing that Muslims go only to JNMC and not to Malkhan Singh Hospital."

Apart from active administrative connivance with the Hindu communal force the team concludes that it would not have been possible to cause widespread and continuous havoc without the involvement of political forces of the ruling class and shows the nexus of BJP and Congress(I) politicians in particular. It also notes that 'satta' (gambling) played a significant role in keeping up the tempo of communal tension and violence. The other group found overtly benefiting from the propaganda against the hospital are private practitioners, who seemed to have been "actively involved in fuelling propaganda against JN Medical College". The report also mentions that the team was unable to locate any Muslim fundamentalist groups but adds that even Hindu communalists do not levy specific charges against them.

While the active involvement of the local Hindi press with its general communal propaganda and particular vicious role in this incident is documented in detail, the team was "deeply perturbed by the role played by Doordarshan which aired the newspaper reports without verification". It is correctly pointed out that this "raises genuine doubts about the secular integrity of administration and the autonomy of Doordarshan". Thus the "brute administration succeeded in yet another outrageous plan against humanity". Some proof of the fabrications broad-

cast by Doordarshan are reports of closure of AMU and the hostels, of two policemen being stabbed by students on AMU campus, of the murder of a local VHP leader, and worst, of dead bodies being found on the campus!

The DMF report states, "At a time when communal passions are high, the value of news in a riot-stricken, curfew-bound city full of numerous rumours could only be realised by the lessons of the Aligarh tragedy". National newspapers, which could have been alternative sources of information, were burnt on the outskirts. Asserting that "the local press version of JNMC incidents are totally baseless and fabricated—what happened was not reported and what was reported never happened" the team records that the false reporting served multiple purposes as the proverbial fuel to the fire of communal passions that too on a highly emotional issue. It notes "the propaganda goes on unchallenged and unabated".

Recording that the AMU is a seat of Muslim intellectuals, known for its progressive and secular traditions and hence has been a continuous target of Hindu communal propaganda, the report states, "During the stay of two days, the team was allowed free access to all parts of the hospital and wards. There was no evidence of deliberate suppression of facts and the attitude of all authorities in JNMC and the university was very cordial and co-operative. It would be worth mentioning that a number of non-Muslim junior doctors and most of nursing and other paramedical staff were doing their duties without fear." It submits, "nothing [untoward] happened in the hospital premises of JNMC between December 7-10, 1990. No patient and/or relative was killed by any hospital personnel. The team found no reason to doubt the secular character of AMU and "defends the JNMC whole-heartedly" while contending that "there is an organised attempt to malign AMU by a nexus of Hindi press of UP, Hindu communal forces and the district administration. The Doordarshan newsdesk played a partisan role and aided Hindu communal forces to succeed in their evil designs." On the overall situation in the country, which provided the setting for the report, the team concludes, "the worsening performance of the state on all fronts, a deepening economic crisis, and its antecedent effects are forcing ruling class parties to take a stance aimed at diverting the attention of the nation to peripheral issues" and asks the people to see through the evil designs of all ruling class parties and advance democratic struggles.

[The three-member fact finding team comprised D K Saxena (NCCYS and RF), Najib Siddiqi (DMF) and the author (RDA, AIIMS).]

The Press and Jan Vikas Sangharsh Yatra

Ashish Kothari

A clear link between the government of Gujarat and the Gujarati media was revealed not merely by the fact that the latter periodically parroted everything that Chimanbhai Patel or other politicians said, but also by the similarities between official press handouts and the news reports in various papers.

THE conduct of the press during the recent five-week long Jan Vikas Sangharsh Yatra (December 25, 1990 to January 31, 1991) in the Narmada Valley invites comment. The national press (English and Hindi) was, with some notable exceptions, balanced in its reporting, but the local, especially Gujarati, media buried objectivity and bent over backwards in trying to denigrate the Yatra and its organiser, the Narmada Bachao Andolan, revealing a clear nexus between itself and the State government.

The Yatra was an attempt by tribals and peasants threatened with loss of home, land, and cultural destruction by the Sardar Sarovar Project in Gujarat to assert their right to life and livelihood. Its specific demand was a comprehensive review of the project, and a stay on all irreversible work while such a review was on. This the Yatra participants aimed to do by trying to halt themselves the construction work on this project, by offering peaceful *satyagraha* at the dam site.

It was at the level of the Yatra's aims itself that the distortions in the Gujarati press started. 'Baba Amte's band out to break the dam' was the constant refrain; the Yatra was seen as a violent move to smash the dam wall, and allegations appeared that the marchers were carrying bombs, that Medha Patkar, Girish Patel, and numerous tribals were preparing for armed combat (*Gujarat Samachar*, 31/12/90), that Gujarat's peaceful citizenry would be attacked with bows-and-arrows, spears, sticks, scythes, and other weapons (*Sandesh*, 29/12/90), that secret youth groups had been formed to 'infiltrate' Gujarat from various points and smash the dam (*Loksatta-Jansatta*, 29/12/90), that Swami Agnivesh (an active supporter of the Andolan) had overnight disappeared from the Yatra camp and would reappear at the dam site to sabotage it (*Pravasi*, 31/12/90). The cake was taken by an imaginative *Gujarat Samachar* staff photographer who got some tribals at Alirajpur (who had nothing to do with the Yatra) to pose aggressively with their weapons, and claimed that Yatra participants were being trained to use them against pro-dam people and officials! A report in the same newspaper claimed that the following

slogan was common in Baba Amte's camp: "Every bullet from Gujarat-police will be answered by two arrows from us"! Through these and other distortions and lies, the Gujarati press continued to create the impression of a violent, 'anything-goes' mob hell-bent on breaking the dam. And this despite the many clear indications of the genuinely non-violent and peaceful nature of the Yatra, including the total absence of weapons (the tribals were told specifically to leave their bow-and-arrows, scythes, etc. behind), the tying of hands of Yatris when entering Gujarat, the refusal to clash with people blocking the way, and the constant refrain *Hamla chahe jaisa hoga, haath hamara nahi uthega* ('Whatever the nature of attack, we will not raise our hands').

Perhaps even more dangerously, the Gujarati press spared no effort in trying to portray the Yatra as 'anti-Gujarat' (for once, the usual allegation of environmentalists and social activists being 'anti-national' was pushed to second place!). This was done first by equating anti-SSP protestors as anti-Gujarat elements, using the highly questionable assumption that SSP is the 'lifeline' of Gujarat, ignoring the very many substantial arguments put forth by the Andolan against this assumption. But the press did not stop at this. Subtle and not-so-subtle hints appeared of the 'clear intentions' of the Yatris to create a 'regionalist' war between Madhya Pradesh and Gujarat, as evidenced, apparently, by constant 'anti-Gujarat' slogans in Baba Amte's camp (*Gujarat Samachar*, 31/12/90). For the Gujarati media, as also for the government of Gujarat, the MP-Gujarat border almost took on the appearance of an international boundary, and the Yatris all but became foreign aggressors.

As if this was not enough, the Gujarati press started creating imaginary divides between Baba Amte and the rest of the Andolan leaders. No one will deny that there were differences of opinion between various members of the Andolan's decision-making group, consisting of village representatives and activists (including Amte). These differences pertained mainly to strategy, which was discussed every day of the Yatra. It is, in fact, a sign of the strength of the move-

ment if such differences are openly voiced and resolved. The omnipresent press is bound to hear these diverse opinions, but ought to be responsible enough to take them in the right spirit. Not so the Gujarati press. To it (and even, surprisingly, to *The Times of India*, signs of a 'split' appeared as soon as the Yatra started, and 'disenchantment' of the tribals with Amte grew as the march proceeded. And what were these signs? One, the press said, was the change in slogan, from *Baba tum sangharsh karo, hum tumhare saath hain* ('Baba carry on your struggle, we are with you'), to *Sangharsh hamara jari hai, Baba hamare saath hain* ('Our struggle is on, Baba is with us'). With a bit more investigative zeal, or perhaps simply greater honesty, the Gujarati press ought to have reported that this change was affected on Baba's own promptings, and in consultation with other Andolan leaders, to highlight the genuine mass base of the movement.

The need for the Narmada Bachao Andolan to make such symbolic changes was prompted only in part by the internal dynamics of the movement, specifically as a balance to the natural tendency of many of the Narmada Valley people to look up to Amte as a leader. But more than this, it was done to counter the excessive 'Amte-isation' of the movement by the state and the press. In this the national press was as guilty as its regional counterparts. Headlines regularly used the phrase 'Amte's followers' or 'Amte's band'. Perhaps the crucial difference between the national and regional press in this was that the former appeared to latch on to Amte simply due to his charisma, while the latter deliberately tried to make out a case of Amte vs the Andolan. Interestingly, in this the Gujarati papers mirrored the attempt of the government of Gujarat to single out Baba, deliberately ignoring the rest of the Andolan's leadership. That however, is material for another article.

COMPOSITION OF YATRA

The composition and magnitude of the Yatra were also subject to wild distortion by the press. The Gujarati papers consistently understated the number of Yatra participants (at times claiming participation to be less than 500), while a few English papers, at times overstated it (such as *The Independent*, with a figure of 7,000). Both are unacceptable if they are deliberate distortions, as they must be when an honest figure of 3,500 (the approximate number of participants when the Yatra reached the Gujarat-Madhya Pradesh border) becomes 500 on one side and 7,000 on the other.

Remarks about the composition of the Yatris were even more objectionable. *Loksatta* reported that the number of fun-seeking city youth in Baba's camp was greater than the number of Adivasis. An

youth, who claimed to have infiltrated the Yatra camp and 'discovered' that most of the Yatris were hired by Baba Amte for Rs 25 per day, and that liquor was 'flowing freely' in the camp, was eagerly lapped up and given prominent headlines (*Gujarat Samachar*, 2/1/91). Worse, *Gujarat Samachar* (7/1/91) claimed that many of the Yatris were drug pushers and wood smugglers, whose business would be affected since the dam would submerge extensive poppy fields and forests. It even went on to suggest that Baba himself was benefiting from these illegal activities; why else, it asked rhetorically, would he leave his leprosy patients and settle on the Narmada banks? According to another Gujarati paper, *Pravasi*, (2/1/91), criminal elements of Madhya Pradesh were forcing people to join the Yatra.

Direct, and not-so-direct, character assassination was also the order of the day for the Gujarati media. Baba was alternately described as senile, as a mere puppet in the hands of extremist youth, as a 'foolish environmentalist' out to cause 'regional war between Gujarat and Madhya Pradesh' (*Gujarat Samachar*, 31/12/90), and amusingly, as 'worn-out hardware' for Medha Patkar's 'software' (*Gujarat Samachar*, 7/1/91). These last two descriptions were penned by one Devendra Patel, and the newspaper can claim that it was merely allowing freedom of expression in printing his article. *Sandesh* can make the same claim for the writings of one Swami Sacchidanand, to which enormous quantities of newsprint and advertisement space were devoted, but which consisted of little more than calling Andolan participants various denigrating names ('mosquitoes' was one of the more amusing ones), or spreading canards (providing the Yatris a big laugh when, once, he married me off to a fictitious German girl, through whom the Andolan was allegedly receiving foreign funds). But a paper which allows such blatantly scurrilous and deliberately provocative writing, and simultaneously blanks out any responses/reactions from the victims of these articles, is clearly being very one-sided in its championing of the freedom of expression.

Another favourite theme of the Gujarati media, and in this it was at times joined by the Hindi and English regional and national press, was the alleged 'foreign links' of the Andolan. In the first few days of the Yatra, photographs of foreign participants in the Yatra (a handful of members of international groups who are fighting against the involvement of the World Bank and their own countries in financing the Sardar Sarovar Project) appeared prominently in almost all Gujarati newspapers to 'prove' the 'fact' that the movement was 'incited and funded' by 'outsiders' who did not want India to develop. *Gujarat Samachar*

spending lakhs and crores of rupees, and where did this money come from if not from foreign sources? A *Blitz* headline screamed 'Foreign plot exposed by Chief Minister', and thereafter proceeded to repeat all of Chimanbhai Patel's lies as if they were gospel truths. Repeated challenges by the Andolan, to the government or to any other person/agency making these allegations, to prove their charges were of course consistently ignored by the Gujarati press. Only the Hindi regional press, and a part of the national press, had the honesty to report these disclaimers and challenges by the Andolan.

Blatant acts of distortion and half-truth were mirrored by a studied silence, especially on part of the Gujarati press, where it came to news which was pro-Andolan or anti-dam. Such omission can be as important in moulding public opinion as actual reporting, and the newspapers used it to full hilt. The daily press releases issued from the Sangharsh Yatra camp were ignored. A number of events were completely blacked out or given an inconspicuous, almost hidden, space in the papers. The departure of a small group of tribals (11 in all) for

NATIONAL INSTITUTE OF RURAL DEVELOPMENT

(An Organisation of the Ministry of Agriculture &
Rural Development, Govt. of India)

Rajendranagar, Hyderabad-500 030. (India)
requires

ASSISTANT DIRECTORS

In Reserved category in the Pay Scale of
Rs. 2,200-75-2800-100-4000. Three posts are
reserved for ST and Two for SC candidates.

Qualifications

Essential:

A first or high second class Master's Degree in
any of the Social Sciences with Ph.D. or
equivalent work.

Desirable:

Atleast five years experience in handling
Research Projects, Training or Field
Studies/Surveys in Rural Areas in relevant
topics.

Age:

40 years (inclusive of relaxation of five years in
case of SC/ST Candidates)

General:

1. Persons appointed to the above post will
be on Probation for a period of two years.
2. Deputation from Govt. Departments/
Organisations, Universities and other
Institutions could also be considered on
merit.
3. Employed persons should submit their
applications through proper channel.
4. Prescribed application forms alongwith
other particulars may be obtained from the
Assistant Registrar (Establishment) NIRD,
Hyderabad by sending an Indian Postal
Order for Rs. 1.50.
5. Prescribed applications duly filled in and
supported by relevant documents should
reach the Registrar, NIRD on or
before 17.6.91.

REGISTRAR

ASP/NIRD/91/36

pressing reasons back in their villages was blown up by the Gujarati papers (*Sandesh*, 14/1/91) as indications of a collapse in the movement, but the daily arrival of dozens, sometimes hundreds, of new people from the Narmada Valley towards the latter half of the Yatra, to express solidarity with the seven fasting people, went completely unreported! A day-long 'Ghati bandh' (Valley closure) on February 12, 1991, in which entire villages and towns (Kukshi, Manawar, Anjad, and several others) participated in support of the Yatra, was similarly ignored. It was, however, picked up by the Madhya Pradesh Hindi media (*Nai Duniya* 13/1/91). Most damaging, the participation of over a score of Gujarati organisations, and several prominent Gujaratis, in the Yatra, was ignored; only the *Sandesh* once grudgingly admitted that many Gujaratis were supporting the Andolan (13/1/91). Rock-bottom was reached when not a single Gujarati newspaper reported a demonstration in Ahmedabad, in mid-January, in support of the Yatra, which was violently broken up by Janata Dal Youths. Also ignored was a statement, released to the press on 17/1/91 by over 100 eminent Gujarati academics, artists, and others, condemning the State government's misuse of resources to build a mass anti-Andolan hysteria. The statement urged the government to step down from its stubborn stand and talk with the Yatriis. These omissions were not surprising, for such reporting would have shattered the 'all-of-Gujarat-stands-united-in-support-of-the-dam' myth built up by Gujarati politicians and media over the last few years.

Also conveniently blacked out was the true nature of the pro-dam rally, the so-called Shanti Yatra, organised in Gujarat to stop the Sangharsh Yatra. The blatant use of state resources (vehicles, fuel, electricity, infrastructure, etc) for the Shanti Yatra, the lumpen behaviour of many of its participants (they actually laughed and clapped when Baba fell unconscious one day), their shameless use of below-the-belt tactics (such as blaring loudspeaker at full volume through the night, within hearing range of Baba's bus), the parading of Home Guards (some of them with their uniforms peeping out from under their 'civilian' clothes) as pro-dam Gujarati citizens, the discriminatory use of Section 144 to restrict the Sangharsh Yatra participants while allowing the Shanti Yatra members free access on certain occasions: all these and other events/features which showed up the Shanti Yatra for what it actually was, were given a royal pass by the Gujarati media. Quite the contrary, an impression was sought to be created of a 'sea of humanity' spontaneously rushing to Ferkuwa to stop the Sangharsh Yatra, braving the cold, displaying admirable patience and non-violence. Fortunately there were several independent media per-

sons, including camera wielders, who were present to record the truth (for instance, Lester Continho's report in *The Times of India*, 28/12/90). The editors of *Sandesh*, *Gujarat Samachar*, *Pravasi*, *Loksatta*, *Jansatta*, and other Gujarati newspapers, would do well to look at the video coverage of the Yatra; but then, so hardened must they be in their unconcern for such peripheral things as the truth, that perhaps they will not even blush.

A clear link between the government of Gujarat and the Gujarati media was revealed not merely by the fact that the latter periodically parroted everything that Chimanbhai Patel or other Gujarati politicians said, but also by the not-so-coincidental similarities between official Information Bureau press handouts and the news reports in various papers. Indeed, government press releases were the source of many a lie that appeared in the Gujarati media.

Daily releases from the Gujarat government's Information Bureau usually contained glowing accounts of the pro-dam Shanti Yatra, including full statements by Urmilabehn Patel (Chimanbhai Patel's wife, and one of the leaders of the pro-dam rally) and other leaders. But they often also described, in as denigrating terms as possible, the Sangharsh Yatra and its participants. An official press note on 31/12/90 reproduced Swami Sacchidanand's statement alleging that "Baba was out to break the dam even as the Gujarati public was dying of water and food scarcity". The same day another official press handout claimed that there were one or two thousand people in the Sangharsh Yatra, of whom only a handful were tribals, and the rest urbanites; this was repeated on 5/1/91, when, of the "less than 900 left, most were urbanites and fashionable youths". The note of January 5 was, indeed, full of defamatory gems: "Baba and other Andolan leaders hold no ideological position other than a stubborn opposition to SSP", "Baba is a puppet in the hands of others", "anti-dam people have little factual basis for their arguments, and are relying more on tribal weapons and fundamentalist environmentalism to oppose Gujarat's development". The previous day, an Information Bureau handout claimed that police was forced to round up 117 Yatriis, as they became violent and aggressive despite the collector and the DIG appealing for peace; this note completely ignored the fact that most of these people, who had entered Gujarat and were squatting on not being allowed to go in further, were arrested late in the evening, when they had started to eat! It also conveniently omitted any mention of the completely unprovoked lathicharge on peacefully squatting protestors, which preceded the arrests and which was reported by most national dailies and regional Hindi papers. One day before this, on 4/1/91, the clash between Yatriis

and police was described by an Information Bureau press release as "a violent attack on pro-dam people and home guards/police". A concocted story was presented, of a Yatra activist trying to snatch away the 'mangalsutra' of a woman home guard. Gujarati newspapers of course gleefully lapped up this untruth. The official press release ended by giving the amazing 'news', that it was on a complaint by this home guard that seven activists were arrested—as if it would require seven people to snatch a 'mangalsutra'!

A frequent theme of these official handouts was the allegedly growing 'disenchantment and despair' in the Sangharsh Yatra camp. A reported statement by Maneka Gandhi, union minister of state for environment and forests, that there was no question of reviewing the SSP, was thought to have caused dejection in Baba's camp while spreading cheer in the pro-dam rallyists (3/1/91). Baba was described as "standing on the doorstep of his ambulance, looking at the pro-dam rally with helplessness and despair" (5/1/91). And another official release claimed that "700 Yatriis had abandoned the camp after realising that the Andolan had misled them, that the government of Gujarat would ensure that they get everything possible".

Instances of consistently balanced reporting in the Gujarati media are hard to come by, but a few publications were more conscientious than the major dailies. *Gujarat Mitra* published a five-part article giving the Andolan's version of the story, the Gujarati edition of *The Times of India* was relatively more balanced in its coverage, and the magazine *Abhiyan* came out with a bold and truthful expose of the real issues involved. But these were flashes in the pan, exceptions to the rule.

In today's world, the media is a great opinion-builder, an influential moulder of public policy, a powerful watchdog. A press which systematically raises regionalist fervour and vilifies the atmosphere by distorting or hiding the truth is a sick press, one which has abdicated its responsibility of being the society's watchdog. When the watchdog itself turns monster, there is indeed occasion to mourn. A complaint regarding the Gujarati press's biased treatment of the Yatra, filed by the Narmada Bachao Andolan, is pending before the Press Council. The decision of the Council will tell whether the mourning can be converted into a regained sense of hope.

Uncertain Election Prospects in Nepal

Brahmanand Mishra

None of the political parties, not even the well-organised Left, appears to have taken seriously the significant gains for democracy after the overthrow of the party-less Panchayati Raj a year ago.

THE political renaissance in Asia which began in the early part of this century was basically concerned with the right to self rule which was the principle platform of the Indian National Congress under the leadership of Mahatma Gandhi. Though Gandhi had a very clear concept of the nature of democracy he envisaged, the movement initiated by him got largely oriented towards one goal: getting rid of foreign colonial governments which were then ruling most parts of Asia. As a consequence the inherent political culture as adopted by many western countries and developed through practice over a period of centuries failed to take root here. The humiliation of being ruled by an alien country was so predominant in the minds of the leadership that other aspects of the practice of democracy were conveniently ignored, or at best ill implemented or adopted with reluctance. This naturally had an impact on neighbouring areas which were either ruled by a foreign power or an indigenous power in agreement with the colonial power. The democratic experiments carried out by the national government of India largely effected and have greatly determined the perception of democratic government in the neighbouring countries. Unfortunately in the last analysis the predominant compulsion of politics in India today is to stick to the 'gaddi' by all means. This has encouraged the free use of money and muscle power to obtain the 'consent' of the citizens to rule. This process has distorted democratic values.

Nepal successfully overthrew the Rana autocratic regime which was in the process of collapse any way with the departure of the British power in India in 1951. This movement generated high hopes of the emergence of democratic culture among the people. Everybody thought that the party instrumental bringing about the 'revolution' would do something to initiate and educate the people about democratic norms and culture. But it failed to do so. This was one of the reasons why when the first Nepali Congress government which had won by an overwhelming majority in first general

election was summarily dismissed and its leaders put behind the bars in a royal coup by the late King Mahendra in 1960, no voice was raised against the action.

Between the royal coup of 1960 and the successful movement for the restoration of democracy last year, 30 long years have passed. The people naturally believed that the political parties have learnt their lesson and remembering the past would make determined efforts to encourage the establishment of democratic norms and processes. But the year that has passed gives no indication of any such thing. The old style political bickerings are again visible and the extensive use of muscle power and money has replaced whatever political ideals the parties have been harping about in the last 30 dark years of party-less Panchayati Raj.

With the general election scheduled for May several incidents in various parts of the country indicate that the democratic process matters very little here. Reports of violence and attacks on opponents have become so common that the people have begun to accept it as a part of the political game.

Though voluminous manifestos have been issued by various political parties they do not seem to have touched the core problems of the people. Slogans which sound good are hardly ever translated into reality which is evident from the fact that promises made by the interim coalition government to the people have only remained on paper in last 12 months. The government's promise to curb and control the prices has had little impact: the price rise during the period has been 50 per cent. The government's determination to eliminate corruption and give a clean and efficient administration has proved to be a mirage. Corruption is more visible now than in the ousted panchayati regime and administration is virtually at a standstill. The law and order situation has worsened and citizens are dismayed to hear that they themselves are responsible for their safety and security.

It is against this background that voters are scanning the election manifestos of

political parties. The leaders of various political parties having failed to reassure the people and have taken recourse to the old style of manipulative politics. Though the election manifestos make brilliant promises they do not spell them out in concrete terms. All parties have tried to incite base emotions of people for their party's benefit ignoring existing ground realities. Some parties, like the Nepal Communist Party (United Marxist Leninist Party or UML) have called for the scrapping of the Indo-Nepal peace and friendship treaty of 1950 and stoppage of recruitment of the Gorkha soldiers into the British and Indian army ignoring the economic consequences it entails. Though it is largely realised that the water resources should be harnessed to the benefit of both the countries, India and Nepal, and the lapses in the past in this connection should be corrected through mutual understanding, two parties, UML and the Rashtriya Prajatantra Party (Chand) have stated that there would be no question of sharing Nepal's water resources with India. This thinking in itself is absurd as the vast power resources of the kingdom are going waste much to the disadvantage of the people of both countries and most people here including, ironically enough, the people who have drafted the manifesto, maintain privately that properly planned use of water resources would bring immense benefit to both the countries.

Though various promises on bold lines have been made in the manifestos for the welfare of the ethnic groups and the people of both the 'terai' and hilly regions, they have failed to convince them about the parties' seriousness on the issue. Prominent parties have for instance, failed to establish their good intentions—evident from the distribution of tickets for the forthcoming elections. So long as various ethnic and regional groups are not assured and taken into confidence the process of nation building will suffer and the situation may even threaten the national integration of the kingdom. Ethnic groups and regional organisations, are, therefore, making a determined bid to win maximum number of seats in the election and make a strong presence in the next parliament.

As the situation prevails today the Nepali Congress, though the oldest and largest political party in the kingdom has failed to gain the confidence of the people and it is the United Marxist Leninist Party popularly known as UML which, with disciplined cadres and well-knit organisational cells in the hills and the 'terai' which seems to be heading for success.

The other parties between them have

also areas of influence and strong bases of their own. For instance Rashtriya Prajatantra Party, RPP (Thapa); and the Nepal Sadbhavana Party will bag many seats on their own and in many constituencies their presence will cause the defeat of Nepali Congress candidates.

This, it is said, has alarmed the South Block in New Delhi and they are reportedly working towards a patch up among the three parties. The anguish of the people of the 'tea' is mounting so much that observers are apprehensive of a situation similar to that in Sri Lanka unless satisfactory rational efforts are made at the top

levels and the situation stopped from deteriorating further. The Left organisation in Nepal being inclined towards China the South Block seems to have been alarmed and is reportedly going out of its way to help the democratic parties materially as well. The red wave of the early 1950s which resulted in the victory of the Left combine in the local election is still obviously casting its shadow on South Block. This could have a far-reaching impact on the Nepalese psyche and strong reactive nationalism may sweep over the kingdom which may in turn result in strong anti-Indian feelings.

Uneven Benefits of German Unification

Hemen Ray

In 1989 all warnings that a rapid monetary union of the two Germanies would spell disaster were brushed aside impatiently. Today, some of these warnings may be coming true

THE euphoric hope that the former GDR would lead Germany to a new economic miracle making the nation the strongest economic power of the world has suddenly vanished. Instead of becoming the golden nest of German economy, East Germany has become an economic graveyard with the German nation divided into a prosperous and economically booming west and a pitiable dilapidated and hopeless east.

The reckless dream of the East Germans of jumping into a luxurious life soon after the introduction of the German mark has burst like soap bubble. The magnetic power of the German mark that electrified East German population to vote for the unification of Germany has withered away. Their hope that mere possession of the German mark would enable them to acquire the glittering West German living standard has proved fruitless. They are today as poor as they had been during the past 40 years under communist rule. They are embittered, despondent and dismayed and do not understand that they should work hard to raise their living standard. A recent remark by Karl Poehl, president of the Federal Bank that the German mark, that everyone in the world wants to possess, is the 'main cause' of the economic 'disaster' in East Germany have shocked the East Germans. They now openly question the benefits of the unification of Germany to the East Germans.

The market economy has created many problems. The factories are collapsing one after another. Others, which still function, are drastically reducing their personnel. There is a threat of mass employment and life has become expensive. West German industries, the hope of East German economic

development, have adopted a wait and see policy. The German mark and the market economy have turned East Germany into a poorest part of the richest nation.

With each passing day, East Germany is sinking into an economic morass. Fear, frustration and hopelessness have gripped the entire population. The economic woes have also had dramatic consequences. More and more East Germans are committing suicide because they have lost their jobs and because they cannot pay their debts and see no future. In 1990 a total of 4,292 people committed suicide in East Germany and the number is growing each day.

The disparities between rich and poor has created social and political unrest. It has demolished East Germans' faith in Chancellor Kohl and his government. According to the latest opinion poll 82.5 per cent East Germans are disappointed with the Bonn government because of its failure to offer them the luxurious life they expected after the unification. For the first time since the unification of the country, hundreds and thousands of dissatisfied East Germans have gone to the streets to protest against the economic misery and particularly against Chancellor Kohl for his 'failure to keep his promise'. Thousands of jobless East Germans are also migrating to West Germany in search of jobs and better life as they have done during the past 40 years. According to the Institute of German Economy in 1990, 4,80,000 East Germans migrated to West Germany. This year one million or more East Germans are expected to migrate in search of jobs and shelter. In addition 4,00,000 commute to work in West

Germany for six marks an hour while a West German worker earns 40 marks an hour for the same job. Every fifth person in East Germany is today jobless and the number of unemployed is expected to rise to four million by the summer of the year. The Institute warned that "if chances are not offered soon to remove the current hopeless situation, a social conflict with serious consequences is inevitable". According to an East German politician the growing number of jobless persons and the social discrepancies have created a 'dangerous' situation. "It is like a dynamite that can explode any moment. East Germany is heading toward a serious confrontation. The prices of all foodstuffs have gone up to West German levels, while the income of the people constitutes less than 50 per cent of West Germany. The financial apartheid is responsible for the social unrest."

In 1989 when communism fell apart, many East Germans endeavoured to persuade the Bonn government to support the East German mark for a stable economy. But their suggestion was curtly rejected. Even the appeal of the president of the Federal Bank for a gradual conversion of East German mark remained unheard. Warnings by economists and financial experts of the devastating consequences of an early monetary union were dismissed as idle talk. Nine months after the monetary union, the consequences of financial apartheid are visible everywhere. A Berlin newspaper commented that "the people of East Germany, who have been promised a glittering edition of an economic wonder in the West, have been cunningly deceived. The East Germans can now express their heartfelt thanks to the Bonn authorities for their miserable economic situation."

The gigantic financial experiment of the century to restore ailing East German economy has confronted the Bonn authorities with many invisible problems they did not dream of earlier. Many people believe that the magical power of the German mark and the market economy will not solve the East German problems. Others tend to the failure of the Bonn authorities to rebuild East German economy as a harbinger of an unstable era. Bonn's finance minister Theo Waigel warned that Germany finds itself in 'the midst of a crisis' and called the East German problem a 'psychological issue'. The pessimists recall that November 9, the day communism toppled in East Germany, was the most inauspicious day in German history. It was on November 9, 1918, that Germany capitulated. On November 9, 1923, Adolf Hitler set up his National Socialist Movement, which a few years later entangled Germany in the bloodiest war in its history, besmirched its name and divided the nation for more than 40 years. They now fear that history might repeat and Germany might march toward a new economic catastrophe—the third in a century.

Technology in Third World

Bernard D'Mello

Technological Advance in the Third World: Strategies and Prospects by M R Bhagavan; Zed Books, London, 1990; pp xii + 156, price not stated.

THERE are enormous differences in the technological capabilities of countries comprising the Third World. And given the considerable political, economic, social and cultural diversity, one might question the utility of formulating general strategies of technological advance. M R Bhagavan has tried to circumvent the problem by classifying Third World countries into four categories depending on the degree of industrialisation and technological self-reliance.

Bhagavan first sets out rather neatly the characteristics that distinguish the three industrial-technological revolutions that have occurred since 1760. The leading sectors of the first revolution (1760-1860) that took place in England were textiles and iron and steel with steam as the major motive power. The leading sectors of the second revolution (1860-1960) that took place in Germany, US, UK and France were steel, railway equipment, automobiles, chemicals (in particular synthetic dyes and plastics), electrical equipment and synthetic textiles with electricity and petroleum as the major energy sources. The leading sectors of the third revolution (1960 onwards and still underway) that began in Japan and the US are telecommunications, aerospace, computers, microelectronics, informatics, robotics, biotechnology and new materials (e.g. optical fibres). The author labels the technologies of the three successive industrial-technological revolutions 'early modern technology', 'standard modern technology' and 'highly modern technology'. The degree of automation, science-relatedness and research intensity increase as one moves down the line from early modern to highly modern technology. The dominant skills and dominant innovators change from arts and crafts and master craftsmen/ingenious mechanics/individual engineers to engineers and scientists in R and D departments to more specialist scientists and engineers in R and D departments.

The degree of technological self-reliance among Third World countries is defined with respect to 'standard modern technology' since these countries have not yet made much headway in highly modern technology. The author posits an almost complete correspondence between the degree of industrialisation and the degree of technological self-reliance. As already mentioned, Bhagavan classifies Third World countries into four categories according to the degree to which they possess these qualities. Category 1 is that of 'industrialis-

ed, technologically highly self-reliant' countries. Brazil, China, India and South Korea qualify. Category 2 is that of 'industrialised, technologically nearly self-reliant' countries. Argentina, Malaysia, Mexico and Turkey qualify. Category 3 is of 'semi-industrialised, technologically partly self-reliant' nations. Algeria, Chile, Egypt, Ecuador, Indonesia, Iran, Peru, Philippines and Venezuela qualify. Category 4 is composed of the 'non-industrialised, technologically totally dependent' countries like Bangladesh, Cameroon, Ghana, Jamaica, Kenya, Libya, Nigeria, Saudi Arabia, Tanzania, etc. The sample is of 31 countries. There is a reference category of some highly industrialised and technologically highly developed countries of the 'West' and 'East' like West Germany, Italy, Japan, US, UK, Czechoslovakia, East Germany, Hungary and the USSR.

Categories 1 to 4 are defined with respect to manufacturing output as a percentage of GDP, value added in capital goods as a percentage of total value added, value added in the machinery sector as a percentage of value added in manufacturing, net domestic output of capital goods to consumer goods, stock of technicians, engineers and scientists in the economically active population, manual workers in industry and services as a percentage of the economically active population, capital goods imports to consumer goods imports and machinery imports to total capital goods imports. For instance, a country is 'industrialised' if manufacturing output as a percentage of GDP is greater than 15. The same country is technologically highly self-reliant in production if value added in capital goods as a percentage of value added in manufacturing is greater than 30, value added in machinery as a percentage of value added in manufacturing is greater than 15, net domestic output of capital goods to consumer goods is greater than 1, imports of capital goods to consumer goods is greater than 1.5, and so on. According to these criteria Brazil, China, India, South Korea, Argentina, Malaysia, Mexico and Turkey are 'industrialised' and the first four of them are 'technologically highly self-reliant'.

The proportion of GDP in manufacturing, as we know, often overstates the degree of industrialisation in Third World countries since manufacturing activity in domestic money terms is inflated due to inordinately high prices with tariff protection. I say this because the author has used the data of the 'highly industrialised' countries as a reference category. The proportion of the

labour force in industry and/or manufacturing (ISIC divisions 2 and 3) is more reflective of qualitative, structural change that industrialisation implies. If such a criteria is used then the industrialisation process of large-sized economies such as India and China which have very high ratios of the working population engaged in agriculture would have to be evaluated differently from that of medium-sized economies such as South Korea and Taiwan. A country such as China, which has experienced a trend rate of industrial growth of 10 per cent since 1949 and where the share of industry in national income rose to 42 per cent in 1982 still had 72 per cent of its economically active population in agriculture, forestry, etc. in the same year. In contrast, medium-sized economies such as South Korea and Taiwan which have had very high rates of industrial growth have experienced a major shift in the structure of their labour forces towards industry. Of course, statistics on the structure of labour forces in Third World countries are not very reliable. Even if we take Bhagavan's UN statistics of distribution of GDP we find that his so-called industrialised countries such as Brazil and India have not made any significant progress between 1965 and 1984 in terms of the share of industry and manufacturing, whereas a medium-sized economy such as South Korea has.

Technological self-reliance is actually a refusal to accept an unequal international division of labour and an ability to change it. Here analysis of the evidence is complex, for the capitalist centre holds on to its gains not in a static sense, but dynamically, by concentrating on strategic technologies as they emerge. The capitalist centre thus relinquishes at a price, the technologies of a whole set of consumer, intermediate and capital goods for economic reasons. A changing international division of labour is determined largely by the capitalist centre. The question is of finding out the extent to which the capitalist centre relinquishes these technologies and industrial branches in its own long-term interests and the extent to which it concedes due to the political-economic strength and capability of the Third World countries. Statistics of the kind marshalled by Bhagavan tell only part of the story and may even be misleading. For instance, Korea has been heavily dependent on Japanese components and technology in consumer electronics, computers and automobiles. Hyundai's car, the Excel, has its transmission designed and produced by Mitsubishi in Japan, its engine designed in Japan; its body style is an Italian design, and so on (see *Multinational Monitor*, November 1989, pp 13-14). In fact, in UN statistics, South Korean output of cars and commercial vehicles is classified under 'assembly' and not 'production'. Intermediates in fact do not figure in Bhagavan's ratios that osten-

ably show the degree of technological self-reliance. And, if one were to go by his indicator of industrialisation, then, certain large regions of colonial India may have been industrialised before the onset of 'de-industrialisation', under British capitalist colonialism!

Further, in the 1980s in India five of six fertiliser plants to be set up (some already set up) along the HBJ pipeline—at Gadepan (Rajasthan) (K K Birla Group), Guna (NFL), Jagdishpur (Aditya Birla Group), Aonla (IFFCO) and Babrala (UP) (Tatas)—have 'opted' for the design, engineering, etc, of Snamprogetti-Haldor Topsoe. Part of the detailed engineering (that too under the supervision of Snam) and some routine project work is being done by an Indian public sector engineering firm. These projects will certainly further increase India's self-sufficiency ratio in fertilisers. But is this what we mean by technological self-reliance? Bhagavan should have examined (a) the attitudes towards foreign capital, (b) the conditions under which technology imports are/were permitted, and (c) the concrete measures taken to foster indigenous technology in South Korea and India, his so-called technologically highly self-reliant countries.

The author hits the nail on the head when he recommends strategies for the rapid growth of the domestic market for manufactured products for achieving technological advance. The growth of exports of manufactured goods is more difficult, for a lot of Third World countries are competing for shares in roughly the same export markets and the change of shares in those markets is slow and uncertain. It is therefore the growth of domestic demand for manufactures that in general, distinguishes one Third World country's growth of demand for manufactures from the other. And technological advance in manufacturing is a function of the growth of demand for manufactures as Nicholas Kaldor has shown (*The Causes of the Slow Rate of Growth of the UK*, Cambridge University Press, 1966).

Bhagavan does not relate the growth of demand for manufactures to the choice of technology and therefore employment. The choice of technique debate, I feel, is still important, for manufacturing output has grown rapidly in developing countries since the 1950s but yet, outside the 'socialist' Third World countries, the growth of employment has stagnated. Bhagavan does say nice things about Maoist China's 'walking on two legs' strategy but his account is devoid of any analysis.

In discussing strategies for technological advance in highly modern technologies like telecommunications, computers, biotechnology, etc, Bhagavan falls into the orthodox trap of emphasising huge R and D outlays, economies of scale in innovation, alliances with TNCs (p 87) and so on. If the Japanese had followed orthodox economic rationalism, they would never have established industries such as steel, petrochemicals,

automobiles and computers and eventually become first rate in them. Competing with TNCs in oligopolistic markets is however not being suggested. It should be remembered that a significant proportion of the R and D outlays of Western TNCs is accounted for by the fact that they are in oligopolistic market structures where risks are high and there is duplication of effort. Surely a Third World country can avoid such expenditure. C-Dot (Centre for Development of Tele-matics) in India, with financial support of less than Rs 50 crore over five years, *protection from imports* and a fair degree of autonomy (for a while), was able to successfully develop and market small telecom switching equipment like EPABX, RAX, etc, and even developed a prototype of a 16,000 port digital electronic exchange, all in five years' time. Committing very large sums towards R and D is not always necessary for success.

In discussing China the author recommends both Maoist as well as post-Maoist technology strategies. He discerns a "continuity in the strategy for raising the technological level of the masses" (p 97). The differences are however not adequately dealt with. It is true that the strategy of 'walking on two legs' has been continued. Rural industrialisation has gone much further and village and township industry now employs more than 100 million persons. But in the 'modern' sector, the emphasis seems to have shifted from import-substitution of technology to achieving economic and technical efficiency. For instance, the Volkswagen Audi-100 and Audi-200 are local only in

name (*Beijing Review*, 38, 1989, p 8 quoted in Nirmal K Chandra, 'Crisis in China: End of Socialism?', *EPW*, November 18, 1989, p 2555). Indigenous technology in the 'modern' sector does not seem to be progressing in the post-Maoist period. (I have so far not come across any evidence to the contrary.)

A factual error in the book is Bhagavan's assertion that the Japanese colonialists were responsible for implementing land reform in Korea (p 97). Actually, it was the US occupation force that was responsible for the land reform in South Korea (Eddy Lee 'Egalitarian Peasant Farming and Rural Development in South Korea' in D A Gha et al (eds) *Agrarian Systems and Rural Development*, New York, Macmillan, 1979). In fact, the US occupation forces were responsible for land reforms in Japan too (more radical land reform than the earlier one).

The book is highly readable (superb copy editing?) but leaves one with a sense of disappointment at the simplistic and cursory manner in which important issues are handled. Given the wide exposure of the author to problems of industrialisation and technology in Africa and India one expects a deeper analysis. After all, success at import substitution (France and Japan after the war) and/or export expansion (Italy and West Germany after the war) have clearly been associated with technological advance

[I benefited from a discussion with Nirma Chandra of some of the issues raised here. However, the viewpoint is entirely my own.]

THREE DELTAS

Accumulation and Poverty in Rural Burma, Bengal and South India

WILLEM VAN SCHENDEL

Commonly held notions about poverty treat it as a 'natural' problem of scarcity—a temporary state which will disappear once an economy grows and resources become plentiful. However, in this unique book, Prof Willem van Schendel argues that the transition to modern mass poverty cannot be attributed simply to natural scarcity, backwardness exacerbated by population growth, or colonial capitalism, but is primarily the outcome of unequal relations between groups of people.

Prof Van Schendel bases his conclusions on an exhaustive comparison of three rural societies in Asia between the 1750s and 1980s. Using a wealth of material, both published and unpublished, he provides a detailed analysis of the historical development of relations of 'primary' surplus extraction in Lower Burma, Bengal, and the Kaveri delta in southern India.

COPING WITH INFLATION

The Experience of 1990

By S.M. Datta, Chairman, Hindustan Lever Ltd.

At the end of the Eighties, we could look back with satisfaction on the remarkable increase in the growth rate of the Gross Domestic Product to an annual average of 5.5 per cent. A satisfactory growth in agricultural output, combined with an average growth rate of over seven per cent in industrial production, kept prices in check. The average rate of inflation in wholesale prices, which was a little over eight per cent in the first half of the decade, dropped significantly to seven per cent in the second half. The resilience in the economy was adequately demonstrated when the severe drought of 1987-88, following as it did upon two relatively poor monsoons, did not lead to a sharp escalation in prices.

After a sedate start, however, the past year has brought into question all our economic assumptions. The annual point-to-point inflation rate, based on the Wholesale Price Index, moved into double digits by September, 1990. The last three months of the year did not show the expected seasonal decline in the prices of agricultural commodities and by the end of the year the inflation rate had reached nearly 12 per cent.

FACTORS OF INFLATION

The unfolding drama in the Middle East provided the most visible reason for this inflation. Our country depends upon imports for as much as 40 per cent of its requirement of petroleum products and this dependence is increasing as a result of the gradual decline in domestic production. The administered price increases of March, 1990, and the 25 per cent Gulf surcharge imposed in October did succeed in curbing the growth in consumption but the combined effect served to increase the inflation rate by 1.5 percentage points. The full impact of this escalation on the consumer prices will undoubtedly be higher and is yet to be fully realised.

The real impetus for inflation, however, was provided by the sharp increase in the prices of primary products, derived from agriculture by as much as 16.5 per cent over the year. This factor alone accounts for nearly half of the total inflation in wholesale prices. The administered increases in the minimum support prices for various crops have contributed significantly to this price increase. Another major factor has been the sharp spurt in the prices of edible oils and pulses due to our inability to import sufficient quantities of these essential commodities. The inflationary spiral has been further accelerated by the nearly automatic indexation of wages and salaries with the inflation rate.

While inflation is an extremely complex phenomenon, it is clearly influenced by the growing fiscal imbalance in the administration of the economy. Public attention is usually confined to the Budgetary Deficit, which is somewhat narrow in its definition. Even so, the recurring deficits in the last three years alone have amounted to a total of over Rs 27,000 crores. Excessive liquidity of this magnitude can only serve to fuel inflation, especially when the deficits arise from consumption-oriented non-Plan expenditure. It is, therefore, particularly pleasing to note the positive response of organised industry which contained the costs and restricted the rise in the index of Manufactured Products to less than eight per cent.

The cost of materials consumed constitute nearly two thirds the total nett sales value generated by Hindustan Lever. About 60 per cent of the materials consumed are industrial intermediates, which include chemicals, paper and board, packaging and other similar manufactured goods. The remaining 40 per cent are of agricultural origin, mainly consisting of oils and fats but also other similar items such as tea, rice and seeds. Therefore, the increase in material costs due

to inflation had created a sustained upward pressure on the overall costs, which was further enhanced by the increase in energy and transportation costs arising from the fuel price increases mentioned earlier.

The economic scenario in 1990, however, was not a picture of unrelieved gloom; there were several bright features as well. The country experienced the third consecutive year of good rainfall in 1990 and the agriculture sector responded with a further sizeable increase in output. The increased support prices pushed up the estimated value of agricultural output by more than 16 per cent to a record level of Rs 123,400 crores. The industrial sector, too, maintained the growth rate of eight per cent achieved during the Seventh Five Year Plan.

HINDUSTAN LEVER STRATEGY

Consequently, the year witnessed an upsurge in the demand and consumption of consumer non-durables in general and, more particularly, of the daily necessities which constitute the bulk of Hindustan Lever's output. We, therefore, decided to utilise this enhanced rate of market growth to generate a sharp increase in volumes as our first defence against the upward pressure of costs.

As the growth in consumption was the largest in the rural markets, we had to reorganise our distribution system to efficiently and economically serve a significantly larger number of widely dispersed communities. The consumer preference in terms of product presentation and pack sizes had to be determined and the necessary adjustments had to be made in the manufacturing programme. The experience gained earlier in the area of rural communications and consumer contact for the marketing of fertilisers and seeds was not only utilised for increasing the sales of agricultural inputs but also harnessed in the task of developing the market for consumer goods.

Equal importance was accorded to the urban markets as well. The programme for servicing retail outlets was thoroughly overhauled in order to cater more efficiently to the requirements of a significantly larger number of outlets, not only in the larger cities but in the small and medium sized towns as well. The communications programme was redistributed over the improved choice of available media in order to contact consumers more effectively. The product portfolio, too, was expanded and refurbished in response to consumer needs which were measured and monitored through a broader programme of Market Research. The more than 20 per cent increase in physical volumes which we experienced in 1990 as a result of these efforts has helped to offset in large measure the increase in costs, more particularly the fixed costs, by spreading them over a larger output base.

MANUFACTURING OPERATIONS

A second measure of defence against cost increases devised in 1990 lay in harnessing our process technology resources in order to improve the reliability of machinery and the quality of output. Manufacturing operations were simplified to eliminate unnecessary equipment. Systematic fault diagnosis methodologies, such as Condition Monitoring, were employed to improve the functioning and the performance of production lines. Measurements of line efficiencies revealed bottlenecks, the removal of which led to a significant increase in throughput rates. Quality assurance measures were integrated with manufacturing operations in order to bring down rejections, and consequent reprocessing costs.

Simultaneously, the training and skills development efforts were stepped up as a measure to further enhance the capability of the operating staff in the factories. All these efforts culminated in the achievement of a 20 per cent increase in nett sales value with a less than 10 per cent increase

in the value of fixed assets. So, it was possible to reduce the impact of manufacturing costs on the overall cost profile of the company.

INVENTORY MANAGEMENT

Borrowings constitute a significant, and important, source of funds for business operations. In Hindustan Lever, too, secured and unsecured loans contribute over a third of the total deployment of funds. Bank borrowings in India have seldom been cheap and, of late, increases in interest rates have accentuated the cost of such borrowings. Since loan funds are primarily deployed for financing working capital, it became necessary to devote attention to inventory management as a means of containing costs.

We maintain a direct distribution system for reaching our products even to the remotest parts of the country which means that a minimum quantity of stocks has to be maintained in the pipeline to ensure uninterrupted supplies. The inventory management issues are even more complex in the case of agri-inputs whose sales are highly seasonal in nature. The distribution system was subjected to a thorough review as a result of which a revised methodology was implemented to reduce the supply planning cycle by taking advantage of the modest improvements in the telecommunications system. Thus, it has been possible to improve the servicing level as well as reduce the minimum requirements of working capital in the finished products supply chain. Further refinements are undergoing tests before they are fully implemented. The movement of chemicals and packaging materials to the large number of manufacturing establishments has been streamlined and tighter linkages have been established with selected suppliers in order to reduce the quantum of minimum stocks which needs to be retained at the various factories to ensure uninterrupted production runs.

The seasonal nature of the availability of oils and fats makes it necessary to tie up appreciable amounts of working capital in stocking adequate quantities to maintain the production activities around the year. Long standing research and development efforts aimed at the exploitation of non-traditional oils have resulted in a broader basket of choices in these areas. It has, therefore, become possible to smoothen somewhat the peaks and troughs in the seasonality of oil purchases which has had a beneficial effect on inventories. Advantage has been taken of the recent advances made by the engineering industry to reduce the inventory of spares and components. Similarly process flows have been streamlined to reduce the hold-up of materials and intermediates within the manufacturing system.

The success of these efforts is demonstrated by the fact that inventories recorded a growth of only 18 per cent, despite the higher replacement costs, although the turnover increased by 20 per cent. An even better indicator of the management of working capital, as well as of the improved management of funds, is the interest cost which increased by only 4.5 per cent.

MATERIALS CONSERVATION

The major part of the cost control effort, however, was directed towards conserving the cost of materials, where significant economies were achieved not only through more efficient utilisation but also through suitable substitution measures. The most appropriate example is, perhaps, presented by the consumption of oils and fats. Firstly, by exercising the wider choice of raw materials made available through technological efforts, it was possible to prevent an increase in the average cost prices. Secondly, although production of soap increased by 24 per cent, the consumption of oils and fats went up by only 14 per cent. This conservation measure was a direct outcome of the application of the structurant technology derived from Research insights into the functionality of the various components present in a tablet of soap. On an average this technology resulted in the cumulative saving of about 30,000 tonnes of oil per annum, an amount which is significant even in the context of the national oil economy.

VALUE ANALYSIS

The cost reduction effort has been a sustained one. It encompasses all aspects of the company's operations and involves the application of Value Analysis techniques to every significant item of cost.

The effort is based on the acquisition and application of knowledge, of materials and functionalities arising from Scientific Research, of consumer attitudes and perceptions arising from Market Research and of operational systems arising from Business Research. The cost control effort has succeeded in improving the perceived value of the products and has contributed significantly to the increased volumes achieved last year.

BENEFIT TO CONSUMERS

Employing this multilateral approach to the problem at hand, it has been possible for Hindustan Lever to restrict the average level of price increases in its finished goods during the year to well below five per cent. In the case of major brands, such as Lifebuoy, the price variations have been even lower. This benefit to the consumer was not achieved at the expense of the employees, who participated fully in the efforts mentioned earlier and enjoyed better working conditions and emoluments. Nor has it adversely affected the shareholders, because the 20 per cent increase in turnover has resulted in a 24 per cent improvement in Profit Before Tax. Despite a 30 per cent increase in the tax liability, part of which was due to the increase in the surcharge as well as to the changes in depreciation allowances, the net profit after tax has recorded a 20 per cent increase, which is exactly in line with the growth recorded in the turnover.

The modest success achieved in 1990, however, should not lead to complacency because a task of even greater magnitude lies ahead. The domestic fiscal imbalance continues without correction under the influence of sharply increasing non-Plan expenditure and debt servicing obligations. Inflation, if allowed to continue unchecked, will eventually decelerate consumption, which is the ultimate engine for growth. The options for correction are not easy because a reduction in subsidies will be extremely unpopular, while massive doses of taxation will be good neither for industry nor for the consumers. Draconian measures are needed to restrict the growth of imports but these are already putting brakes on the industrial growth rate. Therefore, the greatest value that one can attach to the experience of 1990 perhaps lies in the guidance which it may give us in navigating the troubled waters which await the business in the current year.

NATIONAL PERSPECTIVE

The rich experience that Hindustan Lever has earned in the course of managing inflation at the micro-economic level may also be drawn upon to suggest steps which will prove beneficial at the macro-economic level.

The encouraging growth in both the output and value of agricultural products gives an opportunity to better integrate that sector with the whole economy. To begin with, efforts should be made to widen the scope and range of savings, through specially formulated schemes for the rural population, so that there is a matching increase in the volume of funds available for investment. Simultaneously, productivity of the very large investments already made should be improved, taking advantage of the present deceleration in the pace of public investment expenditure. The recently enhanced bank rates should be supplemented by suitable fiscal incentives to foster an improvement in inventory management at every level in the economy.

On the infrastructure front, the rail and road transport systems should be made more complementary to each other for removing the bottlenecks that frequently hinder the movement of freight traffic. Last but not the least, the various industry related Development Councils and the corresponding CSIR laboratories should put their heads together to the task of reducing costs and upgrading quality in the manufacturing sector.

The best way, therefore, of managing and controlling inflation in the economy will be to create a policy environment and plan perspective to permit the fullest latitude to the productive forces and competitive trends latent in our economy.

This is the text of the speech delivered at the Annual General Meeting of Hindustan Lever Ltd., held in Bombay on 3rd May, 1991. If you wish to obtain this speech in a booklet form, please write to: The Communications Department, Hindustan Lever Ltd., P.O. Box 409, Bombay 400 001.

husband—she displays a rare sensitivity to how the proximity to power and ideology can distort, if not corrupt. Her failure, though, lies in her inability to bear witness to the self-limiting social nature of the modern elite, including the best amongst them. She never questions the self-assumption of their right to rule, plan and remake this society. It would seem that for her none else, outside the charmed elite, in this society is equipped and located so as to be free of the tyranny of the past—able to deliver this ancient country into modern times.

Maybe, this is why so few of this set ever felt constrained by the ends and means dilemma. The country was crying out to be transformed and the urgency was all too evident. Compunctions about procedures could not be permitted to block the march to progress. After all these were good people engaged in doing good to the country!

It is only through such rare anthropological accounts of the social elite that we may begin to understand why even the circle of dissent that marks our capital city is so hollow. For the dissenters and the rulers are joined together in a common cultural enterprise—they just happen to be joined on opposing sides. The ostensible sharp difference of opinion aired in the comfortable environs of the India International Centre, the various university fora or the Nehru Memorial Museum and Library can easily be dissolved in the evening round of socialising. All that needs to be ensured is that no whiff of 'another India' enters this charming and graceful world.

To be fair, there are stray passages in the book that indicate that Raj Thakur was not oblivious of this predicament—the structural mental block so intrinsic to our modern elite. Her recognition of the ingrained sense of dignity in masses that resulted in the historic 1977 electoral verdict, her impatience with the Communist Party leadership's preoccupation with itself, an abstract proletariat and a global situation when their knowledge of the concrete Indian reality was so shallow, her coming to realise how her ideology and power can play with one's memory, one's integrity, almost unconsciously, or even her later priding appreciation of Gandhi the Mahatma and his call for austerity and his larger historical project—these are clearly some of the instances where one discerns an attempt on her part to rise above herself as a social archetype. But overall, the dominant tenor of the narrative reveals a deep fascination for and sympathy with the elite world of the Nehru-Gandhis, a regret that the dreams of her early years lie shattered. The gut level disgust with this cow dung world, the discomfort with which the others of one's own culture are looked at can never be effectively buried. In more ways than one, *All My Years* remains a story of this regret, of the inability of the best of our modern elite to come to terms with themselves.

NOTICE

EWAC ALLOYS LIMITED

It is hereby notified for the information of the public that EWAC ALLOYS LIMITED proposes to make an application to the Central Government in the Department of Company Affairs, New Delhi, under sub-section (2) of Section 22 of the Monopolies and Restrictive Trade Practices Act, 1969 for approval to the establishment of a new undertaking/unit/division. Brief particulars of the proposal are as under:

- Name and Address of the applicant**
EWAC ALLOYS LIMITED
L&T House
Narottam Morari Marg
Ballard Estate
Bombay 400 038
- Capital structure of the applicant organisation**
Authorised
7 00 000 Equity Shares of Rs. 100 each
Issued and subscribed
2 56 000 Equity Shares of Rs. 100 each
Rs. 1 00 00 000
Rs. 2 56 00 000
- Management Structure of the applicant organisation**
indicating the name of the director including the Managing Whole time Director and Manager if any
The business and affairs of the Company are managed by the Manager subject to the superintendence, control and direction of the Board of Directors

Director:
1. Mr. U. V. Rao
2. Mr. S. R. Subramanian
3. Mr. D. Kulkarni
4. Prof. Dr. H. R. D. Wasth
5. Mr. F. Balchandani
6. Mr. G. Roth
7. Mr. Paul A. Kammer
8. Mr. T. Pooran (alternate for Mr. S. Roth)

Manager:
Dr. Naval N. Katarik (Designated Chief Executive)
- Indicate whether the proposal relates to the establishment of a new undertaking or a new unit/division**
The proposal relates to the establishment of a new unit/division
- Location of the new undertaking/unit/division**
Ankleshwar Dist. Bharuch Gujarat State
- Capital structure of the proposed undertaking**
No. of new undertaking proposed to be set up
1
- Indicate the proposal relates to the production, storage, supply, distribution, marketing or control of any goods/articles indicate:**
(i) Name of goods/articles: Specially formulated quick setting compounds for cold repair and maintenance applications
(ii) Proposed licensed capacity: 120 Tonnes per annum
(iii) Estimated annual turnover: Rs. 185 lakhs in the fifth year after commencement of production
- Indicate the proposal relates to the provision of any service, state the volume of activity in terms of usual measure, such as value, income, turnover, etc.**
Not applicable
- Cost of the project**
Rs. 90 00 000
- Scheme of finance indicating the amounts to be raised from each source**
The entire cost of the project will be met from the internal cash generation of the Company

Any person interested in the matter may make a representation in quadruplicate to the Secretary, Department of Company Affairs, Government of India, Shastri Bhavan, New Delhi, within 14 days from the date of publication of this notice, intimating his views on the proposal and indicating the nature of his interest therein.

Dated this 22nd day of April 1991

East European Developments

Impact on Trade of Developing Countries

R G Nambiar

Rajesh Mehta

G A Tadas

This article makes an attempt to evaluate the potential impact of East's entry into the 'global economic zoo' on developing countries particularly from the standpoint of latter's trade opportunities in the nineties. The East's entry into the world's 'free markets' appears to have ruinous ramifications for developing countries' trade. There are two circumstances which reinforce this conclusion. The first is the findings of the 1980s which show a firm trend of trade diversion that has already begun to flush out the developing countries not only from the markets of North, but also from its own markets. The second circumstance is the apparent tendency for the structure of intra-East Europe trade to be very similar to the export structures of the developing countries.

Introduction

SO much has been happening in the geopolitical environment as the eighties drew to a close, so many new and totally unpredictable developments, that it is difficult to say what tomorrow will bring, as forces, evil or beneficent, when once set in motion move with accelerated speed to their natural conclusions. Who would have thought, for instance, that half of Europe would shuck off its four-decade old communism? Who would have thought that the great 'command economies' of the world will switch over to 'demand economies'? Who would have thought that the elements of market place economics would kick in the womb of mother Russia? Who would have thought that the Warsaw Pact powers would begin their journey to a common European home? Who would have thought that the East-West conflict which dominated the post-war era would become a self-liquidating ideal in the nineties? And yet, these are no more than indicative of the direction and magnitude of the changes which are wrought upon the global landscape. In sum, as the world enters the last decade of the twentieth century, it bears testimony to the birth of a new global era, marked decreased divisiveness, diminished ideological hostility and defunct superpower tension, and the key to all these is, of course, the disintegration of the allegorical second world.

All these cataclysmic changes in the European polity, however, contribute to a harassed outlook to poor and developing countries of the South. For one thing, they see East's entry into the 'global economic zoo' as a potential threat to their interests. Economic strategists here continue to worry over a heady mixture of possibilities: Will the six nations of Europe, who were until now considered all but extinct in the world's free market challenge the developing countries' ascendancy in the global trade when

the former starts prowling outside their own neighbourhood? Will the East-West axis, which is gaining enough substance, result in evaporation of Western economic assistance to the developing countries? Will the East's opening up stifle investment and technology transfer to the developing countries? Each of these possibilities have ruinous ramifications to the developing world. But there are other risks too. The disintegration of the second world would render a major set back to the third world in the latter's struggle against imperialism and colonialism. It is important to realise that it was this second world with Soviet Union as its centrepiece which had helped the third world through moral and logistical support to withstand the Western pressures mounted upon them on issues such as tariffs, terms of trade, technology transfer, international debt burden, etc. Now, with the withdrawal of this

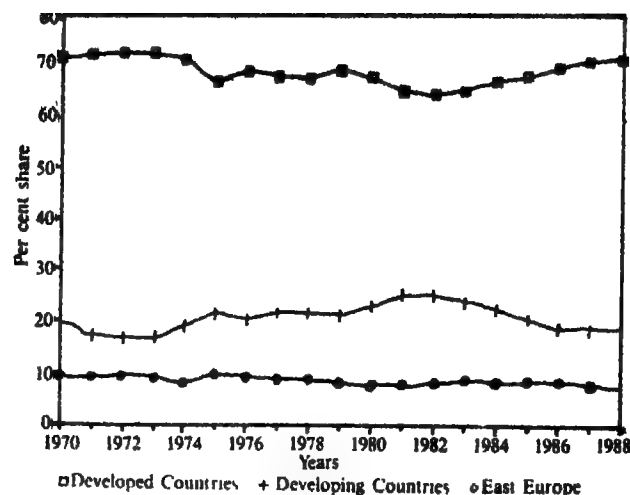

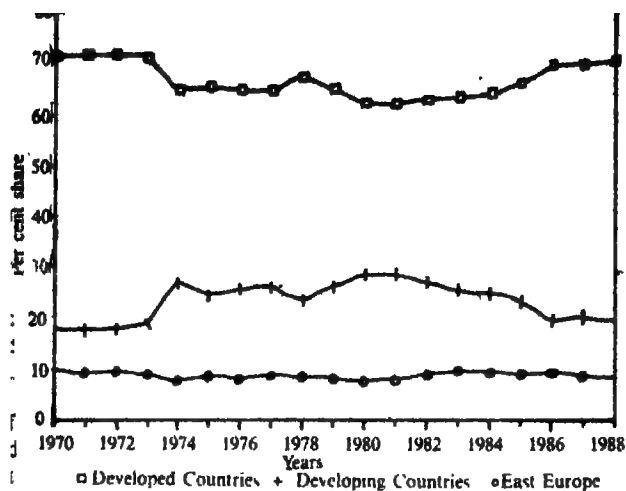

essential prop, the third world countries are caught in a weak spot. Other things remaining the same, they can expect a stiffening of the West's attitude on trade and investment related issues. In short, the East European episodes would, it is widely perceived, maul the life of the developing countries: messier and more intricate than ever before; and if not handled properly and with intelligent foresight and some imagination, these forces would set out to disorganise all walks of their economic and social life.

Although there are such clear indications in practice very little is known on what impact it will have on the industrialisation and trade prospects of developing countries. For until now, these discussions are in general always in the abstract. To gain some insight into this, we provide in this article some discussion and economic analysis. But we hasten to add that the task of going into

the dimensions of the problem at equal depths could not be performed in this paper. What we have done is to present some data which bear upon the magnitude and direction of effects to developing countries from the standpoint of their global trade in the light of structural changes in East Europe. Need our focus on trade might have led to ignore some other very important effects, but even a modest attempt in this direction may, we believe, be of some use.

The following empirical procedure is used to determine the precise dimensions of this trade threat. First, our concern is to seek what evidence we have, if any, to suggest that these countries will challenge the developing countries out of their present market, while competing for markets abroad. Working towards this end, we go behind the trade records of three major country groupings—capitalist East, the developing South and the developed North—over the period 1980 to 1988; and observe the changes in the structure of trade of the former vis-à-vis the changes in the latter two respectively. The end of the eighties is significant because

just prior to the pensioning of communism, almost similar forces have been at work across the Eastern block. In the next step, taking the 1980-88 experience as *prima facie* evidence, we try to speculate on the magnitude and the dimension of the problem to developing countries, when the East's transition to a capitalist economy is completed in the years to come. Something is known, for instance, about the East's trade, that until very recently a large part of their trade moved within their own neighbourhood. It is obvious that with the disintegration of this group, much of this intra-East trade will get diverted to markets abroad. If the structure of their intra-East exports is found to be very identical with the structure of the developing countries' exports then we can expect both East and the developing countries coming into friction in international trade. A usual way to verify the proposition is to use a measure of export similarities. At an analytical level, this measure aids to identify whether the export structures of two countries or groups of countries are mutually competitive or

complementary.

When the inputs from this statistical investigation are put together, the natural conclusion is that the East's entry into the global economic zoo has harmful ramifications for developing countries in terms of opportunities to trade. There are two circumstances which reinforce this conclusion: The first circumstance is the findings of the 1980s which show a firm trend of trade diversion that has already begun to flush out South not only in the markets of North, but also in the markets of its own region. The second circumstance is the apparent tendency for the structure of intra-East Europe trade to be very similar to the export structures of the South. Four product groups—mineral fuels, textiles, manufactured goods and machinery and transport equipment—account for 60 per cent of the intra-East trade. Needless to say, the South's exports are also concentrated in these four product groups.

The organisation of the paper is as follows: In Section II, we begin by taking stock of the march of events. What propelled

the counter reformation in East Europe? Where do they stand in their resurrection business? What is the West doing towards its Eastern neighbours? Such broad questions can, no doubt be treated only briefly and incompletely but at least it may help to organise our discussion. In Section III, we put into relief some of the stylised facts relating to how these changes in the East European polity would affect the trade opportunities of the developing countries? Will they ripple through their trade in the years to come? Should they be pessimistic about their trade prospects? Finally in the last section we make our concluding observations.

II

March of Events

What propelled the counter reformation? It is no secret that the past few years have been a period of increasing puzzlement and disillusion for the people of East Europe. Economic stagnation had engulfed the whole region and the living standards had taken a nosedive.¹

Czechoslovakia after doing rather well in income per head by comparison with both France and Austria in the 1950s, is believed to have fallen in the 1960s, and further down in the 70s and 80s. Similarly, the gap between East Germany's income per head and that of West Germany seems to have been more or less constant till 1970, but since then the gap has continued to widen. Both Romania and Bulgaria when compared with Spain and Greece—the two relatively poor capitalist countries—turn out to have lost ground for the latter. By the beginning of 80s, Poland had also been exhibiting strains in the economic system which were structural in nature.² The obvious fact appears to be that the centrally planned economies of the East did tolerably well in the first decade of the communist rule—probably when they were shifting the surplus labour from land to a few easily organisable industries but since then, economic progress in the region has been less than spectacular, especially when the test came to improve labour productivity, absorb new techniques, make a wider range of products, and even make them better. The investment rate had

been sluggish.³ The great borrowing of money from the West was an attempt to arrest the continuing deceleration. But it failed and sank into a morass of debts and deficits. With a mounting debt burden, which cost countries like Poland and Hungary nearly 50 per cent of their hard currency earnings,⁴ deterioration in their terms of trade with the Soviet Union, and the inability to obtain imports from the West due to constraints in expanding exports, everything appeared to be on the brink of disaster—that they are in a deep structural crisis. There have been other problems too. For instance, fulfilment of targets in the farm sector tended to lag behind in most centrally planned economies, thus causing serious difficulties in the supply of essential items like food. Again, introduction of advanced technology in consumer goods industry was purposely held back, probably because the planners stuck rigidly to the social welfare function introduced in the immediate post-war years. But with changing incomes and changing social compositions, the texture of needs too tended to change in the centrally planned economies; and in

discontent and resentment started breeding.

The immense psychological impact of this growing discontent cannot be underrated. It led to a feeling that their position was hopeless; that they had been beaten not only by their Western neighbours, but also by the new economic miracle-makers like South Korea and Taiwan; and to catch up with them, there should be a crossing over to the efficiency of free-market. This tide of dissatisfaction—euphoria over gaining the freedom of choice—became widespread especially after the Gorbachev revolution. The unprecedented 'flare up' in the winter of 1989—country after country presenting a picture of carnival shading off into near chaos—culminated finally in the overthrow of the communist rule, and the beginning of a new journey towards restoration of political and economic democracy.

While 1989 has been a year of miracles, the forthcoming years are likely to be less brilliant, more difficult and confused. There are a host of problems to be solved. Prices are distorted, inflation rates are very high, and no less a challenge is the process of reversing from totalitarianism to a capitalist democracy. A thorny question here is: should a reforming communist country concentrate first on political or economic reform? Most people seem to believe that economic pluralism inevitably leads to political pluralism—people free to choose how to run factories and farms, will insist on choosing their governments too.

Here is an account of where the main countries stand in their efforts to transform an atrophied command economy into a demand economy.

Reviving private sector: Poland has been doing the best here. Already there is a law in her statute book promising equal treatment to private companies along with state enterprises; and in principle can employ as many people as they like. Hungary too has enacted a similar law permitting private enterprises.⁶ Czechoslovakia allows only family business. In Soviet Russia a law was passed in 1988 permitting the establishment of co-operatives outside the agricultural sector, and about 20,000 manufacturing enterprises were transferred to a system of self-financing. The intention is that the enterprises should not only make profits, but also finance their own investment.

Opening up public sector: For economic survival, it has been felt essential in nearly all these countries to break up the huge inefficient public sector industries into smaller units. Poland, for instance, has created several hundred enterprises out of a relative handful of old conglomerates. Hungary has been following the same course, but at a slower pace. Czechoslovakia is still cautious.

Price reform: No real competition is possible between companies—private or public—until most of the prices of what they buy and sell are set by the market. Here the prospects are seen to be better. In Poland,

try's prices should be free by 1993. The Hungarians claim that they have liberated nine-tenths of their producer prices. The Czechs say that they will move from the present 10 per cent of their free prices to 80-85 per cent by 1993. Yugoslavia has already something close to a free market system. In Soviet Russia, about 60 per cent of the wholesale trade is to be freed over the next few years.

Money market: While they wrestle with prices, subsidies and inflation, the reforms have to create a more flexible banking system, which lends money to firms. Both the Hungarians and Poles have already broken up their old banking system. In law, their central banks are now confined to a central bank's proper job; and the lending functions have been transferred to several commercial banks that can compete with each other, and even decide for themselves what interest rates to charge on the money they lend. Both Yugoslavia and Czechoslovakia plan to introduce a similar reform late this year.

Western investment and technology: One possible stimulus to the growth of East European economies is to bring in Western help. But vast flows of credit from the West, like that of the 1970s, are unlikely to work. Nearly all of these countries would like to promote joint ventures. The Hungarians have so far been the most energetic on this. The Western partners can now buy up to 100 per cent of a Hungarian company, send the money home, and get some handsome tax break. Similarly, there have been moves towards acquiring Western technology with a view to restructuring production and make it internationally competitive.

Foreign trade: Efforts are on to end the state monopoly of foreign trade. Enterprises may now negotiate directly with foreign suppliers and customers. The disintegration of COMECON—the Soviet common market—is also on the way. In its recent meeting, the group has decided to move to a market based trading system.

These six things are the skeleton on which

usually grow. They, of course, do not include other normal issues of economic management, above all inflation. In all these countries the system has allowed an extraordinary amount of inflationary pressure to build up; but it will have to be brought under control by the methods so painfully familiar elsewhere.

The current state of reforms may, therefore, be described as a kind of 'half way

house' in which there has been a departure from some of the dominant institutions, motivations, and behaviour of traditional socialist model; but this departure is yet to successfully fructify by yielding to a full-fledged market economy.

Western society continues to re-enact the philosophical history of ancient Greece. Swept under the alluring carpet of liberal reforms, East-West relations have already thickened. The West's spokesmen have called for an elaborate strategy to help the economic recovery of the East.

A powerful actor in mending the East-West divide is the European Economic Community. The Community, already in the process of welding itself into a single market of some 320 million people, wants to embrace as many as possible of the 140 million people of the East, partly to increase its own power in the region and partly in the hope that a united Europe would have major political significance. Stalking across this wild imagination, the Community is in a hurry to help the East's resurrection business;⁷ and is seen to think in terms of giving better access to East's products in the West's markets, making it easier for Western firms

to invest in the East, encouraging joint ventures, collaborating in scientific research, and helping to train East's managers in the West to run factories. Already, it has promised in its trade treaties, with Hungary and Poland, to end all quotas on manufactured imports into the Community by 1995. Also there is evidence that the Community would reward East Europeans who are trying to be more capitalists and democrats with more attractive treaties than with their retrograde neighbours. For instance, in the agreement with Poland, the Community has broken further ground by lowering customs duties on Polish farm exports. Promises of more attractive agreements with Hungary and Romania are also there. In short, the Community offers to extend trade pacts to East Europe with alacrity.⁸

Suppose things go as well in the next three or four years. Both Poland and Hungary, already ahead in reforms, move over to capitalist democracy more or less smoothly. Czechoslovakia and Romania follow them. Yugoslavia is already close to a market economy. Bulgaria does whatever Russia does; and the latter might have loosened its grip over 70 per cent of the economy. Albania remains a blur in the corner of

everybody's eye. By 1993, even on fairly cautious estimates, the destabilisation in Europe will be considerable—the old order of post-1945 stability will have been broken at the heart of the region.

For the sake of argument, one can also perceive that political consideration will be uppermost in the West's attitude towards the East, i.e. West's Eastern neighbours could get more favourable treatment than producers elsewhere. It seems then most likely that the European Community will grant Generalised System of Preferences (GSP) to a wide variety of East European goods in order to soften the impact of the Community's common external tariff as well as abolishing quantitative restrictions on imports. This could mean significant access for East European products ranging from agricultural products to textiles, and manufactures in the markets of the West's. On similar grounds, one can expect European Free Trade Area (EFTA) to provide wider access to the East's products. Given this endless web of temptation, one can expect the COMECON—the post-war economic co-operation among the socialist countries—to disintegrate, and the countries on an individual basis to divert their trade.⁹

III

Ramifications for Developing Countries

A convenient starting point is to look at how big East's trade is in the global context and how that compares with the positions of the developing and the developed countries respectively. To provide this perspective, an effort has been made to place the distributive shares of the three groups—the centrally planned economies of the East, the developing countries of the South, and the developed market economies of the North—in the world totals of exports and imports. This is shown in Figures 1 A and 1 B. Two observations can be made from the data contained in the figure. First, the East's trade has not yet reached a sufficient size to have quantitatively sufficient impact upon the North's trade. But, it seems clear for the same reason that its trade can become sufficiently large to destabilise South's trade. Second, for a long time until now, East has remained only on the sideline, while the North and the South have been the main frontliners in the world trade. In fact, the former's share altered very little in the course

of the past 18-year period, and the changes whatsoever have occurred, are seen to have affected the latter two who had varying fortunes.

Is there something qualitatively different about East's trade—say about its trading ties as compared to trade flows of the South and North? Alternatively, does the direction of trade matter? To gauge this, we present in Table 1 the distribution of each region's exports between intra- and inter-regional destinations. The data applies to 1980, 1985 and 1987. Reading across the rows, and down the columns, the table gives an insight into an important aspect of trading ties, namely, the intra-regional trade versus the inter-regional trade. The table discloses, for instance, that a significant proportion of the East's trade is within its own region. The share was 51 per cent in 1980, and climbed up to 58 per cent in 1987. Compensating this gain in intra-trade is the loss in its inter-regional trade, especially in the trade with the North, where the latter's share in the former's exports dropped from 31 to 21 per cent. Contrastingly, the South has very weak trading ties with its own region. Most of its ties are with the North. For instance, in 1987,

the North's share alone in the South's exports was 66 per cent. The South as a whole has also weak trading ties with the East; the former's share in the latter's market was less than 5 per cent.¹⁰ Like the East, the North has again strong trading ties within its own region. Almost 80 per cent of the North's exports in 1987 were within its own region and a major proportion of the balance amount went to South with the East remaining only at the margin.

The years 1980, 1985 and 1987 in the preceding analysis were selected for reasons of statistical convenience, and not to represent any historical watershed. However, if one wants to know whether the reforms following the Gorbachev revolution had any perceived effects upon this trade pattern, it would be intelligible to update this data to a year of latest vintage. To bring this precision in our analysis we updated the data to 1989 and part of 1990 and then drew up the directional effect on trade. What emerges unmistakably is the tendency—an oblique indication—for a relative decline in intra-East trade vis-a-vis inter-regional trade.¹ Beginning from mid-eighties, the intra-East trade is in the process of waning, and the

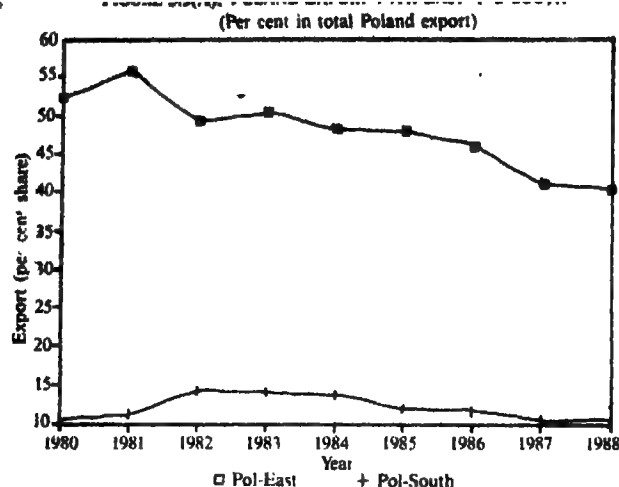

FIGURE 3.6(A). ROMANIA EXPORT WITH EAST AND SOUTH
(Per cent in total Poland export)

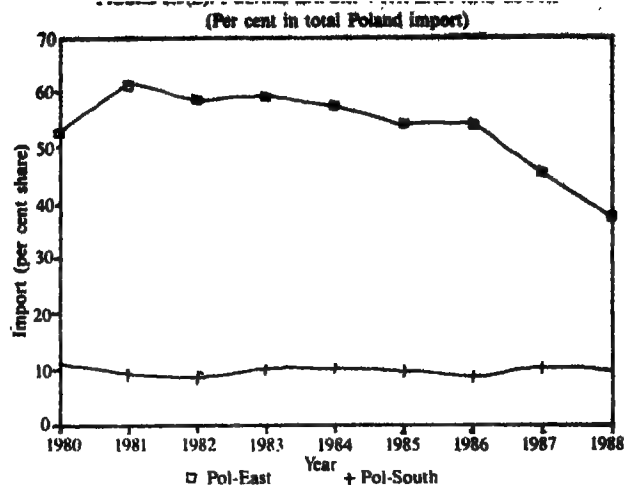

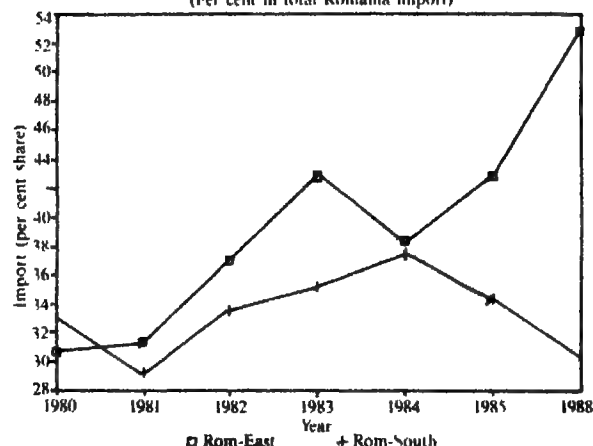

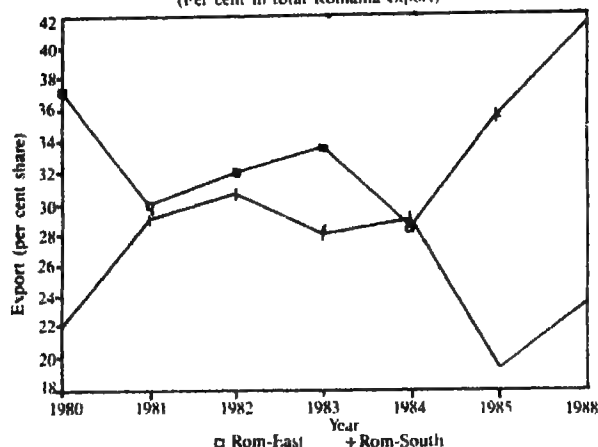

FIGURE 3.6(B). ROMANIA IMPORT WITH EAST AND SOUTH
(Per cent in total Romania import)

inter-regional trade is going up. It is also likely that the kind of market shifts implied in these figures are not likely to be reversed; and instead, the current economic restructuring can be expected to further accelerate this process.

While the data presented above pertain to aggregates, they suggest the desirability of a further analysis aimed at identifying both the products and the countries primarily responsible for bringing these changes. More specifically, we ask: which are the commodities presently undergoing (or not undergoing) this redirection? Have all the countries of the East partaken of this change? We take these questions sequentially.

In Table 2 we have displayed the commodity composition of exports originating from each region and flowing to different destinations under ten commodity headings. The table reveals that intra-East trade is mainly concentrated in four commodity groups, viz, machinery and transport equipment, manufactured goods, mineral fuels, and textiles. For machinery and transport equipment, the proportion is as high as 73 per cent. In textiles, more than half of the East's exports are destined to its own region.

Almost the same story can be repeated for the two other items mineral fuels and manufactured goods. The items which frequent in inter-regional trade are non-ferrous metals, iron and steel, chemicals, agricultural raw materials, and food items. All of these items show declining trends in intra-trade and rising trends in inter-regional trade. The two striking cases are those of non-ferrous metals, and iron and steel which show increasing shifts from intra-East trade to inter-regional trade. Now if we try to posit this pattern of the East with the revealed patterns of South, one could make two casual observations:

(a) The East appears to be pushing down the South's trade not only in the markets of the North, but also in the South's own markets. Signs of this happening can be seen from the experiences in commodities like iron and steel, and non-ferrous metals. In the former, the East's export share in the South increased from 13 to 21 per cent between 1980 and 1987, while the South's share in its own market declined from 49 to 34 per cent. In the latter case, the South's share in the North's market declined from 77 to 68 per cent and that of the East climbed from 50 to 66 per cent.

In machinery and transport equipment, and textiles also the East's share in the South increased, while intra-South trade in these products tended to decline.

(b) Any further redirection of the East's trade will certainly be at the cost of disturbing her present intra-trade which is predominated by textile, machinery and transport equipment, mineral fuels and manufactured goods. The continuing influx of these exports from the east is likely to cut the South's opportunities further because these are the items in which the South has gained comparative advantage in recent years.

It is idle to pretend that all the countries of the East have contributed to this change. The countrywise experiences, displayed in Figures 3.1 to 3.7 tell a different story. The experiences of Hungary, Poland, and to some extent Soviet Russia are seen to be quite different from the rest. All the three indicate trends of diversion of trade from intra- to inter-regional destinations after 1986. Hungary, for instance, is seen sending only declining proportion of its exports to other countries of the East after 1986. For Poland, it dates from the early 1980s and for Soviet Russia, it starts from 1986. On the

FIGURE 37(A) USSR EXPORT WITH EAST AND SOUTH
(Per cent in total USSR export)

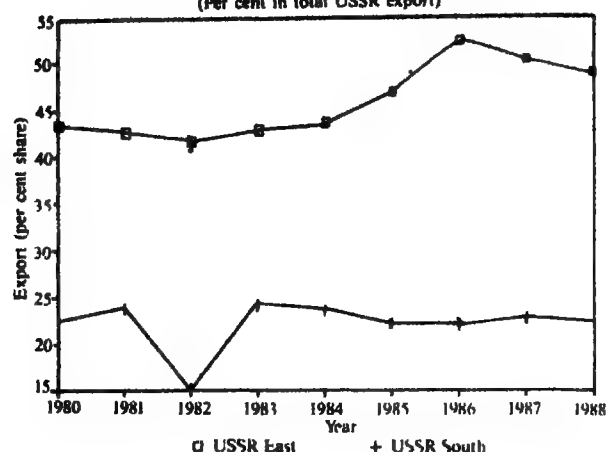

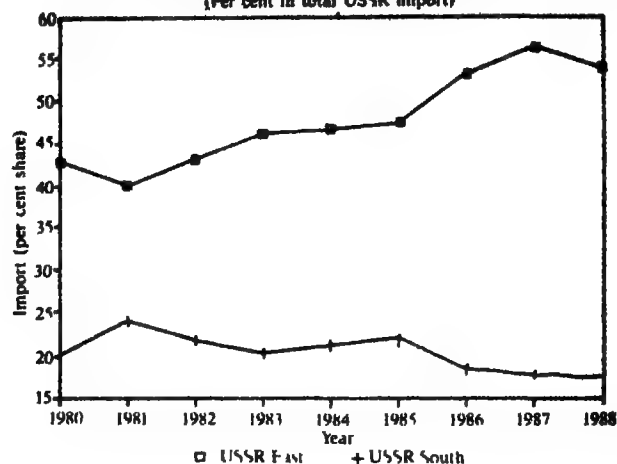

FIGURE 37(B) USSR EXPORT WITH EAST AND SOUTH
(Per cent in total USSR import)

Data source UN, *Monthly Bulletin of Statistics*, various issues

other hand, Romania, East Germany, Bulgaria and Czechoslovakia have been sending an increasing proportion of their exports to the region. East Germany sells 80 per cent of her exports to other countries of the East. For Bulgaria and Czechoslovakia, this proportion is again as high as 75 to 80 per cent.

The countrywise picture educates us in another way—it sheds light on the intensity of each country's trade with the South. The general picture emerging from the figures is an overall decline in their trade with the South. There are, of course, some notable differences. Poland, for instance, has been receiving a steady flow of imports from the South. One can recite almost the same story for Soviet Russia. East Germany provides a different experience—the South's share in both exports and imports has remained steady without any major change.

Before concluding this general review of the structure and pattern of East's trade, two further points will be briefly touched upon. The first is about the historical trends in the foreign trade—exports and imports. This is illustrated in Table 3 which gives the annual growth rate in the value of their aggregate exports and imports for individual countries of the East as well as for all the three regions separately. What can be seen is the relative slow-down in the 1980s as compared to the 1970s, in all the countries of the East trade accelerated during the seventies and slowed down in the eighties.

The second point concerns the distribution of East-South trade across different geographical regions of the South—Africa, Latin America, Asia and Europe. Table 4 gives these details. The gross impression conveyed by the table is that the Asian region constitutes the single-largest market for the East in the South, if one ignores Cuba.

To sum up, the analysis tends to confirm much of what has already been suspected. There is a structural shift in the pattern of the East's trade, at least from the beginning of the mid-eighties. A decreasing share of

its goods are now being exchanged within the region, while an increasing share is shipped to markets abroad. This redirection of trade has already begun to flush out the South not only in the markets of the North but also in the markets of its own region.

FUTURE PERSPECTIVE

Taking this as *prima facie* evidence, we can also predict that with the present transformation in the East, this shift can presumably be expected to gather further momentum. The developments in the next few months would indicate when this phase would arrive finally. But then one can witness the curious spectacle of the East groping for markets abroad. This brings us to the last and final phase of our enquiry—how would the East's integration with the world economy shape the South's trade in the years to come? The facts suggest that in such an event, a substantial proportion of the South's exports would face difficult adjustment problems. We have two clues which tend to reinforce this conclusion.

The first relates to the kind of products which will be diverted from the East's markets to markets abroad. There are already some clear expectations on this. The intra-East trade is concentrated in four product groups: mineral fuels, textiles, manufactured goods, and machinery and transport equipment. With the disintegration of this group, it is obvious that these will be product groups which will be shipped to the world market. Needless to say, the developing countries' exports are also concentrated in these four groups.

The second clue to our problem is one of a more systematic way of finding out the similarities between the structure of intra-East export and the export structure of developing countries. Table 5 contains our results of these similarities/dissimilarities where we have tested homogeneity of distributions¹² between exports of alternative pairs of groups: intra east vis a vis the

South, intra East vis a vis the North, etc. Though the statistical test of significance does not clearly confirm our hunch, there is some definite evidence of export matching between intra-East and the South. Contrastingly, the evidence in the intra-East-North comparison yields increasing dissimilarity.

A highlight of the result is that for both 1980 and 1986, export flows from the East to the South were as similar as the flow within the East. On the other hand, intra-

TABLE 5. COMPETITIVENESS BETWEEN INTRA-EAST TRADE AND TRADE FLOWS IN ALTERNATIVE DIRECTION
(Chi square results for test of homogeneity of two distributions)

| Intra-East Trade Vs | Calculated Value of Chi Square | |
|---------------------|--------------------------------|-------|
| | 1980 | 1986 |
| 1 South World | 348.9 | 71.0 |
| 2 North World | 37.7 | 120.1 |
| 3 East North | 178.2 | 143.9 |
| 4 East E/C | 276.6 | 153.0 |
| 5 East South | 14.7 | 15.3 |
| 6 North South | 126.5 | 285.3 |
| 7 South South | 162.1 | 63.67 |
| 8 South North | 508.2 | 80.5 |
| 9 North North | 27.2 | 103.7 |

Notes: (1) Chi square statistic is computed by using data on 10 categories of exports (1/2 digit SITC level). In case the calculated value of Chi square is less than tabled value, the hypothesis that 'there is no difference in the distributions of exports of intra-East and other regional groups' is accepted. It should be noted that the results are only suggestive. For details about the test see Yule, G. and M. G. Kendall, *An Introduction to the Theory of Statistics* (Griffin, London, 1977).

(2) Tabulated value of Chi-square (9 d.f.) for 1 per cent level of significance is 21.7.

East-North or East-EEC. The corollary of this could be that Eastern Europe may try to increase its exports to the South if its intra-trade finds outside markets. Supposing the South becomes the target-market for the East, it is the South-South trade which will be adversely affected, and not the flows from the North to the South. The Chi-square estimates presented in the table bring out that the export structures of intra-East flows and intra-South flows tended to become more competitive over the years, while that of intra-East and North-South grew more dissimilar. It then appears that South-South trade is going to face more hurdles in the coming years than before.

The South, however, cannot become a sole market for the East because the latter would have to depend on the North as well for technology and hard currency earnings. In that case again, the South would have to compete with the East in the Northern market. The export structure of intra-East flows turned out to be more competitive over a few years to the export flows from the South to the North, while intra-North trade flows and intra-East flows tended to grow more dissimilar.

Going by these tentative estimates, the tendencies are thus towards more of a competition between Eastern Europe and the South, rather than between the East and North. The South may stand to lose both its own market and in the markets of the North.

IV

Conclusion

Countries of the poor and developing South have been hoping against hope that the 1990s would not turn out, like that of the 1980s, to be a lost decade. But viewed against the backdrop of changes in the political environment in the past couple of months, they can no longer afford to draw comfort. Teetering already they can expect to encounter further problems in expanding their trade. In their own region, the continuing influx of exports from the East block pose a threat. They will encounter problems in penetrating the preferred markets of Europe after the integration there. Across the Atlantic, the supposedly greatest champion of free trade is using its muscles to doze the poor developing countries of Africa and Latin America in the international trading arena. On top of this, it is embarking on a free trade agreement with Canada which will one day be another dress. And, in a tussle between the two presses, the developing world will be caught to its knees as a supplicant for petty favours.

Notes

The authors thank Pranab Bardhan for a useful discussion on the subject. An earlier version of the paper was presented at a workshop

Sociology in India

A View from Within

Meenakshi Thapan

Informed largely by the work of the French sociologist, Pierre Bourdieu, this article attempts to identify and analyse the 'field' of sociology in India. It traces the development of sociology as a discipline and then its institutionalisation in the Indian context. Against this background are set out some of the various divisions, struggles, and relationships that constitute the field of sociology.

In order to identify and analyse the field of sociology in India, it is first necessary to define both my use of the term field in a specific sense and of sociology as it has been conceived and practised in India.¹ But first, let me state that my interest in this subject grew out of a wider concern with field work, both as it is conducted and written about.² As sociologists or anthropologists we do field work on 'the other', an entity, being, or situation somewhat separate from ourselves as professional sociologists. My interest lies in turning the sociological gaze inwards, or more appropriately, on ourselves as practitioners of a particular discipline in which we have been trained. The question arises as to whether it is in fact possible to turn this gaze, so used to looking outside at the other, inwards to look at ourselves? Can we apply the same norms and principles of method to look at ourselves as we do, so critically and analytically, with 'the other'?³ This sociological self of course also includes the author who is in fact attempting to turn the sociological gaze not only upon 'other' practitioners of the discipline but also on herself as a member of the community of sociologists. This is by no means an easy task for it may yet be simple to examine sociologists as 'the other' but far more difficult to understand sociologists and sociology in India with oneself as an integral part of both the object of study as well as in the role of the observer. Bourdieu of course, argues that for the development of a 'genuine social science' what is required is *participant objectivation* in which the researcher "reflexively situates his or her own position in relation to the study" [1989a]. This is considered an essential prerequisite for a truly reflexive sociology.

The 'discipline' of sociology in India is one aspect of my analysis, i.e., an attempt will be made to briefly examine the historical development of the discipline as well as its substantive content. I would however like to distinguish sociology as a 'discipline' from sociology as a 'field'.⁴ This necessitates an explanation of the term field as it is being used in this paper. "Field", as Bourdieu uses it, in particular, the "intellectual field" (since this is our concern) is "like a magnetic field, made up of a system of power lines. In other words, the constituting agents or system of agents may be described as so many forces which by their existence, opposition or combination, determine its specific structure at a given moment in time" [Bourdieu 1969:39]. Later, however, Bourdieu conceded that it was necessary to go beyond this particular

construction which viewed the intellectual field "as a relatively autonomous universe of specific relations" [Bourdieu nd:77]. The field in fact does exist in relation to other fields in social space, most notably to that of power (i.e., economic and political power). In other words, relations within it are constituted by relations within the field of power.

Next an important consideration is the place of sociology as a discipline within the intellectual field viz., its relation to other social sciences or to the 'pure' or natural sciences. It is quite clear that sociology in India does not have an autonomous existence and is closely linked to religion, or economics and politics for example, that influence both its substantive content and method. It is thus important to locate sociology in its intellectual moorings in relation to other disciplines in order to establish the influences that prevail both on the discipline and on the field. The most important concern nonetheless, remains the field itself: the relations that obtain in it, the positions occupied in it by institutions, agents, participants or the practitioners of the field, the struggles for positions and for the reproduction or transformation of the capital which is specific to the field.⁵ The possession of this capital, in varying degrees or forms in fact endows with power the participants depending on their position in the field. The 'habitus' of the practitioners, i.e., the system of dispositions they have acquired by internalising a determinate type of social and economic condition and which find in a definite trajectory within the field under consideration a more or less favourable opportunity to become actualised" [Bourdieu 1989b:32] and the more specific trajectories indicate to us the essential character of the field that is reflected or manifested in the social space of the relations, struggles, varied positions and 'position takings' in the field.⁶

There are then several concerns or many strands of concern that are reflected in this paper to define sociology as a discipline and as a field to trace the development of the discipline and the broad rubric of its content and method and to undertake an analysis of the field itself in terms of the practitioners of the discipline who both constitute and reproduce or transform the field.⁷

SOCIOLOGY AS A DISCIPLINE

In order to understand sociology as a discipline in India, we first need to clarify

whether we are referring to sociology or social anthropology as both have been used almost synonymously in India. Beteille [1974] suggests that there is in fact no clarity in the conception or in the usage of sociology and social anthropology in India.⁸ It is therefore not possible to formulate neat definitions and following Beteille, I would argue that both disciplines "have the same approach to the study of social life, that their methods are similar, but that they have developed different techniques of investigation and analysis" [Beteille 1974:9]. He suggests that the most common difference in techniques is probably that between intensive fieldwork and survey investigation. An analysis of what constitutes sociological and social anthropological research in India does not, however, suggest great discrepancies, either in terms of interest or in terms of approach, as we will be obvious when we discuss the content of sociology as a discipline. I therefore, find it difficult to accept Guha's rather simplistic assertion regarding the separate concerns of sociology and social anthropology, the former reflecting an interest in 'macro', the latter in 'micro' processes, or in conflict and social order respectively. Even more superficial is his illustration of these differences with reference to two works by Srinivas without explaining the basis or the method, by which he does so [see Ramachandra Guha 1989:344-345].

Both sociology and social anthropology were established in India as a result of the colonial encounter with Britain. This affected the manner in which the disciplines were institutionalised with separate departments being established for both and the manner in which research was sought to be conducted and the disciplines taught. More significantly it points to the extent of the influence of the political field on the intellectual field in India.

It was as a colony of the British in the nineteenth and twentieth centuries that we can trace the beginnings of an interest in sociology as a discipline and its institutionalisation in India. The manner in which the discipline took root in the colonial context is reflected in two events: an increase in a kind of social and cultural activity or sociological reflection, as it were, that could be considered intellectual activity of a sort and the institutionalisation of the discipline in different universities across India. Of course this process was accelerated in the period after 1947.⁹

From all accounts, it would appear that

general sense was established in Bengal in the eighteenth and nineteenth centuries. The political field of colonial bureaucracy influenced the development of the intellectual field in two ways. On the one hand it influenced the establishment of certain social and cultural societies for the benefit of intellectual activity. For example, in Calcutta, Sir William Jones founded the Asiatic Society of Bengal in 1784. History, science and art were the major themes of interest. In 1828, the Academic Association was started by Henry Derozio in Calcutta with several active Indian members and functioned mainly as a debating club. Another short lived club but with wide ranging interests was established in 1838 again in Calcutta. The interests and activities of this club—the Society for the Acquisition of General Knowledge—covered history, geography, language, and social conditions. In 1839, the *Tatwa Bodhini Sabha* started in Calcutta to discuss social conditions and problems and also to question certain established customs and institutions. While the British certainly aided in the establishment of several of these societies in Calcutta, the efforts of some Indians at the time need to be specified. The most notable of these was Raja Rammohun Roy (1777-1833), social reformer and founder of the Brahmo Samaj. In fact Dube has suggested that Rammohun Roy's views on religion, caste, position of women, etc., were to characterise much of Indian sociology later on [see Dube 1977 for more details]. Similarly, other active societies and institutions were established in other cities in India.¹⁰

Dube has chronicled the development of sociology through some of these institutions. For example, the Oudh Scientific Society of Lucknow which was concerned with 'social problems' had a paper on the 'sociology of India' presented before it by one Syed Shurafuddin Mohtashim, specifically, in 1869, the Society for Sociological Studies was established in Jaipur. The most important institution concerned with social science was the Bengal Social Science Association (1867-1876) which was dedicated "to the promotion of social science in the Presidency of Bengal" [Dube 1977: 7]. Papers presented before this association reflected a 'deep social concern' and were essentially concerned with reforming and 'energising' India [Dube 1977: 7].

On the other hand, the colonial bureaucracy contributed inadvertently to the further development of sociology through its requirements for purposes of administration. That is, British officials realised the importance of an adequate knowledge of Indian culture and social life to an efficient functioning of India. In 1769, Henry Verelst, the governor of Bengal and Bihar realised the need for collecting information on the "leading families and their customs" and issued directives to his officials [Srinivas and Panini 1973: 181]. Subsequently, many British officials and also missionaries undertook this task (for example, Abbe Dubois,

Hindu Manners and Customs was published in 1816). In 1871, the first all-India census was undertaken by the British government which has subsequently become an important source of information for social and cultural analysis. Srinivas and Panini however also suggest that the census also became an 'instrument of social policy' [Srinivas and Panini 1973: 181]. For example, distinguishing between different castes resulted in a certain 'self awareness' and competition to claim higher caste positions. The practice of recording data on the basis of caste was discontinued except for certain categories in 1951 [Srinivas and Panini 1973: 181]. In 1901 the Ethnographic Survey of India was established and collected a mass of crude social data. It has however been suggested that neither of the two agencies for various reasons, were the 'perfect agencies' for the collection of data [Dube 1977: 7].

Clearly then, while the British did succeed in launching, as it were, an interest in the collection and analysis of data, of whatever kind, it was not without a suggestion of their own position as the rulers gathering information on the 'natives' perhaps in order to categorise them better for purposes of administration but in effect of rule. The field of power is thus very closely linked to the creation and establishment of the contemporary intellectual field in India. This is also evident in the overall education system that colonial bureaucracy sought to impose on India.¹¹

INSTITUTIONALISATION OF THE DISCIPLINE

The next important question is when does sociology then become sociology as a discipline? This may be analysed by tracing the growth of institutions for the teaching of sociology and social anthropology in India, the establishment of professional journals, as well as through contributions to the discipline over a period of time.¹²

It is clear that the first university department of sociology was started at Bombay (as the School of Economics and Sociology) in 1919 but prior to that, sociology was being offered as a course or part of a course in different departments in the country. The first known university to start teaching sociology as part of a course was Mysore University in 1917/18 soon after the assumption of headship by A. R. Wadia [Parvatham 1972: 61]. In 1917, sociology was introduced in the Post Graduate Council of Arts and Sciences and in 1921, a department of anthropology was established at Calcutta University. In 1919, as already stated, Bombay University started what is considered the first department of sociology with Patrick Geddes as the first occupant of the chair of sociology. In 1921, a combined department of economics and sociology was started under the headship of Radhakamal Mukherjee at Lucknow. He was joined in 1922 by D. F. Mukherjee and in 1928 by D. N. Majumdar. Clearly, the close

links with other disciplines—biology, economics, are self-evident in the early institutionalisation of sociology in India.¹³ Moreover, the agents, or practitioners, responsible for the different institutions belonged to other disciplines and had varying interests, not limited to sociology alone. Thus, Wadia was essentially a philosopher, Geddes a biologist, human geographer and town-planner, R. K. Mukherjee was an economist with an interest in ecology and social work, and so on. These varied interests, one would have thought, would surely have contributed to the growth of sociology in many different directions. While this may have been so in the beginning, in the work of particular sociologists, we find that in later years, sociology in India was channelled into three or four major avenues which were not without a form of social hierarchy in terms of the kind of status that came to be associated with each of them.

Sociology in India has thus been characterised by different approaches and methods—all of which reflect underlying theoretical and ideological convictions. There is also the important influence of western interest in India as an object of study. This suggests the interplay of different fields and proves beyond doubt that in terms of content at least sociology does not constitute an autonomous field in India. The content of sociology in India is thus not specifically limited to a particular area or discipline nor to a single approach.

If we view sociology and social anthropology coterminously, then the Indological approach has dominated sociological study in India especially in the early development of the discipline evident, for example, in the works of G. S. Ghurye and J. Karve. It is important to point out, however, that both tradition and problems of modernity interested Ghurye unlike Karve who was a more strict adherent of the Indological method. D. P. Mukherjee is another exception who maintained an interest in the study of tradition and yet, perhaps due to his Marxist leanings, concerned himself with problems of social change.

The Indological method was later developed by Dumont and Pocock in their programmatic statement when they launched the journal *Contributions to Indian Sociology* (CIS) in 1957. Such an approach, exemplified in the works of Ghurye and Karve, and later in that of Dumont and also in the pages of CIS, essentially reflects a concern with Indian tradition. This approach is linked to the past and is therefore supportive of a world view that examines India as it was rather than as it is today. It is also an approach that has many takers in the west evident in the number of articles published in CIS by western scholars culminating in a recent issue on 'An Ethnosociology of India' which recommends a specifically Indian (read Hindu) sociological way of looking at culture [see CIS 1989, Vol. 23, No. 1]. India, the esoteric, exotic and even erotic has not ceased to be a marketable

commodity in the west. It has, therefore, remained an attractive and popular object of study for Indian scholars and Indianists abroad who subscribe to a particular approach. This approach, however, can also unwittingly lead to the glorification of the Indian (mainly Hindu) tradition to the neglect of other traditions as well as of contemporary sociological problems for research.¹⁴

Scholars such as R K Mukherjee used a more inter-disciplinary approach for the study of Indian society and especially advocated the use of economics and ecology in understanding different aspects of the social reality. Such an approach is an outcome of Mukherjee's concern for the underprivileged reflected in his pursuit of social work among the underprivileged sections of society in Calcutta and elsewhere.¹⁵ The interventionist role of the sociologist was recommended by D N Majumdar as far back as 1956 [see Madan 1982: 19-20] and such an approach has formed a second stream in the history of Indian sociology.

There have been several studies on different aspects of Indian society related to, for example, the agrarian structure, urbanisation, institutions, industrial relations, education and so on. In terms of publication in professional journals, however, such problems have been largely discussed in *Sociological Bulletin*¹⁶ and the *Economic and Political Weekly* rather than *CIS* which has had a different image by its association with Dumont and his kind of sociology. This is a telling comment on the nature of the field itself, divided as it has been in terms of different orientations and relations emanating from these orientations. Of course, one approach is often considered intellectually superior to another in the order of things and this inevitably affects relations among the practitioners of different approaches as well as the student fraternity.

Another approach, dominated by the early works of M N Srinivas, has been concerned with different aspects of village life and falls under the rubric of 'village studies' in general. Such studies have been influenced largely by the fieldwork tradition (in terms of method) and produced monographs on different aspects of village life (for example, those of Srinivas [1952b]; Beteille [1965]; Madan [1965]; Srinivas [1976]; among others). Village studies have constituted a significant area of research in Indian sociology largely because of the emphasis on field work and on the sociologist studying his own society.

There has nonetheless been an unfortunate tendency towards neglecting contemporary urban and modern India as a domain of inquiry. Thus traditional and village India has remained a more popular and somewhat exalted area of study than modern India, encouraged and abetted by a particular worldview of Indian society. This is also true of particular institutions (university departments of sociology) which emphasise certain approaches and areas of interest.¹⁷

Finally, there has been the work of Indian

scholars on other cultures, societies and thinkers. Although such work has been rare (for example, Uberoi [1984], among others), it has not succeeded in generating any particular interest in the discipline as a whole. One reason for this is that some professional journals in India, such as *CIS*, do not lend themselves to the publication of such work. This makes the plea for the indigenisation of the social sciences [see, for example, Madan 1966, 1979] a hollow one. Is indigenisation to be viewed only as work in the field of India as the object of study from Indian perspectives or points of view? Does this further imply that the work of Indian scholars on other cultures or their participation in theoretical debates taking place in other cultures is not to be viewed as making a significant contribution to Indian sociology? Another moot question is why is it that such work has not received favourable attention in the field of sociology in India. A major reason is that western interest in India as an object of study has resulted in its great popularity among Indian scholars. Another reason is the view that the study of one's own society is a somewhat easier proposition than that of another culture in terms of not having to learn a foreign language, familiarity with one's own culture, and so on.¹⁸

Western theoretical approaches and methods have nonetheless always had a certain respectability in Indian sociology notwithstanding attempts at indigenisation or intellectual *swaraj* (by, for example, Uberoi [1968], Uberoi [1974]). Of late, recent trends in structuralism, post-structuralism, the sociology of science, medical sociology, feminist work, and other innovative theoretical paradigms that have found popularity in the west have increasingly penetrated the research problematic in Indian sociology. This is especially true of particular institutions that have, over time, acquired the reputation of being 'elite' centres of Indian sociology. The interest in western paradigms is however a result of a greater awareness of recent developments in western thought and of a view that gives priority to the inclusion and use of such approaches and methods over developing indigenous ones. Moreover, an interest in such work bestows the sociologist with capital symbolic of a certain status emanating from the west but located in what s/he considers an increasingly modern, intellectually developed and 'aware' Indian sociology. It also lays greater emphasis on the development and refinement of ideas as opposed to the analysis of material emerging from fieldwork. This can result, in the foreseeable future, in the possible death of the fieldwork tradition emphasised by Srinivas and developed and perfected to a fine art by other senior practitioners of the discipline. This is bound to result in a major change in Indian sociology as it has been practised and developed so far.

For all the variety of approaches and methods that constitute Indian sociology, it has nonetheless remained a largely 'soft'

discipline, partaking neither in social change at a practical, societal level nor in contributing in any depth to theoretical developments in the discipline as a whole. If it is anything that Indian sociology is renowned for, it is for the study of Indian tradition popularised largely by the interest of western scholars. Indian sociology has not yet made the kind of contribution to the discipline as a whole as, for example, Indian history has.¹⁹ There is space, therefore, for Indian sociology to come into its own as an autonomous discipline in the intellectual field in India. Until it does so, it remains a limited sociology dominated by, and dependent on, other disciplines and other fields in terms of both its substantive content as well as in its method.

'FIELD' OF SOCIOLOGY

The most significant and unexplored aspect of sociology in India is the 'field' itself—considering the importance of the individual sociologist in establishing and developing particular departments, in attracting students, in contributing to the discipline, in constructing an image of both the discipline and its future potential, in effect, as an effective instrument for the making of sociology in India. Who are these individuals and what are they made of? What positions do they occupy? How do the different forms of capital they thus come to acquire affect the nature of the relations amongst themselves? What constitutes power in the field and how is it bestowed on the individual sociologist or on a particular institution? How does sociology as a discipline in India define relations in the field and contrarily, how do these relations play a role in constructing different kinds of sociologies in India? These are only a few of the important questions to answer which we need rich and detailed material on individual sociologists and their trajectories.²⁰ A more complete understanding of the 'field' of sociology in India can therefore be attempted when we have this material. This paper seeks only to lay the grounds for establishing the presence of the 'field' of sociology in India in the most general terms.

To begin with, the field in India is perhaps currently defined by the most important institutions within the university field where the discipline is practised. These are those that are bestowed with power in terms of the capital,²¹ of the individual sociologists located in them as well as of the research output of the university department concerned and its national and/or international renown. Students at these departments are also assessed and they are viewed either as contributing to or reducing the academic and scientific capital the institution may acquire or already possess. These institutions are the repositories of power in the field of sociology in India and sociologists associated with them contribute both to the trends in sociology as well as to the further accumulation of capital thereby reproducing the already existing capital. This is done through several different avenues. At the

public level, for example, the limits of what is considered thinkable or knowable in sociology is determined by such university departments through the medium of syllabus construction and reconstruction. At another level, sociologists reproduce their 'academic power' through mainly two avenues: their writings and their students. Thus, publishing in a professional journal or with a prestigious publisher in India or abroad leads to the acquisition of a certain capital and intellectual renown. Recent trends indicate that if one publishes in more popular journals such as *The Illustrated Weekly of India* or national dailies, for example, *The Times of India*, one reaches out to a wider audience and thereby acquires greater renown in both academic and non-academic circles.²¹ This is further accentuated if one comments on political affairs, current events, or environmental issues and other currently popular affairs. At the same time, one is reproducing the capital one has acquired through the institution to which one is affiliated. This is evident in one's writings through the opinions expressed or the underlying ideological position, and quite simply, in the status one has acquired by virtue of association with a particular university department or institution.

Reproduction of the sociologist's academic capital through students is a more ingenious affair and probably not very different from what is the practice in other societies. The main point is to involve students in one's current area of interest as well as research. It certainly helps if the sociologist has a good reputation *vis à vis* other students and in the international academic market. The latter is useful, from the student's point of view, for acquiring a coveted place in a university abroad. Apart from gaining students to work in more or less one's own research area, the sociologist also acquires student loyalty, a much prized form of capital, which is not easily available to all sociologists but constitutes a special bond between a particular teacher and student. As Bourdieu puts it most succinctly, the teacher or research supervisor "is the chosen one rather than the chooser, and the value of his pupils, who, although they are not exactly his disciples, nonetheless grant him a form of intellectual recognition, helps to create his value—as he helps to create theirs" [1988: 94]. The student then is the perfect avenue through whom academic capital can be reproduced. Once a student is associated with a particular teacher for purposes of research, the teacher has considerable power over the student's academic life as well as later placement in an appropriate position in the university or an affiliated institution. This is one form of 'academic power' the sociologist exercises especially if s/he holds a university position.²²

Academic power is also exercised by sociologists in relation to one another. This is primarily a result of the social and intellectual status attached to a particular sociological approach or area of research over others. Thus, sociologists who adhere

to a currently popular theoretical and methodological approach are somehow endowed with greater power. This power is really 'symbolic power' of a kind, i.e., symbolic of an intellectually superior way of thinking and analysis. And it is 'misrecognised' as such which gives it the reality and legitimacy it need not necessarily possess in actual fact although it is perceived as doing so.²³ Be that as it may, this power endows the individual with a certain intellectual authority, 'scientific credibility' as Bourdieu would put it, and thereby superiority, in the field. By virtue of this authority, the individual acquires a greater student following and is therefore able to in fact reproduce his or her academic capital at a faster pace.

Relations *vis à vis* colleagues however need not necessarily be as cordial; they may not readily accept or recognise the individual's intellectual position nor the capital associated with it. Intellectual differences apart, there is no doubt that a strong sense of personal competition, that often overshadows intellectual judgement, prevails in the academic field. Thus a particular sociologist's work may be derided on grounds of subscribing to popular approaches or simply of being *avant garde* and not adequately related to the Indian social reality. Another sociologist's work could be condemned for its lack of theoretical sophistication and an undue reliance on material data. Such criticisms, and others of their kind, only reflect the intellectual breadth, rather, lack of it, of the critics and also help explain the nature of the field of sociology in India which is dominated by a lack of understanding and, therefore, appreciation of another view, as if there could be a single sociological gaze rooted in a harmonious space and perfect time.

In the ultimate analysis, the one who is 'successful' is the one who is able to carve out an independent niche and establish his or her somewhat superior position in the field notwithstanding the derogatory or tongue-in-cheek comments of others. Such an individual then 'commands respect' at both the local and international levels.

Apart from academic power, relations in the field are also defined by one's position or lack of it, in the field of 'administrative power' and more importantly, in the closely linked field of 'bureaucratic power' within the political field. Administrative power is associated with membership of various committees or bodies that control, for example, syllabus construction, examinations, faculty appointments, and so on. This power is bestowed on an individual for only a period of three years (at least in Delhi University) when the seniormost professor (by rotation) assumes headship of the department. Of all the areas in which power can be exercised, faculty appointments is probably the most crucial as other department members have some role to play in perhaps every other area except this. It is indeed a rare occasion when a head is truly concerned about the genuine requirements of the department concerned and the merits of the candidates. It is here

then that the exercise of administrative power reflects the true nature of relations in the field. A candidate would usually be selected on the basis of his or her ideological leanings and research interests depending on how closely these tie in with those of the head and the faction of other agents s/he may represent. There is also the tendency for each department to reproduce its collective academic capital by appointing its own students to faculty positions thus ensuring a certain continuity, and thereby stability, in its academic production and reproduction.

There are however certain constraints that accompany administrative power, most notably, a loss in the enhancement of one's academic capital due to the pressure of time occupied by administrative work. Hence, administrative power that goes with a certain position in the field has a somewhat dubious distinction: it is both sought after, by younger agents in the field, and rejected, by older practitioners of the discipline who may have earlier had the privilege of occupying positions entailing administrative power.

Administrative power is also bestowed on the sociologist who is a member or chairperson of a high-powered University Committee or government research organisation such as the Indian Council of Social Science Research. The latter, in particular, empowers the individual to focus national attention on particular research problems over others, determine the allocation of research projects and grants, and through the exercise of such power enhance his or her capital of political power. Such an individual thus possesses not only academic capital and intellectual renown that perhaps was instrumental in bestowing administrative power on him or her, but also a position of prestige in the wider political and bureaucratic arena. This position enables the incumbent to establish relations with persons in positions of political power and thereby use their patronage for the development of the discipline and also for the further enhancement of his or her own capital.

Notwithstanding the benefits, both personal and for the discipline, accruing from such power, the academic and intellectual life of the sociologist survives or thrives, depending on which way one chooses to look at the problem, on academic power combined with 'scientific prestige' and also 'scientific power'. Distinctions and awards like the Asia Society medal or the Ghurye award confer an element of 'scientific prestige' on the recipient as do translations of publications into other national and international languages. Invitations to deliver keynote addresses at international conferences are another indicator of scientific prestige. Similarly, 'scientific power' is linked to the individual's 'academic power' and implies the ability to acquire projects from indigenous sources such as the Indian Council of Social Science Research, and from international bodies such as the Ford Foundation or the International Development Research Council. While such projects may indeed enhance the scientific prestige of the sociologist, this is

not necessarily the view of the academic community at large who may in fact consider this yet another 'racket' and means of acquiring a grant and positions for one's students and cronies.

Clearly, sociologists associated with the 'elite' centres where sociology is practised would be the most likely to hold and exercise these different forms of power. The field of sociology in India then is defined, shaped, and determined largely by these elite centres where in fact most of the academic production and reproduction is taking place. Other centres and sociologists remain more or less outside what is therefore considered 'mainstream' sociology in India. This constitutes the first major division in the field: between the 'elite' and other centres of sociology as well as between the sociologists practising within them. The second division, as we have seen, occurs on the basis of one's ideological position, and more importantly, on the kind of sociology one practises. It follows that this creates a further division in the student community who choose a particular teacher and thereby a research problem, thus identifying themselves with the kind of sociology that is practised by their mentor. Finally, there is a division between those sociologists who are viewed as only possessing academic capital and intellectual renown and are not particularly interested in the trappings of administrative or scientific power and those who revel in the power that accrues from administrative positions and international networks in addition to their already existing academic capital. The latter tend to be viewed as 'racketeers' and 'operators' engaged more in the furtherance of their personal careers and particular projects rather than a devotion to the development of the discipline as a whole. The struggle then is to somehow have an unsullied reputation and yet partake of the fruits of 'racketeering', as it were.

There is no doubt that we can identify and establish the presence of the 'field' of sociology in India characterised as it is by various divisions and struggles for positions. There is scope yet, however, to provide a detailed analysis of the field in terms of the individuals, the institutions, and the manifold relations that constitute the field.

Notes

- 1 There is no doubt that the theoretical perspective on which this paper is based is informed largely by the work of Pierre Bourdieu. I am indebted to him for the many insights he has both explicitly and implicitly provided. However, Bourdieu is in no way responsible for the interpretations and analyses contained in this paper.
- 2 See Thapan [1986] and Thapan [1988a].
- 3 Bourdieu suggests that "the sociologist who chooses to study his own world in its nearest and most familiar aspects should not, as the ethnologist would, domesticate the exotic, but ... exoticise the domestic, through a break with his initial relation of intimacy with modes of life and thought which

remain opaque to him because they are too familiar" [1988: xi].

- 4 There is also the view of sociology as a 'profession'. I do not however find this a particularly useful concept for analysis here.
- 5 I am using the term 'capital' in relation to the 'field' as it is used by Bourdieu: "The forces that are active in the field ... are those which define the specific capital. A capital does not exist and function but in relation to a field: it confers power over the field, over the materialised or embodied instruments of production or reproduction whose distribution constitutes the very structure of the field, and over the regularities and the rules which define the ordinary functioning of the field, and thereby over the profits engendered in this field" [1989b: 30]. For an analysis of the different forms of capital in relation to the intellectual field in France, see Bourdieu [1988: 73-127].
- 6 Position-takings refer to the "structured system of practices and expressions of agents" [Bourdieu 1989b: 32] within the field.
- 7 It is not however possible to cover the ground adequately in a single paper and a larger work on the theme is under preparation.
- 8 Jain has also pointed out that the distinction between the two disciplines "at the level of theory and method is extremely tenuous" [1985: 1]. In an early paper, Srinivas [1952a] recommends the 'union' of social anthropology and sociology under the heading of "comparative sociology" [1952a: 36].
- 9 This is not to deny the existence of a milieu or tradition that facilitated interest in social and cultural problems. Dube [1977] has commented on this aspect by emphasising the existence of various texts that recorded social customs and cultural mores in ancient India.
- 10 Kopf [1969] describes the development of Calcutta in the early nineteenth century as a city where the 'intellectual awakening of the Calcutta intelligentsia' was taking place, a condition necessary for the 'transformation of a traditional society' [see Kopf 1969: 178 ff].
- 11 For a review of Macaulay's imperialist views on the role of a European education in the 'civilisation' of the natives, see Kopf [1969: 236 ff].
- 12 See Srinivas and Panini [1973] for a more exhaustive review of the development of sociology as a discipline in India. See also Saberwal [1983].
- 13 However, among the social sciences, sociology was given a lower rating than other disciplines due to the somewhat amorphous nature of the discipline and its dependence on western, most notably British and later American, conceptions of what constituted the nature and method of sociology. Srinivas and Panini [1973] also make a similar point in their discussion of the development of sociology in India.
- 14 See Thapan [1988b] for a more detailed critique of this approach and its repercussions for Indian sociology.
- 15 See Srinivas and Panini [1973] and Joshi [1986] for more details on Mukherjee's contribution to the development of Indian sociology. I am not discussing any details regarding specific contributions by different sociologists in this paper.
- 16 This journal was started by Ghurye, who also founded its parent-body, the Indian Sociological Society, in 1952.
- 17 This is evident, for example, in the kinds of options that may be offered by a par-

ticular department at the Masters' level and the courses and options available at the M Phil level.

- 18 Beteille has been a notable exception among Indian sociologists who studied a village in Tanjore district in Tamil Nadu and learnt a language (Tamil) other than his native tongue for purposes of conducting field work. See Beteille [1965].
- 19 A major contribution of modern Indian history has been the Subaltern Studies [see Ranajit Guha 1982-87].
- 20 The author is in the process of collecting such data through interviews, biographies, autobiographical material, obituaries and other sources.
- 21 Capital here refers to all forms of capital that influence the field, such as, social origins, educational capital, 'academic' capital, 'scientific prestige' and 'intellectual renown', among other forms.
- 22 'Academic power' here refers to an individual's position on a particular faculty or in a department primarily in terms of seniority. It also implies the possession of a certain 'academic capital', by virtue of which this power is bestowed on him or her, in terms of publications, pedagogic communication, participation in national and international seminars and conferences and so on. Both the spoken and the written word are therefore important in the constitution of an individual's academic capital.
- 23 This is true of not only sociologists but other agents in the intellectual field who are increasingly publishing their views in popular journals, a recent illustration being an individual not only of intellectual renown but also currently holding the highest position in the field of university power, viz, the vice-chancellor of Delhi University, writing in *The Times of India* on some of the theoretical connotations of his position in the university [see Baxi 1990].
- 24 Bourdieu argues that "the exercise of academic power presupposes the aptitude and the propensity ... to exploit the opportunities offered by the field", i.e. the 'capacity' to have students, to help place them and keep them in a position of dependency and thus ensure what Bourdieu refers to as 'the basis of a durable power' [1988:88]. This implies "the art of manipulating other people's career rhythm, their curriculum vitae, to accelerate or defer achievements as different as success in competitive examinations, obtaining the doctorate, publishing articles or books, appointment to university posts, etc" [Bourdieu 1988: 88].
- 25 Following Bourdieu, symbolic power is "the power to constitute the given by stating it, to create appearances and belief" and "is only effective if it is recognised as legitimate (that is to say, if it is not recognised as arbitrary)" [Bourdieu 1977:17].

FORM II-A

[See Rule 4A(1)]

Form of general notice to be given to the members of the public before making an application to the Central Government under sub-section (2) of Section 22 of the Monopolies and Restrictive Trade Practices Act, 1969.

NOTICE

It is hereby notified for the information of the public that Usha Martin Industries Limited proposes to make an application to the Central Government in the Department of Company Affairs, New Delhi, under sub-section (2) of Section 22 of the Monopolies and Restrictive Trade Practices Act, 1969, for approval to the establishment of a new undertaking/unit/division. Brief particulars of the proposal are as under:

- | 1. Name and address of the applicant | USHA MARTIN INDUSTRIES LIMITED
14, Princep Street, Calcutta - 700 072. | | | | | | | | | | | | | | | | | | | | | | | | | | |
|---|--|--------------------|------------------------|--|---------|--|-------|---|-------|--|----------------|--------------------------------------|--|--|--------|------------------------------|------------|--|--------|--|--|--|---|--|--------------|--|--------|
| 2. Capital structure of the applicant organisation | <table border="0"> <thead> <tr> <th>Authorised Capital</th> <th>Amount (Rs in lacs)</th> </tr> </thead> <tbody> <tr> <td>1,44,00,000 Equity Shares of Rs. 10 each</td> <td>1440.00</td> </tr> <tr> <td>20,000 9.5% Cumulative Redeemable 'B' Preference Shares of Rs 100 each</td> <td>20.00</td> </tr> <tr> <td>40,000 11% Cumulative Redeemable 'C' Preference Shares of Rs 100 each</td> <td>40.00</td> </tr> <tr> <td></td> <td><u>1500.00</u></td> </tr> <tr> <td>Issued, subscribed & paid-up capital</td> <td></td> </tr> <tr> <td>85,10,200 Equity Shares of Rs. 10 each</td> <td>851.02</td> </tr> <tr> <td>Less: Allotment money unpaid</td> <td><u>.09</u></td> </tr> <tr> <td></td> <td>850.93</td> </tr> <tr> <td></td> <td></td> </tr> <tr> <td></td> <td>40,000 11% Cumulative Redeemable 'C' Preference Shares of Rs.100 each</td> </tr> <tr> <td></td> <td><u>40.00</u></td> </tr> <tr> <td></td> <td>890.93</td> </tr> </tbody> </table> | Authorised Capital | Amount (Rs in lacs) | 1,44,00,000 Equity Shares of Rs. 10 each | 1440.00 | 20,000 9.5% Cumulative Redeemable 'B' Preference Shares of Rs 100 each | 20.00 | 40,000 11% Cumulative Redeemable 'C' Preference Shares of Rs 100 each | 40.00 | | <u>1500.00</u> | Issued, subscribed & paid-up capital | | 85,10,200 Equity Shares of Rs. 10 each | 851.02 | Less: Allotment money unpaid | <u>.09</u> | | 850.93 | | | | 40,000 11% Cumulative Redeemable 'C' Preference Shares of Rs.100 each | | <u>40.00</u> | | 890.93 |
| Authorised Capital | Amount (Rs in lacs) | | | | | | | | | | | | | | | | | | | | | | | | | | |
| 1,44,00,000 Equity Shares of Rs. 10 each | 1440.00 | | | | | | | | | | | | | | | | | | | | | | | | | | |
| 20,000 9.5% Cumulative Redeemable 'B' Preference Shares of Rs 100 each | 20.00 | | | | | | | | | | | | | | | | | | | | | | | | | | |
| 40,000 11% Cumulative Redeemable 'C' Preference Shares of Rs 100 each | 40.00 | | | | | | | | | | | | | | | | | | | | | | | | | | |
| | <u>1500.00</u> | | | | | | | | | | | | | | | | | | | | | | | | | | |
| Issued, subscribed & paid-up capital | | | | | | | | | | | | | | | | | | | | | | | | | | | |
| 85,10,200 Equity Shares of Rs. 10 each | 851.02 | | | | | | | | | | | | | | | | | | | | | | | | | | |
| Less: Allotment money unpaid | <u>.09</u> | | | | | | | | | | | | | | | | | | | | | | | | | | |
| | 850.93 | | | | | | | | | | | | | | | | | | | | | | | | | | |
| | | | | | | | | | | | | | | | | | | | | | | | | | | | |
| | 40,000 11% Cumulative Redeemable 'C' Preference Shares of Rs.100 each | | | | | | | | | | | | | | | | | | | | | | | | | | |
| | <u>40.00</u> | | | | | | | | | | | | | | | | | | | | | | | | | | |
| | 890.93 | | | | | | | | | | | | | | | | | | | | | | | | | | |
| 3. Management structure of the applicant organisation indicating the names of the Directors, including the Managing/Wholtime Directors and Manager, if any | <p>The Company is managed by a Board of Directors comprising of the following</p> <ol style="list-style-type: none"> 1) Mr B. K. Jhawar, (Chairman & Managing Director) 2) Mr Brij K. Jhawar (Vice Chairman & Jr. Managing Director) 3) Mr B. P. Ray 4) Mr P. R. Deshpande 5) Mr R. K. Choudhury 6) Mr V. C. Vaidya 7) Dr R. Banerjee 8) Mr Prashant Jhawar 9) Mr Akhtar Alam (Nominee of PICUP) 10) Mr N. D. Shah (Nominee of ICICI) 11) Mr. B. L. Kinger (Nominee of LIC) 12) Mr S. K. Kumra (Executive Director) 13) Mr B. P. Tekriwal (Executive Director & Secretary) 14) Mr B. S. Jaiswal (Executive Director) | | | | | | | | | | | | | | | | | | | | | | | | | | |
| 4. Indicate whether the proposal relates to the establishment of a new undertaking or a new unit/division | The proposed undertaking will be a new unit of the Company | | | | | | | | | | | | | | | | | | | | | | | | | | |
| 5. Location of the new undertaking/unit/division | Paradip, Cuttack in the State of Orissa | | | | | | | | | | | | | | | | | | | | | | | | | | |
| 6. Capital structure of the proposed undertaking | Same as in item (2) above | | | | | | | | | | | | | | | | | | | | | | | | | | |
| 7. In case the proposal relates to the production, storage, supply, distribution, marketing or control of any goods/articles, indicate: | | | | | | | | | | | | | | | | | | | | | | | | | | | |
| (i) Name of goods/articles | Steel Bars | | | | | | | | | | | | | | | | | | | | | | | | | | |
| (ii) Proposed licensed capacity | 4.50,000 MT | | | | | | | | | | | | | | | | | | | | | | | | | | |
| (iii) Estimated annual turnover | Rs. 34510 lacs (on full capacity) | | | | | | | | | | | | | | | | | | | | | | | | | | |
| 8. In case the proposal relates to the provision of any service, state the volume of activity in terms of usual measures such as value, income, turnover, etc | Not applicable | | | | | | | | | | | | | | | | | | | | | | | | | | |
| 9. Cost of the project | Rs. 200 crores | | | | | | | | | | | | | | | | | | | | | | | | | | |
| 10. Scheme of finance, indicating the amounts to be raised from each source | Internal generation, issue of Shares & Debentures and borrowings in accordance with Government guidelines and as approved by Financial Institutions and Government Authorities. | | | | | | | | | | | | | | | | | | | | | | | | | | |

Any person interested in the matter may make a representation in quadruplicate to the Secretary, Department of Company Affairs, Government of India, Shastri Bhawan, New Delhi, within 14 days from the date of publication of this notice, intimating his views on the proposal and indicating the nature of his interest therein.

Structure of Indian Economy As Seen from CSO's Input-Output Tables

V V Divatia

This article seeks to present the basic framework of the input-output tables in the Central Statistical Organisation's Input-Output Transaction Tables for the Indian economy, examine some aspects of the framework as also the data and make some suggestions with a view to improving the utility of this very powerful tool for analysing the structure of the economy.

CENTRAL STATISTICAL ORGANISATION (CSO) has brought out *Input-Output Transaction Tables 1983-84*, (IOTT), for the Indian economy, the publication itself being dated 1990, and the preface, September 1990. The publication is in continuation of the previous such issues for earlier years. IOTT, 1968-69 was published in 1978; for 1973-74 in 1981, and for 1978-79 in 1989. The 1968-69 IOTT was prepared jointly with the Planning Commission but thereafter singly by the CSO. The 1990 issue carries three chapters, four appendices and seven matrices and all taken together, the data given in the publication is extremely useful for the study of the structure of the Indian economy for the stated years and changes in the structural parameters over the span of 15 years although the data are not available in the form of a continuous time series. It would indeed be too much to expect such a series and secondly at least over a short span of time period the structural parameters are not expected to change much. The introductory chapter explains the basic approach adopted for issues such as the scheme for sectoral classification, valuation of transactions, balancing, etc. Chapter 2 explains the methodology followed in estimating and allocating the sectoral inputs and outputs as also the method followed for the generation of various components of final demand and indirect taxes. Chapter 3 carries a brief analysis of the IOTT, 1983-84 along with comparisons with the IOTT results for the stated previous years. We shall refer to the various relevant appendices and matrices in the course of our discussion of the IOTT, 1983-84. It may be mentioned however that the mathematical treatment for the construction of the IOTT is a useful addition to the previous publication for IOTT, 1978-79.

The IOTT is based on 115-sector classification both for industries and their characteristic products, called commodities. For the publication, however, the number of sectors is reduced to 60 through consolidation of sector data. In the series of seven matrices, matrix 1, the Absorption matrix, and matrix 2, the Make matrix, are the basic ones. Others are derived from these two. The first one is a commodity \times industry matrix, commodities being recorded along the rows and the industries and final uses down the columns. Structurally, entries along a given row represent inputs into different industries and final uses and down the column, entries represent the material consumption of com-

modities. When inputs are aggregated for a given industry, we get the total material consumption in the row 61. Since all these inputs are valued at producer's cost, indirect taxes paid on these inputs are aggregated in row 62 so that along with material inputs at producer prices we have the figure at purchase price which no doubt the industries pay for their inputs. They also pay for trade and transport charges over and above indirect taxes but these, after segregation, are shown as service inputs against the relevant commodity rows. The last row, No 64, gives the total outputs of the 60 industries and their aggregate total and the aggregates of final use components. The components of final use are: (1) private final consumption expenditure (PFCE), (2) government final consumption expenditure (GFCE), (3) gross fixed capital formation (GFCF), (4) change in stocks (CIS), (5) exports (EXP) and (6) imports as a deduct entry. We shall dwell on this last component, imports, at some length later on. The last column yields total output of each of the 60 commodity sectors and below that the grand totals of commodity outputs, total indirect taxes, and total GVA. Since each industry sector may produce more than its main commodity, it is not necessary that the same industry and commodity sector totals tally. The Make matrix (matrix 2), on the other hand, is an output related industry \times commodity matrix, in which a row (i.e., industry) shows commodity outputs of its corresponding industry. Thus, for instance, cotton textiles industry (row 16) gives figures of commodities produced by it as one reads them along this row. Read down the column, we get figures for a given commodity produced by different industries. Matrix 3 is nothing but input-output matrix of coefficients expressed in terms of proportions of each element or cell of the inner 61×61 matrix to the total column (i.e., total gross output). It is derived from matrix 1. The total of all the coefficients for each industry (i.e., column) is taken in row 61 and this gives the proportion of all inputs at producer's price to the corresponding gross output for each column. What remains then is the balance in the shape of the sum of proportions of indirect taxes and GVA. These residuals are not given in matrix 3. Matrix 4 and 5 are based on the Make matrix. No 4 is called the Product matrix which shows coefficients in terms of proportions of elemental output to the total output of its respective industry. Thus for a given in-

dustry sector, these figures show the proportions in which different commodities are produced by this industry. Hence the name Product Mix matrix. No 5 matrix on the other hand presents figures in terms of proportions of elemental cell figures to their respective commodity sector output, indicating how a commodity's output is made up from different industries. This matrix is designated as the Market Share matrix. Matrix 6 is a commodity \times commodity matrix derived through the use of matrix algebra from the foregoing other matrices. This one is similar to the Absorption matrix in its structure except that instead of a commodity \times industry matrix we have a commodity \times commodity matrix. The last one provides us with the Leontief inverse matrix for the commodity \times commodity matrix.

This somewhat elaborate introduction seems necessary in order to make the write-up to follow more meaningful. We may also have to further explain certain features of the IOTT as we go along. The data sources, the methodology adopted to construct the two basic matrices, and the matrix algebra used in setting up associated matrices have all been explained succinctly in the Report on IOTT, 1983-84 in chapters 1 and 2, and Appendices I and II. Appendix III describes commodity/industry specifications for the 115 sectors and Appendix IV explains the aggregations to evolve the 60-sector classification. It is not possible to reproduce all the above matrices here, but prototype matrices for condensed classification by primary, secondary, etc. sectors are inserted instead. Matrices in A series are worked out from the Absorption matrix and the proportions of elements to total output of commodities and to total industry sectors—primary, secondary, etc. Matrices in B series are based on modified matrix A. The C series matrices are for Make matrix on similar lines.

ANALYSES AND COMMENTS

Chapter 3 of the IOTT, 1983-84 gives a brief analysis of the input-output transactions. Comparative figures for earlier years 1968-69, 1973-74, and 1978-79 are also given in the condensed Tables 3.1—3.6. It has been noted that the sector classification of 1978-79 is slightly different from that of 1973-74 but that for 1978-79 and 1983-84 it is exactly the same. The slight difference is due to the fact that 'aircraft' is now included in sector 44, miscellaneous manufacturing,

whereas earlier it was in sector 43, other transport equipment. Further, it has been claimed that the coverage of the economy in the IOTTs is consistent with the National Accounts Statistics (NAS). Hence both sets of aggregates should be comparable. Before going into the details of the inter-industry relationships and final expenditure patterns, let us examine the comparability of the IOTT and NAS figures. We first note the following macro relationship:

Total Resources

1 Gross value at market price + 2 Imports

Final expenditure

3 PCFE + 4 GFCE

5 GFCF + 6 CIS

7 Exports

Or briefly stated, total resources equal total expenditure, both at market price. For 1983-84, figures in Rs crore are as follows according to both sources:

| | IOTT | NAS 1990 |
|-----------|----------|----------|
| GVA at fc | 1,85,815 | 1,85,991 |
| Ind Tax | 20,866 | 20,866 |
| Imports | 17,675 | 17,675 |
| Total | 2,24,356 | 2,24,532 |
| PCFE | 1,45,999 | 1,46,084 |
| GFCE | 21,141 | 21,141 |
| GFCF | 38,320 | 39,991 |
| CIS | 5,857 | 6,083 |
| EXP | 13,139 | 13,139 |
| Total | 2,24,356 | 2,26,438 |

While official figures such as indirect taxes, imports, and exports completely tally, those for GVA, PCFE, and GFCE, match at Rs '000 crore level, and the capital formation components GFCF and CIS show some higher differences. However, even in the NAS, 1990 (Statement 7, pp 22-23), Gross Capital Formation figure differs from the sum total of GFCF and CIS by Rs 3,117 crore. Hence some differences between the figures of IOTT and NAS may be expected to some extent even when 'complete consistency' is claimed. The differences appear to be much more glaring for 1978-79 IOTT as can be seen from the following aggregates:

| | IOTT | NAS 1989 |
|-----------|--------|----------|
| DGP at fc | 88,873 | 93,880 |
| PFCE | 70,399 | 75,242 |
| GFCE | 9,526 | 9,722 |
| GFCF | 17,098 | 18,876 |
| CIS | 2,693 | 4,342 |
| Ind tax | 14,297 | 10,310 |

Since IOTT, 1978-79 was published in 1989, it may be presumed that figures therein are based on the revised concepts, methodology and sources and since 'manual balancing' is done to balance the IOTT entries for ultimate internal consistency, it must have also received CSO's attention for achieving consistency vis-a-vis NAS figures. In any case, some reasonable measure of consistency is desirable between the main ag-

gregates of both the sources.

Chapter 3 of the IOTT, 1983-84 gives comparative figures in its Tables 3.1, 3.2, 3.4 and 3.6 for all the four years for which IOTTs are constructed. Presumably, however, for 1968-69 and 1973-74, IOTTs are not based on the figures of the revised series and to that extent, comparisons may be affected, particularly because the latest revisions are quite substantial in certain directions, certain sectors and for certain aggregates. This has been recognised by the CSO itself. Limitations arising out of these various considerations may therefore be kept in view while dwelling on the temporal changes.

The main advantages of having IOTTs are three-fold. One, they provide a framework for studying interrelationships among industries as well as their distributional patterns and levels as between the inputs and final demand components. Secondly, they afford us a powerful apparatus for at least short term projections, given certain constancy conditions. Thirdly, they also enable us to visualise in quantity or value terms the effects of making changes in one of the figures on others in the IOTT. Apart from providing the figures as a framework, the IOTT Report does not give any examples of various other exercises which need to be carried out to throw light on the other two

aspects of the utility of the IOTTs. Nor does one see much concrete evidence of such exercises having been carried out for planning and other purposes, at least in recent years. It would indeed add to our knowledge if such exercises are carried out and results published or if they are being already carried out, make them available for wider dissemination.

Analysis presented in Chapter 3 is through highly summarised versions of the main matrices. Tables 3.1 and 3.2 summarise the transactions for two sectors—commodities and services. The former comprises primary and the secondary sectors and the latter, the tertiary sector. In passing one may point out that IOTT Report (p 15) categorically states that 'the tertiary sector includes construction, electricity, gas, water supply'. There is no way in which one can consider these activities as part of the tertiary sector. It is therefore a relief to find that in the tables, these activities are in fact included in the secondary sector, in the above tables, in the commodities sector.

Table 3.1 for 1983-84 shows that commodities utilise 40.3 per cent of its own commodity output for intermediate consumption and that this percentage increased from 33.6 in 1968-69 to 34.5 in 1973-74 and 39 in 1978-79 indicating an increasing trend. It is

| 9 Total output | 28.47 | 42.96 | 16.06 | 9.90 | 2.61 | 100.00 | 58.34 | |

Note: Corresponds to Table 3.1 of IOTT Report with sectors changed

trend mainly because of the compactness of the sector. Part of the reason could be change in the output in favour of the secondary sector *within* the commodities sector, which naturally consumes proportionately more material inputs than the primary sector. Reference to Table 3.5 in fact brings out this change to some extent. Thus for 1983-84 the primary sector used up 16.7 per cent of its own output and 8 per cent from the secondary sector as material inputs, i.e., 24.7 per cent of the commodity sector, whereas secondary sector used 15.4 per cent of its own output from the primary sector and 33.9 per cent from its own sector; i.e., 49.3 per cent of its output as inputs into the commodity production. And although the percentages of values of inputs flowing from the commodity sector to the primary and the secondary sectors have not increased over the years, the overall relative shift in the output in favour of secondary sector makes for the observed increasing trend seen in Table 3.1. Table 3.4 also shows that while 39.2 per cent of the total primary sector commodity output used as intermediate inputs (IUSE) flows into the primary sector industries and as much as 54.8 per cent into the secondary sector, only 11 per cent of the total secondary sector commodities is used up as inputs go into the primary sector industries and as much as 70.4 per cent into its own industry sector. All this combined probably makes up for a rising trend observed in Table 3.1. A

second feature of figures in Table 3.1 is that the percentage for service sector inputs into commodity sectors is also substantial, being 24.4 per cent for 1983-84 as compared to only 13.1 per cent of total service sector output. This is understandable since production processes depend a great deal more on trade, transport, communication and other services including finance, insurance, etc.

It is obvious that percentages of input flows will vary with the level and type of sector classifications adopted according to the purposes in view. However, the overall percentage of all inputs as intermediate consumption—whatever the sectoring—to the aggregate of all industry sectors must of necessity remain the same. This percentage was 44 for 1983-84, and has also shown a steadily increasing tendency over the previous IOTT years, from 36.8 per cent in 1968-69. The same figures therefore appear in Tables 3.2, and 3.5. Correspondingly, the share of final uses has shown a decline to 56 per cent from 63.2 in 1968-69. Item 4 on indirect taxes brings out their increased share of 48.5 per cent from 37.2 in 1968-69 and a declining share in both the services sector and final uses (1983-84 showing some rise). GVA has also tended to decline in relative terms as against increasing share of services sector industries. Table 3.2 yields more or less the same pattern when the figures are considered in terms of inputs as percentages of each sector. As for indirect taxes on the inputs, commodity industry sector takes up

9 per cent of the total output of that sector and indicates increased proportion as compared to first two years of the IOTTs. For the service industries, the percentages are much less at 2.4 per cent for 1983-84 and 3.6 per cent for 1968-69. Final uses account for 3.7 to 4 per cent of their aggregate value. GVA as percentage of the respective outputs has declined for both the sectors. Unless the declines noticed in Tables 3.2 and 3.5 and those observed in the previous paragraph are due to structural changes such that they take up higher proportions of their outputs as intermediate consumption more attention would need to be paid to such declines in GVA lest we have an economy operating on more inefficient use of domestic resources. The question why there is such decline in all the sectors—primary, secondary, trade and transport (refer Table 3.5 of IOTT)—other trade sector only showing contrary trend, and why overall, GVA to output ratio has declined from 60.3 to 52.4 per cent seems to need more in-depth analysis.

Matrix 3, as mentioned earlier, gives coefficients of commodity inputs expressed as fractions of the total output of each industry. It is difficult to go through the matrix industry by industry but we may try to bring into focus some basic aspects. In the agriculture and allied industry field (sectors 1 to 7), we notice that the highest fraction for total input (row 6) is in the animal husbandry sector (No 5), its value being 0.508045, meaning over 50 per cent of its value of total output is taken up by inputs. This is largely because feed costs for animals, particularly pigs and poultry, are relatively heavy and make for a high cost industry. At the other end, forestry and logging and fishing (sectors 6 and 7) have the lowest total input coefficients. They are the lowest among all the coefficients. It is interesting to note that in agriculture proper, coefficients for total inputs are higher for food crops (No 1), than for cash crops (No 2), plantation crops (No 3), and other crops, the respective values being 0.305314, 0.22481, 0.139917, and 0.148750. Presumably this is related to the relatively higher ex-farm final prices which crops other than food crops fetch in the market. In the mines and minerals sectors (Nos 8-11), 'crude petroleum, natural gas' (No 9) has the lowest coefficient, indicating high GVA proportion.

(Rs crore)

NOTICE

It is hereby notified for the information of the public that **MUKAND LTD** proposes to make an application to the Central Government in the Department of Company Affairs, New Delhi under sub section (2) of Section 22 of the Monopolies and Restrictive Trade Practices Act, 1969 for approval to the establishment of a new undertaking/unit/division. Brief particulars of the proposal are as under:

- | | |
|--|--|
| 1. Name and address of the Applicant | MUKAND LTD. Lal Bahadur Shastri Marg Kurla Bombay 400 070 |
| 2. Capital structure of the applicant organisation | Authorised capital Rs. 25.00 crores Paid up capital Rs. 14.73 crores |
| 3. Management structure of the applicant organisation indicating the names of the Directors including Managing/Whole-time Directors and Manager if any | The Board of Directors consists of Viren J. Shah (Chairman & Managing Director) Ramkrishna Bajaj (Vice Chairman) D.S. Mulla J.P. Thacker Rahul Bajaj D.S. Mehta Partap Kewalramani D.K. Lodaya C.S. Dharmadhikari Dr. N.P. Jain Narendra J. Shah Rajesh V. Shah Niraj Bajaj Vinod S. Shah Sukumar V. Shah |
| 4. Indicate whether the proposal relates to establishment of a new undertaking or a new unit/division | Proposal relates to manufacture of new articles by the existing undertaking |
| 5. Location of the new undertaking/unit/division | Zadgaon District Ratnagiri Maharashtra |
| 6. Capital structure of proposed undertaking | Not Applicable |
| 7. In case the proposal relates to the production, storage, supply, marketing or control of any goods/articles, indicate: i) Names of goods/articles ii) Proposed licensed capacity iii) Estimated annual turnover etc. | Hot Rolled Flat Steel Products 250,000 tonnes per annum Rs. 313 crores on full operation |
| 8. In case the proposal relates to the provisions of any service, state the volume of activity in terms of usual measures such as value, income, turnover etc. | Not Applicable |
| 9. Cost of the project | Rs. 350 crores (Approximately) |
| 10. Scheme of finance indicating the amounts to be raised from | The cost of the project will be met by debentures, loans from financial institutions and internal generation. |

Any person interested in the matter may make a representation in quadruplicate to the Secretary, Department of Company Affairs, Government of India, Shastri Bhavan, New Delhi, within 14 days from the date of publication of this Notice intimating his views on the proposal and indicating the nature of his interest therein.

P.C. CHHAJLANI
SECRETARY

Dated this 6th day of May 1991

Only 10.13 per cent of the total output is accounted for by total inputs. In contrast to both these groups, the processing industries of the secondary sector, like sugar, food processing, etc, right up to jute textiles (sectors 12-18), processing as they do large quantities of basic raw materials like sugarcane, cotton, jute, etc, belonging to the primary sector inevitably show up high total input proportions to total outputs, coefficients ranging from 0.541209 for tobacco to as high as 0.873724 for food processing. Sugar is also high at 0.791440. For the manufacturing industries as such, the average figure is 0.6357 (i.e., 63.57 per cent). Among those which have much higher values than the average may be mentioned petroleum products (0.829849) and coal/tar products (0.906785).

It is interesting to observe that while in the case of petroleum products, 64.48 percentage points out of 82.98 per cent are accounted for by crude, and small percentages by several other commodities, coal/tar products' inputs pattern shows 35.37 percentage points from basic material, viz, coal and lignite, and quite substantial inputs from trade (15.60 per cent) and railway transport services (14.16 per cent). In the services sector, the coefficients are generally low, the only sectors showing higher than 50 per cent total inputs are railway transport services (No 48) and hotels and restaurants (No 53) and medical and health (No 58), respective values being 51.87, 71.46 and 59.07 per cent.

It is a point for note that the IOTT for West Bengal (WB) for 1973-74 published presumably in 1985 (as can be conjectured from the foreword dated January 1985) by the WB Planning Board, analyses the structure in terms of backward and forward linkages worked out through the Chenery and Watanabe (CW) formula. This formula defines backward linkage as "total non-primary input per unit of output for a sector" and forward linkage as the ratio of that part of the i-th sector which is utilised as inputs by other sectors to the total demand for the i-th sector. The WB IOTT Report also mentions Rasmussen definitions for these linkages based on the dispersions of 'linkage inducements'. WB Board has used the CW formula slightly modified to suit its regional purpose and classified the various sectors into four groups: (1) intermediate manufac-

ture, (2) final manufacture, (3) intermediate primary production and (4) final primary production. Whatever limitations WB Report may have otherwise, it has to be said to its credit that it has made an attempt to analyse the inter-industry relationships through recognised indicators. No such analysis is done by CSO in its IOTT Report. It would indeed be useful to work out such linkages calculated for all the IOTT years and study the changes therein. Whether one or the other formula is to be adopted may be considered from the point of view of its appropriateness. WB Report also includes values of other indicators such as wage multiplier and value added multiplier, on which also CSO report appears to be silent.

Before going on to discussion of final uses, a word may be said about the term used in the summarised Tables 3.1 and 3.2. While the main matrices use the term 'commodity' in the SNA sense to include both goods and services, the tables have the restricted meaning of goods only and include outputs of primary and secondary industries outputs. This is likely to cause some avoidable confusion. It may be appropriate to use some other term not only to avoid confusion but also to conform to SNA terminology.

FINAL USES

Now about the final uses. The components are as mentioned earlier: PFCE, GFCE, GFCE, CIS, Exports, and Imports (as a deduct entry). The sum total is defined as final use (FU) which according to paragraph 3.2 of the Report is equivalent to final demand. Both the terms can therefore

be used interchangeably. All these components appear as column vectors in the absorption matrix and commodity x commodity matrix (No 6). These vectors are as is well known exogenous to the inter-industry matrix which provides figures for each commodity sector's use as intermediate consumption or inputs. One result of showing imports as a deduct entry column vector is that even imports used as inputs in economy activity are treated as final demand and hence inputs are overstated and final use is understated. Although imports are about 5 per cent of total domestic output, for certain sectors these are very high, as we shall see in a moment and for these commodity sectors, understatement is rather disturbing. If there was any specific advantage in adopting this non-standard procedure, one would have been happy to accept this departure. On the contrary, knowledge and interpretation of distribution of domestic outputs become almost impossible. There is no way by which one can work out figures for each commodity sector as regards extent of imports used as inputs and of imports in different components of final demand. If we look at matrix 1 of the CSO, we notice some entries under the column of 'total final use' which, to say the least, make strange reading. For instance, for sector 9 (row-wise), 'crude petroleum, natural gas' final use is Rs (-)2,335 crore, whatever it may mean. Other components of final demand add up to Rs 1,206 crore. Intermediate consumption is high at Rs 5,296 crore. Can we say that final use was - 78.9 per cent of the output? Arithmetically, yes; but one is puzzled as to what is the economic content of such a

TABLE B 3: MODIFIED FINAL DEMAND MATRIX
(Per Cent to Column Totals)

| Commodity/Industry | Total Findem 1 | Total Use 2 | Less Imports 3 | Total Output 4 |

figure. If imports were mentioned as a row vector and imports figures were shown under appropriate columns as row vector elements, interpretation would have been clear. Similar appears to be the case for sector 35, 'iron and steel industry and foundries' and sector 36, 'other basic metal industry' which have large imports all of which are shown as final use even when some portions, even large ones, may have been used as inputs into further production. For the same reasons percentages given in Table 3.1 of the CSO Report are not of much use. We have appended Table A.2 similar to CSO's Table 3.1 but with primary, secondary, etc., industries as sectors. Table A.1 appended here gives absolute figures and Table A.3 corresponds to Table 3.5 of CSO. Similar set of Tables B.1, B.2 and B.3 are included by totalling inputs and final expenditures (FEs) defined as the sum of final use element for each row without deducting out imports to obtain total use (TU) and keeping the import vector outside. This slight modification may give a slightly better picture of proportions but it must be understood that these are not related to domestic outputs and we still do not have the much required knowledge of distribution of imports among inputs and final demands.

It may be relevant in this connection to scan through some alternative methods of treating imports in the input-output tables. Earlier tables for some advanced countries such as UK, USA, etc., have their imports shown as row vectors. The condensed ver-

sions of some of these matrices can be seen in R.G.D. Allen's *Mathematical Economics* and Klein's *An Introduction to Econometrics*. Klein has specifically stated that alternative treatments would be feasible for the foreign sector. These are: (1) Deducting imports from exports and including the figures as net exports in final demand. CSO seems to have opted for a similar alternative, although no justification is advanced for adopting the chosen treatment in preference to the others. CSO does however give imports figures explicitly instead of netting them out with exports. (2) Treat imports as competitive with home production and distribute them together with domestic outputs along the rows of each industry producing the corresponding goods at home. (3) Introduce additional sector column for exports and row sector for imports inside the transaction matrix. This would involve subtracting exports from the final demand sector. In the UN's SNA commodities are classified as competitive, meaning such commodities are both domestically produced and imported, and complementary, meaning they are only imported and not indigenously produced. In the SNA's treatment, competitive imports are clubbed with corresponding domestic produce in the matrix and only complementary part is shown in row vector. In case there are more sectors than one for the latter category of commodities more than one row vectors are introduced. For our purpose, we shall talk in terms of a single row vector to cover both the situa-

tions. The important point to note is that imports are treated in row sectors and not as a column vector. SNA does not seem entirely averse to showing all imports in row vector and only domestic produce in the transaction matrix but certain disadvantages of combining competitive and complementary import have been pointed out in the SNA. One could even then think of having both the competitive and complementary components shown separately but outside the transaction matrix to meet the objections set out in the SNA.

One disadvantage of showing total imports as a row vector is that "if the competitive and complementary components of a given commodity group (such as mining industry) were amalgamated, it would follow that a country with any kind of mining industry would be deemed to meet at least part of the demand for all mining products even if some of these products were not in fact produced in the country." This objection may not perhaps hold if both components were shown separately outside the transaction matrix. The second objection is that separating competitive component from the combined figure of domestic and competitive commodity may present difficulties since it is the total supply of inputs that is known. It has been argued later in this article that this may not be so although there is no doubt that some more effort may be necessary. For a developing country like India, it is most important to know the distribution of imports to user industries and for final use, for both the components of imports. The least however that CSO can do is to adopt the SNA recommended treatment of imports. Not to do so would also impair international comparability in terms of technical coefficients. Further, one of the main uses of input-output tables is to make projections. Such projections in the area of import-related topics such as effects of import substitution, changes in the relative importance of import content of import-intensive processes, etc., may not perhaps be possible. Even other exercises may have to be carried out under the assumption of constancy of imports to domestic proportions for all elements of the matrix. Also, Leontief's input coefficients will be overstated since the elements of the transaction matrix are inclusive of imports. The extent of overstatement for individual elements would remain unknown. All considering, it seems a serious departure on the part of the CSO to have shown imports as a column vector (as deduct entry) instead of adopting the normal or SNA recommended practice.

If there is no particular advantage for the adopted procedure, does CSO have any particular difficulty in segregating imports from each element of the matrix and combine them to evolve a row vector? On the face of it, none. The reason is this. Imports are mentioned at cif values and no import duties have been shown in the import vector. Therefore indirect taxes on these must have

| 6 Total | 1.0000 | 1.0000 | 1.0000 | 1.0000 | 1.0000 | 1.0000 |

been included in the corresponding tax row vector. Also, each commodity value in the matrix is valued at producer prices by deducting from the purchase priced values indirect taxes and service charges. The taxes including import duties are aggregated in the row vector. It follows that CSO must have figures of import contents for each element of the matrix. If this is so there should be no difficulty in aggregating these imports or at least the complementary imports into a single vector row. One hopes that CSO will consider at the earliest how best imports can be treated according to normal practice. It may be worthwhile to point out that a large percentage of imports is accounted for by a small number of commodities as can be seen below.

| Sector Imports Value for Each Commodity (Rs Crore) | No of Commodity Sectors | Sector Nos | Amount (Rs Crore) |
|--|-------------------------|--|-------------------|
| ≥ 1,000 | 5 | 9 26, 34 35 | 9,030 (51.09) |
| 500-999 | 6 | 1 13 32 41 44 49 | 4,619 (26.13) |
| 100-499 | 15 | 4 5 11, 17 22, 23 28 29 30 33 36 37 39 43 59 | 3,476 (19.67) |
| < 100 | 34 | Others | 550 (3.11) |
| Total | 60 | | 17,675 (100.00) |

Proper allocations of imports of the two highest groups to industries and final demands would take care of accuracy for 77.22 per cent or over three fourths of the imports in the row vector.

Here again it may be mentioned that the WB matrix referred to earlier does follow the standard procedure in regard to imports although it defines competitive and complementary imports somewhat differently.

MAKE MATRIX

While the Absorption matrix relates to inputs and final uses of commodities and is a commodity \times industry matrix, the Make matrix relates to outputs of commodities by industries and is an industry \times commodity matrix. Read along the row we obtain figures of different commodities produced by the given industry. Taking food crops (sector 1) row, notice that output in row 1, column 1 (or 1-1 for short), is Rs 34,870 crore. Balance of the total food crops industry output (of Rs 40,588 crore) is accounted for by some other commodities. It means that this same industry produces 85.91 per cent of its output as food crops and 14.09 per cent as some other commodities. Along the column we notice the

same figure in cell (1,1) and the total commodity output is Rs 34,926 crore so that of the total commodity sector 1 produce, 99.84 per cent comes from food crops industry sector and only a paltry 0.06 per cent from other industries. Proportions in which a particular industry produces various commodities, as in the former case, are coefficients of the product matrix and proportions in which various industries produce a particular commodity are coefficients of the market share matrix. In both the cases the diagonal coefficients have highly predominant values reaching 1 in several cases for which such commodities are produced in their own industry sector and these industries do not produce any other commodities except for their own respective sectors.

In the product mix matrix, 22 out of the 60 industries have unit diagonal coefficient, 26 have coefficient values between 0.9 and less than 1, and the lowest diagonal value is for textile products (0.644171). Over one third of output of this industry is accounted for by 'other services' (No 59). Miscellaneous manufacturing industry (No 44) produces a number of commodities and although off-diagonal coefficients are low they are distributed over 29 commodities other than its own characteristic product. Construction, electricity, and all services except 'railway transport services' depict unit coefficients. Generally speaking, primary industries and services sectors show high diagonal coefficients. It is in the manufacturing sectors that wider spread of off diagonal coefficients are to be found.

The market share matrix (matrix 5 of IOTT) should be titled industry \times commodity and not commodity \times industry one because of the manner in which the results are presented. Percentages therein are taken to column figures which in effect are commodity output. With this correction, it is seen that 18 commodities have unit values as diagonal coefficients. Six primary sectors, construction and 11 services sectors all have unit values in diagonal. Only trade and 'other services' in the tertiary sector have less than 1 value in the diagonal cells. This is understandable since contribution to these sectors comes out of several industries. It is the manufacturing sectors which show a more varied pattern. Railway transport equipment (No 42) shows only 0.505090 as diagonal coefficient but unlike in the case of 'other services' this commodity sector's remaining output comes from only two industries 'other transport equipment' (No 43) and 'railway transport services' (No 48). It has to be added that no such problems relating to imports as encountered in studying the Absorption matrix exist in the case of Make matrix and the related product and market share matrices. For ready reference, C series matrices for condensed sectors are appended to this article.

Commodity \times commodity matrix, matrix

NOTICE

It is hereby notified for the information of the Public, that Reliance Petrochemicals Limited propose to make an application to the Central Government in the Department of Company Affairs, New Delhi, under sub-section (2) of Section 22 of the Monopolies and Restrictive Trade Practices Act 1969 for approval to the establishment of a new undertaking/unit/division. Brief particulars of the proposal are as under:

1. Name and address of the applicant: Reliance Petrochemicals Limited, RPL House, 15 Walchand Hirachand Marg, Ballard Estate, Bombay 400 038.

2. Capital Structure of the Applicant Organisation: Authorized Capital: Rs 1,000 Million. Issued & Subscribed: Rs 72.50 Million.

3. Management structure of the Applicant Organisation indicating the names of the Directors including the Managing Director, Joint Directors & Manager: (a) Reliance Petrochemicals Limited, a body corporate managed by the Board of Directors consisting of: (a) Shri Dhurubha H. Ambani, Chairman & Managing Director; (b) Shri Mukesh D. Ambani, Director; (c) Shri Anil D. Ambani, Director; (d) Dr R. Rajagopalan, Director; (e) Mr. Ali S. Daryal, Director; (f) Mr. K. K. Patel, Director; (g) Mr. C. Chandrasekhar, Director; (h) Shri Yogendra P. Trivedi, Director.

4. Indicate whether the proposal relates to the establishment of a new undertaking or a new unit/division: New Unit.

5. Location of the new undertaking/division/unit: Hazira, Taluka Chhota, District Surat, Gujarat State.

6. Capital structure of Applicant Organisation: The proposed undertaking will be a unit of the applicant organisation and therefore will not have a separate capital structure.

7. If the case the proposal relates to the production of a new product, supply distribution, market, or control of any goods, article or service, Name of the goods/articles: Ethylene oxide. Proposed Total capacity: 10,000 TPA. Estimated annual turnover: Rs 150 Million.

8. In case the proposal relates to the provision of any service, state the volume of activity in terms of financial measure such as sales income or turnover: Not applicable.

9. Cost of the project: Not Applicable.

10. Scheme of Finance indicating the amounts to be raised from each source: Not Applicable.

Any person interested in the matter may make a representation in quadruplicate to the Secretary, Department of Company Affairs, Government of India, Shastri Bhawan, New Delhi, within 14 days from the date of publication of this notice. It shall be the duty of the proposer to attend the material of his interest therein.

FOR PUBLICATION: RELIANCE PETROCHEMICALS LIMITED

F. M. Rao

Deputy Company Secretary

is similar to the Absorption matrix, the only difference is that it shows inputs used up in producing commodities (instead of outputs of industry sectors), plus in meeting the final demands figures for which are the same as in the Absorption matrix. The same problems with which the Absorption matrix is beset and which have already been discussed at length exist in this case also. This matrix is derived with the help of matrix algebra given in Appendix II. Matrix 7 gives Leontief inverse coefficients for matrix 6 (commodity x commodity). Their use is mainly in carrying out various exercises for which input output matrices are set up.

CONCLUDING REMARKS

In the end, it may be useful to stress the following points in order to make India's official input output matrices a useful analytical tool for studying the structure of the economy and for projection exercises. First, the timeliness needs to be improved very considerably. Projection exercises are carried out on the basis of certain constancy assumptions of structural pattern in industry technology or commodity technology. The assumptions are workable only for short period projections and when economic structure is changing rapidly as should be the case for developing countries, it is important that IOTs are updated with as little time-lag as possible and in any case no more than two or three years. With improvements in the timeliness of data collection and in data processing capabilities this should not be now difficult. It is sad to note that the 1983-84 IOT was published in late 1990 or early 1991, a lapse of at least over six years. 1978-79 IOT was published after 10 years in 1989 and for previous reports delays have been for 8 to 10 years.

Secondly, serious thought should be given to the existing limitations of the Absorption matrix discussed above. It appears at least to this writer, that without rectifying the shortcomings, large part of the utility of input-output analysis would be lost even if timeliness is improved.

Thirdly, it would enhance the usefulness if the CSO carries out more in-depth analysis of the structure and also include some projection exercises relating to plan target settings, comparisons of actual achievements with figures emerging out of the application of most recent IOI under the usual constancy conditions, and so on. If these cannot be published in the report separate papers could be published. Perhaps such work is being done but then it should also see wider dissemination.

The purpose of this write up is to present the basic framework of the input output tables in the official IOI, study some aspects of the framework as also the data, comment on the contents of the report and make some suggestions purely from the point of view of furthering the utility of this highly powerful tool of analysis of the structure of the Indian economy.

NOTICE

It is hereby notified for the information of the public that UNION CARBIDE INDIA LIMITED proposes to make an application to the Central Government in the Department of Company Affairs, New Delhi, under sub-section (4) of Section 23 of the Monopolies and Restrictive Trade Practices Act, 1969 for approval to take over the whole or part of the new undertaking. Brief particulars of the proposal are as under:

1. Name and address of the applicant: Union Carbide India Limited
1 Middleton Street, Calcutta - 700 071
2. Name and address of the undertaking the whole or part of which is proposed to be taken over and the manner of take over i.e. acquisition of shares, acquisition of control or management whether by the acquisition of the ownership of the undertaking or under any mortgage, lease or licence or under any agreement or other arrangement: Triton Building Accessories Private Ltd (Proposed to be converted into a Public Limited Company - Triton Building Accessories Ltd)
302, Regal Chambers
Nariman Point
Bombay - 400 091
By subscribing 4 lakh (40%) Equity Shares of Rs. 10 each for cash at par.
3. Management structure of the applicant: The Company managed by the Chairman & Managing Director assisted by a Deputy Managing Director and three Whole time Directors subject to the superintendence and direction of the Board of Directors. Name of Directors are given below:
Mr. V.P. Gokhale - Chairman & Managing Director
Mr. K.M. Nayak - Deputy Managing Director
Mr. C.P. Lal - Whole time Director
Mr. Jyoti Bose - Whole time Director
Mr. U.K. Bhat - Whole time Director
Dr. Parag Anand
Mr. K. Datta
Mr. G.M. Kelkar
Mr. N.N. Lohar
Mr. B. K. Mittal
Mr. K. Narasimhan
Mr. C. S. Patil
Mr. P. L. Wint
Mr. K. A. Joshi - Alternate to Mr. P. L. Wright
4. Capital structure of the applicant: Authorized capital - Rs. 40,00,00,000 lakhs
Paid up capital - Rs. 39,58,33 lakhs
5. By the undertaking proposed to be taken over: Authorized capital - 40,00,00,000 Equity Shares of Rs. 10 each - Rs. 40 lakhs
Proposed to be increased to 40 lakh Equity Shares of Rs. 10 each i.e. Rs. 400 lakhs
6. Line of business of the undertaking which will or is likely to emerge as a result of the proposed take over: Triton Building Accessories Pvt. Ltd. is an existing company authorised to carry on the business of manufacture and deal in prefabricated building materials and components.
7. Consideration for the take over: Rs. 40 lakh for acquiring 40,00,00,000 (40%) Equity Shares of Rs. 10 each for cash at par.
8. Scheme of finance indicating the source(s) of finance for the proposed take over: Internal sources.

Any person interested in the matter may make a representation in quadruplicate to the Secretary, Department of Company Affairs, Government of India, Shastri Bhawan, New Delhi within 4 days from the date of publication of this notice intimating his views on the proposal and indicating the nature of his interest therein.

Gender Ideology in Bengal

Meera Velayudhan

EVEN as one appreciates Tanika Sarkar's search for 'standards for a new womanhood' (*EPW*, February 2) the attempt is riddled with problems as her very premise is faulty. Firstly, it lacks a certain historical perspective as evident in the tendency to generalise a single (middle class?) woman's culture and sphere. Secondly, by dismissing struggles as 'pure' practice, devoid of any underlying approach or analysis, the article reflects a persisting problem, the need to bridge the gap between women's studies and the women's movement.

Sarkar begins her article by suggesting that a 'genuine or ideal Left culture' can emerge in isolation and that the mandate received by the Left Front acts as a kind of barrier to the emergence of this ideal. For Sarkar, the 'development of the autonomous alternatives' cannot base itself on existing cultural traditions. Even 'the aspirations of the Renaissance fathers' that Sarkar discusses were rooted in prevailing cultural traditions. However, not only is Sarkar unconcerned with the social basis of cultural traditions and their historical context, she does not consider struggles as products, leave alone as determinants of culture.

This, we feel, arises from Sarkar's method of analysis in which the unit is the individual and the area of intervention, the ideological. Women's roles in Bengal, 'domestic, non-domestic', in the pre-colonial and post-colonial period have not changed nor do they appear to be changing. For Sarkar, a static, middle class, urban ideal is the problem and this had to be overcome. Post-independence struggles or even the struggles against authoritarianism and semi-feudal terror of the 70s, of which women, not only of the CPI(M) but of the entire Left and other democratic sections were the victims, the militant participation of women in struggles in particular, appear to hold no significance in the development of a new womanhood. The article, in fact, indicates an obsession with images rather than a serious attempt at analysis. The examples are many. We will mention a few.

Firstly, we are provided with a glimpse of prominent traditions for looking at womanhood in modern Bengal—writings of Bankim, Tagore; paintings of Jamini Roy; films of Ghatak, Ray, Mrinal Sen; works of Ramakrishna; novels of Shirshendu Mukhopadhyay and Sanjib Chattopadhyay, their celebration of the 'sacred mother', 'dangerous mother', 'non-mother', etc. These traditions apparently do not have any historical context. In this vast panorama of images, we do not find a word on the social basis of these images, whether they have changed or are changing, whether they are the same for women of all social classes.

In fact, the underlying middle class bias can be seen in the manner in which Sarkar views some of the issues. A simple example is Sarkar's comment on Mrinal Sen's film that 'the son's tragedy is that he cannot find a job, the daughter's tragedy is that she has found one.'

True, it is a tragedy for the son to be without work while for the daughter, having found a job it marks the beginning of one more long struggle and not the beginning of another tragedy. Here, it may not be out of place to cite a discussion on the film during a festival of films on women in Delhi in 1983. Reacting to the endless discussion on the dual role of women, a working class woman activist present said, "This talk of dual roles seems to get nowhere. Look, I faced similar problems. But I had to work, I was determined to work. So, I faced everything that came my way." In her assertion, one can already see the emergence of a new womanhood.

The undermining of or lack of interest in and concern with the struggles of women permeates Sarkar's search for the 'affirmative feminine figure'. Sarkar's discomfort with recording the real world participation of women in struggles/history leads her to marginalise the importance of struggles of tribal or peasant women and fault the concern of certain authors and readers with giving the struggles their due visibility in history and literature, as attributing non-conventional roles to only 'exotic and distant figures, not entirely real to the largely middle class authors or readers'. While reaching out for self-fulfilment or self-expression is not an unimportant issue, it is indeed poor theory to dismiss the militant and revolutionary roles of women 'as essentially a giving and nurturing role'. Women have, in fact, transcended many social barriers, transformed themselves and their society while participating in these struggles as active seekers for a new identity.

Middle class women may as well be exotic to the tribal and peasant women. It is indeed these different women and their struggles that constitute the quest for a new womanhood. The perception that tribal and peasant women are exotic seems to colour Sarkar's choice of issues. Therefore, the mass-scale rape and violence against 173 tribal women in recent months in Tripura for their association with AIDWA, the Left Front and the report of the fact finding committee of several women's organisations, covered extensively in *Peoples' Democracy* and some newspapers, are of no significance. The ongoing militant struggles of tribal women in Tripura are not exotic or distant to the Left movement, to the movement for democratic rights and women's rights in particular. What does self-fulfilment and self-expression, the concern of Sarkar, signify in the context of such struggles? The problem is one of placing issues in a historical context and the approach one adopts in analysing those issues. It is precisely this methodological error that leads to the omission of the issue of land reforms and land titles, women's participation in panchayats, their role in defining women's identity, in a discussion on women in Bengal and gender ideology.

A similar bias can be seen in Sarkar's con-

cern for 'non-domestic/non-party' roles of women. Women's political participation in organisations which are not women-specific ('the Party') are looked down upon and one can see an underlying, simplified assumption that 'non-domestic' roles will emerge in isolation from the democratic movement in general. Instead of analysing this crucial link, what we get are a few comments on what Sarkar imagines and considers as determinants of Left activity, i.e., the slogans, the red bordered saree, and not the least, Gupta's statement. This is not to say that the statement itself can be defended. It cannot be.

Be it the struggle against the Muslim Women's Bill, against sati, dowry, rape and other kinds of violence against women, the debate within and among women's groups and organisations and even some political parties did involve an attempt to discern the entire set of cultural values of the people. The point, however, for the democratic movement and the women's movement in particular, was to note the essential and secondary, the positive and negative, the progressive and reactionary and build up on the strengths. This is not to ignore the limits of struggle. Even as women are united by a new identity within an organisation they are still part of the contradictions of society. However, it is in these struggles that the process of overcoming these contradictions emerge. This is by no means simple and does involve continuous ideological intervention. It is also through struggles that women realise their crucial role, acquire a new knowledge about their immediate and future activity, increase their awareness of the responsibility for the direction of their lives—all of which are crucial to the emergence of a new womanhood. Studies on struggles of women workers provide some insight.

Women workers, such as those involved in petty production, say in the coir industry, in the forefront of working class struggles, are able to develop an identity as workers, as women workers, as members of an exploited class, as citizens, despite the structural characteristics of their work—isolated, home-based, conducive to the ideology of domesticity. The link with the general working class movement and the democratic movement has played a crucial role in the development of this identity. Yet, the development of a new perspective on women's social role among coir workers has a limit and these are structural and cannot be confined to the ideological alone. Therefore, without an insight into the dynamics of struggles, locating them in a historical context, statements such as Gupta's cannot be singled out as the ideology nor AIDWA dismissed as an extended family.

Today, in the face of rising communalism and attacks on even the existing rights of women, it is all the more important for the women's movement to build up wider links and alliances and not isolate itself. The struggles against the Muslim Women's Bill and sati are striking examples. We are sure that Sarkar does not intend to undermine this link. Any attempt to do so can only close up avenues for advancing the debate on women's issues, in which, defining

standards for a new womanhood are important

A comment on some of the terms Sarkar has used. Even as she is critical of the use of the term 'anti social' she inadvertently ends up

using the same term while mentioning the bandhs in Calcutta. Also, talk of 'Left Calcutta', 'party mouthpiece', etc. remind one of the days of the cold war. Cannot we, at least, avoid this?

Durability and Time-Frame of Industrial Retrogression

Partha Ray

IN their paper 'Where Is the Industrial Retardation?' (EPW, September 29 1990), S Chakrabarti and A Rudra (C R) have questioned the consensus about the industrial deceleration since mid sixties. They have arrived at the conclusion that the phenomenon of industrial retardation seems to have disappeared over the time span of 1961 to 1985. In this context, we feel that CR's neglect of the decade of the 1950s and selection of quantities of a few commodities as the relevant dependent variables of their growth rate equations are chiefly responsible for their novel findings.

Let us at the very outset make two methodological points (regarding their data base) clear, viz (a) C R did not think it 'either necessary or very reliable' to construct any index of industrial production and (b) they have instead taken the physical output of a selected few industries. It is from this evidence of a few industries that they have negated the phenomenon of industrial retardation. However, such a view suffers from a fallacy of composition. What is true for the part may not be true for the whole. The allegation gains momentum in view of the fact that CR's selected list of industries (excepting cloth a major item in CR's list of industries showing a decelerating trend) account for only 20.9 per cent of the total weightage assigned to items included in the index of manufacturing and 16.8 per cent of the same in the index of industrial production with base 1980-81 (for details see Appendix). This is not to mean that the index of industrial production is the only meaningful scale to gauge industrial growth (or its absence). However, the lack of any aggregative measure seriously delimits the generality of CR's statistical results.

Moreover if one sees the data on industrial production carefully (index or otherwise) one gets two distinct breaks viz

Period I 1950-51 to 1964-65

Period II 1965-66 to 1979-80

Period III 1980-81 to present date

The first period is characterised by relative growth, the second period by stagnation followed by the third period of further growth. C R's treatment of the whole period from 1961-62 to 1985-86 as one ironed out all fluctuations, the examination of which would have given a better insight into the problem. On the other hand had C R considered the whole period 1950-51 to 1985-86 they would have got still a declining trend for many of the commodities. While they have accepted that 'it is perfectly possible that the trend in the fifties was a sharper industrial growth than during the 24 year period following 1961' in view of the vigour with which they have pursued their results such acceptance is in the nature of lip service.

To exemplify the above point the following evidence may be considered. We have taken GDP on account of industrial activity (in a rather broad sense, viz, covering mining and

quarrying manufacturing electricity generation and water supply and construction) and manufacturing (Y_{ind} and Y_m respectively) at 1980-81 prices and tried to find out the possibility of a structural break in the Y_{ind} and Y_m series. We fitted an equation of the following form

$$\ln(x) = a + bD + ct + eDt,$$

where $x = Y_{ind}$ or Y_m and D is a dummy

variable which takes the value zero for the period 1950-51 to 1964-65, but unity for the period 1965-66 to 1987-88.

Our results are as follows

$$\ln(Y_{ind}) = 8.7254 + 0.2392D + (420.09) (6.07) \\ 0.0655t - 0.0184Dt \\ (28.68) (7.13)$$

$$R^2 = 0.99, DW = 0.5729$$

$$\ln(Y_m) = 8.3813 + 0.1509D + (396.76) (3.77) \\ 0.0651t - 0.0156Dt \\ (28.01) (5.95)$$

$$R^2 = 0.99, DW = 0.6750$$

in view of the fact that in both cases the coefficients of Dt are both negative and significant the hypothesis of a structural break in industrial income is confirmed.

We have the same feeling about the trends of gross fixed capital formation (GFCF). In other words C R neglect the whole of the 1950s and arrive at trends that the earlier authors could not find. But C R's comparison between the rates of growth of GFCF (and its sectoral decompositions) found by a number of economists (given in Table 4 of C R paper) and the same found by them is unacceptable because the time frame for their study was entirely different.

However slow down of gross fixed capital formation is not the only factor responsible for industrial deceleration since the mid sixties. For expository convenience we can cite at least the following oft-referred factors viz (a) income distribution and the demand factor (b) slow down of the agricultural sector (c) slackening of real investment and (d) the industrial policy regime encompassing both domestic and trade policy measures. Out of the list Ahluwalia (1985) has categorically rejected the hypothesis of worsening income distribution over time and slow growth of the agricultural sector as factors inhibiting industrial growth in India. In fact the turnaround of industrial production put forward by C R in statistical terms has already been dogmatised by Ahluwalia (1988). She has observed that the pick up in investment in the infrastructure sectors can be associated with a pick up in the rate of fixed capital formation in the public sector. She has also argued that the recent liberalisations have led to a considerable dilution of the earlier industrial policy regime (e.g., as shown by the turnaround in the numbers of letters of intent since the late seventies). Moreover, the pick up of industrial growth

during the eighties has been shown by a number of economists, e.g., Kelkar and Kumar (1990), Nagraj (1990) and Rangarajan (1990). It is, therefore, hardly surprising that CR have arrived at the conclusion of an industrial acceleration for the period 1961-1985. CR's comment that 'the Cheshire cat seems to have evaporated without leaving behind its famous grin' therefore loses much of its punch.

Finally industrial stagnation (or its lack) is not necessarily a question of quantity, it is a question of composition and quality too. C R's 'simple' statistical findings undermine that—and that is the main lacunae in their whole story.

[This note contains the personal views of the author.]

APPENDIX: WEIGHTING PATTERN OF A FEW SELECTED ITEMS IN 1980-81 IIP

| Item | Weight |
|--|---------|
| Group A | |
| 1 Phosphatic fertiliser | 6 679 |
| 2 Finished steel | 42 933 |
| 3 Pig iron (saleable) | 2 061 |
| 4 Power driven pumps | 3 012 |
| 5 Detergent (including soap) | 6 706 |
| 6 Electric fans | 2 488 |
| 7 Domestic refrigerators | 1 452 |
| 8 Passenger car | 1 402 |
| 9 Sugar | 17 590 |
| Total | 84 327 |
| Group B | |
| 10 Nitrogenous fertiliser | 15 227 |
| 11 Petroleum products | 15 192 |
| 12 Aluminium | 3 364 |
| 13 Sulphuric acid | 4 045 |
| 14 Electric motors | 12 870 |
| Total | 50 700 |
| Group C | |
| 15 Commercial vehicle (buses and trucks) | 3 699 |
| 16 Cement | 15 982 |
| Total | 19 682 |
| Grand Total | 154 709 |

Notes: (1) Items shown in Groups A, B and C are industries which have shown constant decelerating and accelerating trends in C R's paper.

(2) Group B does not include cloth.

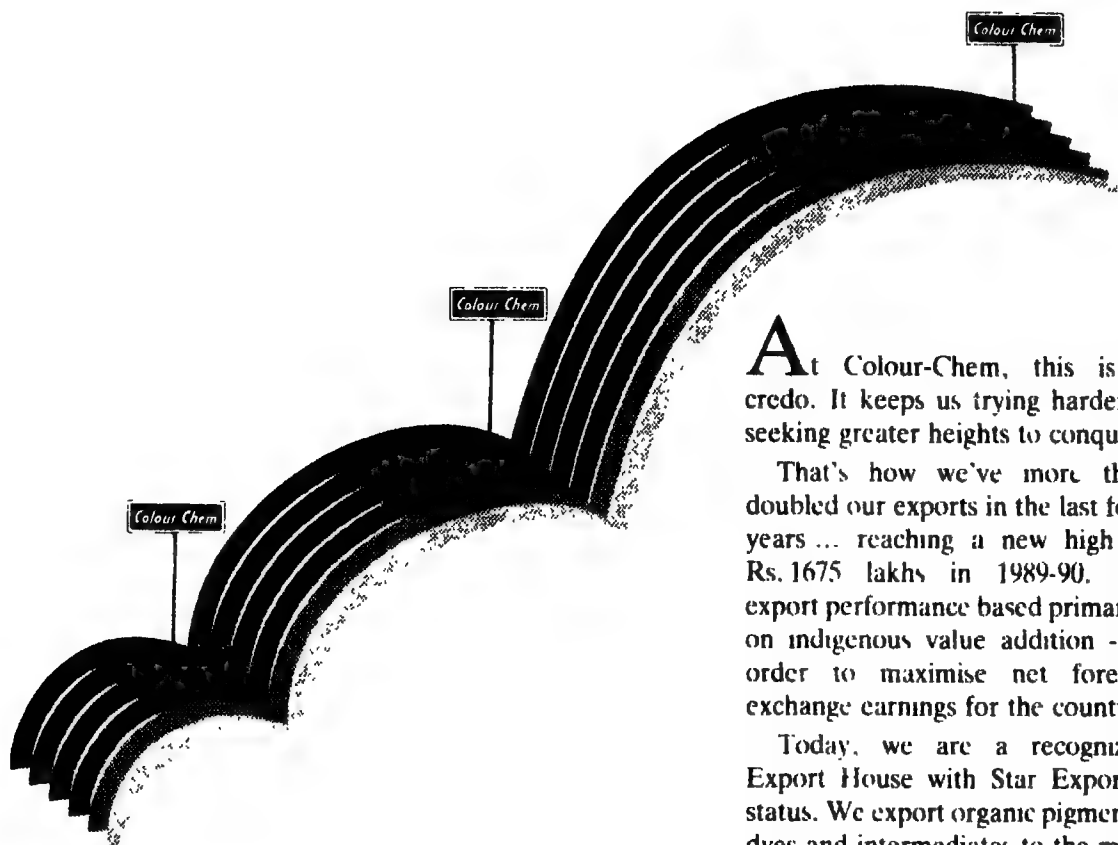

(3) Total weight for manufacturing items in the 1980-81 index is 771 07.

Reaching a new high

At Colour-Chem, this is a credo. It keeps us trying harder... seeking greater heights to conquer.

That's how we've more than doubled our exports in the last four years ... reaching a new high of Rs. 1675 lakhs in 1989-90. An export performance based primarily on indigenous value addition - in order to maximise net foreign exchange earnings for the country

Today, we are a recognized Export House with Star Exporter status. We export organic pigments, dyes and intermediates to the most sophisticated markets in the world — U.S.A., West Germany, U.K. and the Far East. More than 96% of our exports go to General Currency Areas.

Our quest for excellence has also won us awards - eighteen, in two decades.

The quest continues ...

Commodity Markets: Wrong Strategies

The collapse of primary commodity prices, which has severely affected many developing countries, can be partly explained by sluggish demand, but this does not seem a complete explanation. An examination of the evidence supporting the hypothesis that supply factors have been partly responsible

1277

Irrelevance of City Planning

The story of Bombay's second Development Plan offers some clues to the continuing irrelevance of India's urban planners and the product they offer. Some of these clues relate to the process that development plans follow before they acquire legal force, others concern the content of the plans our planners prepare

1289

Price of Editorial Activism

The Press Council's two reports on press coverage of the so called 'kar seva' in Ayodhya in October-November last year have sharply criticised the biased reporting in some newspapers and drawn attention to the issue of 'editorial activism'

1263

Ethnic Tensions

The expression of national and ethnic identities has begun to dominate the political process in Pakistan in a form unknown to the country in the past. An attempt to identify and explain the reasons for the extreme polarisation between Sindhis and Urdu speaking mohajirs

1295

If the contagion of the political upheavals caused by centrifugal forces now convulsing the Soviet Union and Yugoslavia should spread to India, the results would be far worse since the divergence between heartland and borderland and the communal and caste tensions are so much more acute here

1271

Sidelined

The trends in commercial banks' deposits and credit to business and industry in 1990-91 showed the impact of growing financial disintermediation in the economy

1259

Tinkering

The changes proposed in the Maharashtra government's bill to amend the universities acts in the State deal with matters of detail rather than of substance

1258

Fading Anti-Imperialism

During the last half a century changes in the structure of power and the course of international relations have occurred in which the masterly understanding of the strengths and weaknesses of imperialism that the leaders of the great national liberation struggles brought to battle fields and negotiating tables has receded into the background

1267

Established Patterns

The choice of candidates by both the principal contenders in the coming Lok Sabha elections in Andhra Pradesh the Congress(I) and the JDP, reflects the pattern of dominance of different castes in the three regions of the State Rayalaseema Andhra and Telengana

1257

Disputed Symbol

A recent national seminar in Guwahati on Sri Sankaradeva saw a desperate attempt by the Pan Indian cultural establishment to 'Indianise' Sankaradeva, a figure considered by the Assamese people as the quintessential symbol of Assamese nationality

1261

Paying for Liberalisation

There is a reluctance to acknowledge the nexus between the government's embracing, wholesale, the ideology of economic liberalisation in the 1980s and the restrictions the Reserve Bank has now had to clamp on imports of all kinds, including of books, which have outraged so many

1253

Academic Fraud

I WAS most surprised to see the review article on the book *Economics of Perestroika* by A Vyas and A V Vernikov (Ajanta International, Delhi, 1991) which appeared under my name in the *EPW* of April 6. This review article was not written by me and I have not even read the book. When I enquired from the editor of *EPW* he sent me a xerox copy of the covering letter with the article in my name. The signature in that covering letter is not mine and there is no doubt that this is a straight piece of forgery. I am writing this letter because such cases of academic dishonesty and forgery should not go uncontested and unpunished.

AMIT BHADURI

Calcutta

[Our sincere apologies to Professor Amit Bhaduri and our readers for having been taken in by a piece of self-serving forgery—Ed]

Economic Priorities

WITH the elections due next week, it is critical that we sharply define our economic priorities.

The most vital issue confronting the Indian economy is curbing population growth. With a total population of 850 million, which is increasing by about 20 million per annum, our gains in development are being seriously eroded. No government since independence has tackled this problem on a war-footing. During the emergency, arbitrary coercion was used to enforce family planning, contributing to the downfall of the government. Since then, family

planning has become a taboo and politicians are mortally frightened to even talk about it. Controlling our burgeoning population should be a key priority.

The second vital problem confronting our economy is the alleviation of poverty, in the rural and urban areas. Almost 35-40 per cent of the population lives below the poverty line. They live in sub-human conditions in the villages and in slums. Politicians juggle with statistics and poverty lines every year to show how the number of the poor has declined. The fact is that poverty is increasing in the urban and rural areas and close to half the country subsists below internationally accepted nourishment levels.

The third key problem confronting us is mounting unemployment. Even reliable statistics about the total numbers of unemployed are not available. Unemployment among the young breeds bitterness, anger and violence. Self-seeking local politicians exploit these negative feelings to fuel communalism and caste-wars. Alleviating unemployment will necessitate increased investments and production to employ the young. Investments have to be freed from the shackles of licensing and 'permissions'. Anyone who puts up a factory increases production and generates employment. Persons/corporations financing new businesses/expansions from internally accrued funds should be exempted from licence or clearance.

The fourth problem facing us is the ever-worsening balance of payments position. We have to launch a major export drive to earn foreign exchange. It is time we stopped depending on remittances to correct the BOP position. We need to export value-added,

processed and manufactured products to boost foreign exchange earnings. Japan and Korea have shown how even small countries can have exports of sophisticated products like computers, electronics, cars, calculators, etc. We must emulate their example.

The fifth key issue which we need to address is our tardy progress in technology, electronics, computerisation and communications. Even countries like Indonesia and Thailand are leap-frogging in technology and electronics. We have no clear technology policy or mission. We do pay lip-service to these concepts, but are decades behind even Third World countries.

We are unable to focus on specific priorities essentially due to the poor quality of leaders we have had after Nehru and Shastri. Lack of adequate vision and perspective among the leaders has resulted in stunted economic growth.

RAJENDRA K ANEJA

Bombay

For Baliapal!

FOR BALIAPAL, a comprehensive update and information booklet on the situation in Baliapal has just been published. Local people there have for the past four-five years struggled successfully against a National (missile) Test Range to be located here. A number of very good articles and booklets have appeared on Baliapal in the recent past, as has also a film, but mostly in specialist journals or circles. This booklet conceived initially as a complement to the film, *Voices from Baliapal* by Vasudha Joshi and Ranjan Palit, is being published to bring together some of the more interesting material—reprints of earlier articles, a note by the filmmakers, songs by local leaders, interviews, newscippings since 1985, access information, and a reprint of a very informative government document. The purpose is not only to disseminate information but also to encourage direct solidarity with the historic struggle of people who are asking for real development and peace, not destruction and annihilation in the name of development—a question that all states across the world must answer. The booklet is also published in solidarity with the equally momentous rally against destructive development that took place in Harsud, Madhya Pradesh, on September 28, 1989, in which the people of Baliapal and countless other such crisis points from all over the country participated.

The book is priced at Rs 40 each (for a single copy order) and Rs 25 each for multiple copies. Please write to the address below for further information.

Different Script

WHATEVER its outcome, the election to the tenth Lok Sabha has already seen some significant departures from the script handed down from past elections. This is all the more noteworthy since, in many ways, the political developments beginning with the Congress Party's defeat in the 1989 election bear quite a close resemblance to the events of 1977-79 which saw the short-lived Janata Party government and the triumphant return to power of the Congress after a gap of a mere two years. This time round too the collapse of the National Front government and the splintering of the anti-Congress electoral alliance of 1989 should have made for a relatively easy passage for the Congress in next week's election. But that is not how things seem to have worked out.

The basic difference this time has been that, despite the political instability, the Congress, try as it might, has failed to set the political agenda for the election. Unlike in 1979, this election is not being fought primarily over the Congress's claims of saving the country from political turmoil and providing a stable government. The election has instead been dominated, over large parts of the country at any rate, by two other overarching issues: the BJP's appeal to the religious and communal sentiments of the Hindus—specifically over the building of the Ram temple in Ayodhya as well as more generally over the alleged pampering of the minorities, the alleged demotion of Hindus to the status of second class citizens etc., and, second, the Janata Dal's proclaimed commitment to the cause of social justice, more particularly for the backward castes. From all accounts, the impact of these issues on the electorate, in the northern and western parts of the country especially, has been profound enough to largely offset the consequences of the split of the anti-Congress vote which should otherwise have enabled the Congress to sweep the poll in the northern States, as it had done in 1979 in similar circumstances, and win a comfortable majority in the new Lok Sabha despite the inevitable loss of some ground in the four southern States as compared to its superlative performance there in 1989.

When the BJP had won 86 Lok Sabha seats in the 1989 election, that was attributed largely to the anti-Congress electoral alliance with the National Front. But this time, fighting the election on its own—of course, with the full support of the storm troopers of the RSS, the VHP and the Bajrang Dal—reports indicate that the party has extended its grassroot support beyond the (largely urban) trading communities to make serious dents into the Congress hold over the upper castes and even the Janata Dal's support among the Jats. The BJP challenge has evidently become so palpable that the Congress is holding up the threat of a BJP victory to try to win back the Muslim votes it had lost in 1989. As for the Janata Dal, while the appeal of V P Singh's campaign for social justice has been undeniable, largely for reasons which have to do with the internal organisation of the party, the electoral impact of the issues raised by it is expected to be most effective in Bihar and UP. In these two States, and

to varying degrees elsewhere, the Janata Dal has appropriated the backward caste and scheduled caste support bases of the Congress.

While the apparent growth of BJP influence has been linked to the mobilisation over the Ram Janmabhoomi issue and last year's 'rath yatra' of L K Advani, the rapidity with which this has occurred has been possible only because of the existence of a hospitable environment, the creation of which has not been the work of the BJP alone. The other parties have contributed to it through acts of commission and omission. Most culpable, of course, is the Congress with its thinly veiled appeals, as in the 1984 election after Indira Gandhi's assassination, to Hindu chauvinism in the name of nationalism or its more blatant attempts to take the wind out of the BJP's sails by opening the Babri mosque for worship by Hindus in 1986 and permitting the foundation laying ceremony for the Ram temple in Ayodhya on the eve of the 1989 elections. The Congress must also take the blame for sowing the seeds of the secessionist movements in Punjab and Kashmir, which have since come in handy for the BJP in stoking Hindu fears and insecurities. The elite-oriented economic and social policies of Congress governments at the Centre in the eighties, leading to widening inequalities, worsening unemployment and rising prices, have produced a general sense of alienation, frustration and disillusionment which now the BJP is aggressively offering to cure through 'Ramrajya'. The other parties, including the Left parties, have by and large failed to mobilise the people against the Congress's socio-economic policies and programmes and to present a perspective on issues such as Punjab and Kashmir significantly different from that of the Congress. If the outcome of next week's election does indeed show a notable rise in the mass appeal of the BJP, the responsibility for that will thus have to be widely shared.

So close to the election, it is but natural that there should be a general feeling that its outcome will be all-important and decisive, calling for the preparation of contingency plans and justifying possible changes, of course. The impression of the significantly enhanced influence of the BJP has led to unsolicited advice being directed to the Left parties beseeching them to abandon their opposition to the Congress in the interest of thwarting the BJP. However, fortunately or unfortunately, none of the possible outcomes of the election is likely to warrant overly alarmist or euphoric reactions. Just as the conditions which have made possible the growth of the BJP's influence have been created by a wide range of political forces and socio-economic developments over a period of time, similarly arresting it is unlikely to be achieved by knee-jerk responses. The anti-communal cause will certainly not be served by rushing into the Congress's arms and lending support to its perverse economic policies, its authoritarianism, its drive for political and administrative centralisation or its aggressive national chauvinist attitude towards expressions of ethnic and regional disaffection.

BUDGET DEFICIT Cutting Corners

WHILE the proposal to disinvest up to 20 per cent of government equity in selected public sector units was widely interpreted as a first step towards the privatisation of public enterprises, quite a few observers were quick to note that it was "essentially an accountancy game" to reduce the fiscal deficit and bring it as close as possible to the target of 6.5 per cent committed in the government's negotiations with the IMF. In fact, fear was expressed in some quarters, and not without justification, that this measure might as well pre-empt 'institutional funds' so as to provide 'budgetary support' and might therefore 'affect both stock market prices and investment by the financial institutions and mutual funds in new projects and share issues'. Now that it has been disclosed that contributions to the various approved mutual fund schemes during 1990-91 have fallen far short of the level they were expected to reach, it is possible that the financial institutions will have to be depended upon to a much greater extent than was originally expected if the target of Rs 2,500 crore set in the Centre's interim budget for the disinvestment of government equity in public sector units in 1991-92 is to be achieved. So the fear of diversion of funds in support of the budget may prove to be quite well founded.

However, even if the mutual funds and financial institutions were to be in a position to raise substantial additional funds to finance the proposed disinvestment, the point about the manner of accounting of the receipts is far more important than a matter of mere accountancy. What is proposed is that the proceeds of disinvestment are to be deemed as being in the nature of budgetary receipts that will go to reduce the fiscal deficit. Not that the concept of fiscal deficit is a particularly meaningful one, certainly not insofar as macro-economic analysis goes. But it is important to note that these receipts are not regarded as capital receipts. The underlying assumption apparently is that these receipts are in the nature of revenue account receipts—or very close to being so. But are they?

According to the budget speech the proposed disinvestment is to be "in favour of mutual funds and financial or investment institutions in the public sector". As far as mutual funds are concerned their source of funds is deposits made under section 80 CCB of the Income Tax Act. Now, these deposits are practically in every sense, similar to deposits under the National Savings Scheme covered by a like provision viz, 80 CCA, of the same act, but these latter deposits are shown as capital receipts in the Central budget. How come, then, that deposits made with mutual funds and canalised to the govern-

ment in purchase of government equity in public sector units become revenue receipts or very close to them? As regards purchase of equity by other financial institutions whose source of funding is largely borrowing of various types, to consider these funds as other than such when they reach the budget is even more arguable.

Of course there are strong analytical grounds to distinguish budgetary receipts in the form of small savings from market borrowings. In fact, for the calculation of the so-called 'fiscal deficit', as christened by the IMF, small saving receipts of the government should not have been clubbed with other forms of government borrowing, certainly not with credit to government from the Reserve Bank. But, evidently not rationality but Fund dictums now define these concepts and lay down the rules. Or will the finance minister in the new government be able to take a more independent line?

FLECTIONS

Toothless Law

THE setting aside by the Bombay high court of the elections of two Shiv Sena MLAs and one Shiv Sena MP from Bombay and a BJP MLA from Aurangabad on grounds of corrupt practices under Section 123(3) and (3A) of the Representation of the People Act (RPA) serves paradoxically to emphasise the ineffectiveness of these provisions. Section 123(3) deals with seeking votes on the ground of religion and Section 123(3A) with promoting enmity between people.

For one thing, these provisions come into operation only when a notification of election is made. Consequently the same activities which these provisions delegitimise may be practised with impunity until the act itself becomes operative. This raises a problem that is peculiar to the processes of ideological mobilisation whose effects are not contained within limited time frames. Ideological conditioning is often self-regenerative and its reproduction continuous and a law intervening only at a particular stage cannot presume to arrest its momentum. In this respect the law is inadequate since it obviously proceeds from assumptions which disregard sentiments cultivated before the notification of elections. Consequently communal acts by the BJP like the 'rath yatra' went unnoticed by the law.

The futility of the act and hence any judgment based on it proceeds also from its inability to recognise an organic link between non-political communal organisations and the candidates for whom they canvass support. The concerned law in fact is such that the separability of corrupt practices from the candidate is established with ease. Thus the BJP can

press into service organised hordes of sadhus and sadhvis in a well-orchestrated campaign involving corrupt practices. The Imam of Jama Masjid can issue a 'fatwa' on the political preference that Muslims should exercise. The link between the communal appeal and the political end is clear but the law is unable to comprehend it as such.

The futility of the law as it stands is underlined by its operation in the past. In 1975 the supreme court had upheld a Bombay high court ruling setting aside the election of a Muslim League candidate Ziauddin Burhanuddin Bukhari who defeated Shaikat Currimbhoy Chagla in the Kumbharwada constituency in 1972. Justices M H Beg, A Alagiriswami and N L Untwalia were of the view that the winner had elicited votes through communal appeals. The futility of that ruling is only confirmed by the fact that 15 years on the courts have had to set aside the election of four legislators. That more were not set aside has less to do with proper conduct of political parties and more to do with the absence of petitions against them.

POLL VIOLENCE

High Stakes

THE recent hullabaloo over the law and order situation in Bihar is a little comical, to say the least. This is not to say that there is no law and order problem in the State. There certainly is, since according to a newspaper report, after the poll campaign got going, 10 lives had been lost up to May 9 in 22 major incidents connected with the electoral contests. The point is, is there anything abnormal in these figures? Can any power on earth ensure totally 'incident-free' polls in Bihar today? Since the obvious answer to both these questions is an emphatic 'no', the flutter in New Delhi dovescots over the situation in Bihar has to be regarded as stage-managed over reactions with an eye to gaining some tactical advantages on the part of the Congress(I) and the BJP vis-à-vis the Janata Dal government in Bihar. Things being as they are, if, and to the extent, the Election Commission directly or indirectly lends its stamp to boost the obviously manipulative outcry, it will certainly not add to its credibility as an impartial overseer of the national polls.

All this is not to exonerate the Bihar government. The fact is that the government and the party behind it are involved in the north Indian practice of winning elections by 'bandookbaji' as much as any other party—that is, neither more, nor less. Reams have been written and reels have been shot to expose this culture in the newspapers, TV and so on. Indeed, while shouting the loudest about the Bihar situation, the BJP itself has moved one step ahead in the same game in the

neighbouring Uttar Pradesh, where going beyond faceless, anonymous gun-toters, it has brought in notorious ex dacoits. It has directly fielded against the Samajwadi Janata Party chief minister Mulayam Singh, the former dacoit leader, Tehsildar Singh, son of the late dacoit chief Man Singh. According to press reports, a number of other figures from the ravines of the UP MP region have joined the fray on different sides.

Newspapers are replete these days with reports about the flourishing arms-bazaar in Bihar. Violence of this new style in this State had started over two decades ago with the offensives of the landowning classes against the rising resistance of the scheduled castes and scheduled tribes against the former's 'zooloomshahi' over the latter. Both the 'zooloom' and the violence backing it still continue, but pass largely unnoticed by the establishment, press and politicians. Since political and social culture has a tendency to be pervasive, violence which was earlier reserved for the landowners' defence of their power *vis a vis* the underdogs has now become the modality of their sharing of power among themselves. From the weapon of inter-class war, guns have today become the instruments of intra class conflicts.

What can the Election Commission do under these circumstances about controlling violence in the elections unless and until the chief players are agreeable to changing the real rules of the power game? The elaborate and ornate codes of conduct decreed by the commission are really irrelevant to the real contest for power when the stakes are too high for the players to be bound down by any pledge to be non violent.

FUND BANK MEETING Pointless Exercise

THE half yearly Bank Fund meeting this spring was particularly disheartening for the Third World. The developed countries showed little concern for the issues and matters that exercised the less developed member countries of these organisations. Indeed there were indications of not just weariness with Third World protestations but of actual hostility to their concerns. The question which cannot long be swept under the carpet is whether such frequent meetings and at such a senior level, namely, of finance ministers, serve much purpose.

After all, given the clout that the developed member countries of these organisations enjoy and the approach they have advocated to the payments and other problems of the less developed countries, namely, of case by case resolution, particularly in the context of the debt overhang, meetings of a general nature tend to lose their usefulness. As a consequence,

little headway could be made on the question of a fresh SDR allocation, something that the less developed countries have cried themselves hoarse about, with the support of even some developed countries, especially France. But the Anglo US opposition has been hard to crack.

Interestingly, at the meetings just concluded, not only were the less developed countries lectured to about the virtues of opening up their economies further, but they were urged to do so without any promise of payments support. These countries were also sermonised about the need to contain military spending. Barber Conable, the outgoing World Bank president, was quite assertive in this regard. "We reserve the right to talk to countries about military spending. It is a legitimate concern."

Of course excessive military spending should be a matter of concern and not just to the organisations which are in the business of lending to the less developed countries. But is this something new? Excessive military spending by less developed countries has often in the past been underwritten by the developed countries, individually as well as collectively, and organisations like the Bank and Fund have knowingly overlooked it. In fact it would be possible to sort out most, if not all, of intra Third World disputes fairly fast if only the developed countries were to accept a self denying ordinance against all military assistance and arms export to the less developed countries. Instead, if pressure is put only on the latter to reallocate their budgetary expenditures, the result may be nothing more than mere window dressing with no real cuts in military spending unconscionably high though such spending is today in the Third World.

RELIGIOUS BELIEFS More Important than Lives?

CERTAIN allegedly derogatory remarks made by a well known journalist against Shivaji in the course of some discussion as reported in a New Delhi fortnightly has roused the Shiv Sena controlled Bombay Municipal Corporation to a murderous frenzy, with one corporator swearing to despatch Singh to the hospital if he dared to land in Bombay. Even though the BJP Shiv Sena combine has not yet come to power at the Centre (which is their dream), everyone seems to be overawed by their threats.

What is involved in the entire unseemly controversy is something more important than some careless utterances of a journalist. Such utterances would have been ignored in a normal environment. But during the last few years, the social environment has been sought to be vitiated

by establishment independent fundamentalism that is determined to thwart all attempts at scientific inquiry and revaluation of past history through such inquiry. Any unearthing of historical evidence that may disprove myths about gods and prophets, heroes and leaders who are worshipped by their respective religious followers is immediately condemned by these fanatics as acts 'causing insult to religious beliefs'. To the long list of sacred cows like Rama, Sita, Mohamad are now added figures from recent history like Shivaji, Rana Pratap, who are sought to be protected from historical revaluation and reasonable criticism. Maybe, in another few years' time the list will include Advani, Vajpayee, Bal Thackeray, the Shahi Imam and the numerous godmen and charlatans who are worshipped by their respective followers. Nothing can be said against them, since it may cause 'insult to the religious beliefs' of their followers.

The catch all phrase 'insult to religious beliefs' can quite often be used to discourage any scientific inquiry into the origins of religious beliefs which may be proved to be obscurantist, irrelevant or even anti humanist. Should historians, who have to distinguish between facts and myths while studying social history, stop their research at a point where their findings may 'insult the religious beliefs' of certain communities? That such pressure can be brought upon scholars was evident from the Gujarat government's prosecution of three research scholars in 1988 for their paper which challenged the beliefs prevalent among the Swaminarayan sect by suggesting that the deity it worshipped was not a god, but could have been a human being.

Like the Gujarat government in 1988, the BJP Shiv Sena critics today in order to bolster their right to immunise their religious and historical heroes against any scientific analysis, are trying to fall back on the ill worded provisions of a colonial legislation. Section 295-A of the Indian Penal Code of 1860 (which still operates) provides punishment for one who "by words either spoken or written insults or attempts to insult the religion or the religious beliefs of that class (i.e., any class of citizens of India)". It was under this section that the Gujarat government pro-

Notice to Readers

The Annual Number is under print and will be posted to readers as soon as it is ready. Because of the Annual there were no weekly issues on March 16 and 23, 1991, which subscribers are requested to please note.

May 11, 1991

It is obvious that the section needs to be amended in the light of the constitutional obligation (under Part IV A of Fundamental Duties) to "develop the scientific temper, humanism and the spirit of inquiry and reform". In pursuance of this duty, one may have to question the validity of many religious beliefs and practices. Such questioning or attempts at objective appraisals of historical figures (belonging to any religious community) should not be surely equated with communal discrimination against and aggressive attacks on members of that religious community. The existing laws provide enough scope for punishment for such acts. Curiously enough, both the politicians and the administrators are vociferous more against cases of 'insult to religious beliefs' than against killings of members of one religious community by another. Beliefs, however irrelevant and obscurantist they may be, are apparently more important than human lives.

SMALL SAVINGS

Accounting Games

IN the context of the proposal to set up the Bharat Bachat Bank, it is worthwhile recalling the observations made by the finance minister while presenting the interim budget. The so-called fiscal deficit, he said, had tended to get enlarged because of the buoyancy in collections under small savings schemes which had to be shared with the States in the form of additional loans. To quote from the budget speech: "The increase in the fiscal deficit is, to some extent, beyond the control of the government due to the autonomous buoyancy in small savings collections, as a result of which the provision for loans to State governments has gone up by Rs 2,270 crore in the revised estimates. Were it not for this factor, the fiscal deficit, now estimated at 8.59 per cent of GDP, would have been 8.14 per cent of GDP."

This, to say the least, is very strange logic. If small savings were buoyant, the benefit goes to both the Centre and the States and not just to the States. So how come that the fact of having to give additional funds to the States creates a larger deficit? In this particular case, if the States' share is estimated to have gone up by Rs 2,270 crore the Centre's share too would go up by at least Rs 760 crore. The problem evidently lies with the way the fiscal deficit is defined wherein the outgo to the States in the form of their share of small savings collections is shown but not the gross collections.

A partial solution of the problem is sought by the proposed establishment of the Bharat Bachat Bank and the transfer to it of the National Saving Scheme. It is only a partial solution because still a

major part of the small savings collections will pass through the government budget. Why did not the finance minister consider transferring all small savings to the proposed Bharat Bachat Bank? With one stroke of pen, the so-called fiscal deficit could have been reduced by a further Rs 4,500 crore in 1991-92. As a proportion of GDP, the deficit would have been brought down to less than 6 per cent. One cannot put it beyond the subalterns in the finance ministry that they are holding this in reserve in their bag of tricks for the forthcoming regular budget.

However, whatever accounting games the finance ministry may have up its sleeves in order to satisfy the requirement of the IMF, the States have to be on their guard. Thus, while the interim budget makes a reduced provision for transfers to the States on account of loans against small savings collections, there is no indication at all of the share they would receive of the collections under the National Saving Scheme to be transferred to the Bharat Bachat Bank. A number of State finance ministers are known to have already voiced their concern on this score, publicly and in interactions with the Planning Commission as well as the finance ministry. But the outcome is not yet clear. Perhaps this is a fit subject for the States to raise at the meeting of the National Development Council when it is convened after the finalisation of the new Central government.

SOVIET UNION

Serving Notice?

WHAT message is Mikhail Gorbachev trying to send? And who does he have principally in mind? At the joint press conferences with French president Francois Mitterrand, Gorbachev is reported to have said: "We should all proceed with the premise that the Soviet Union does exist; that it will continue to exist; that it is a powerful State and it will continue that way."

Gorbachev acknowledged that the Soviet Union is passing through a crisis, that his perestroika is caught "in extremely adverse weather, in a storm", while "the instruments are out of order and the crew is not as united as it should be". But, he asserted, "we must pass through it".

It is known that Gorbachev is facing deep, serious domestic problems, both political and economic. At the same time, he has lately met with some measure of success in the resolution of some of these problems. At the political level, he was able to carry along with him nine out of the 15 republics. These nine republics account for over 90 per cent of the Soviet population. At the economic level, the withdrawal of the two-month old strike by miners, though achieved only after a major concession, is still a matter of relief.

It is on the international plane that the Soviet Union possibly finds itself outmanoeuvred and by none other than the US, the country it has been going out of the way to befriend. Over disarmament, nuclear as well as non-nuclear, Soviet Union has given way on issues much, much beyond US expectations. On Eastern Europe, again, the Soviet withdrawal has caught its adversaries totally by surprise, in regard to both its scale and speed. And in the Gulf, Soviet acquiescence practically in every action of the US was so total that not only the Arab world but the whole of the Third World possibly was driven to the conclusion that the Soviet Union had forsaken its role as one of the two superpowers, whatever its compulsions, and that therefore the world would hereafter have to contend with a uni-polar international setting.

Is Gorbachev now suggesting that the Soviet Union is not for forsaking its superpower role? Or is his assertion that Soviet Union is still a powerful state meant only to remind the US and its allies, including Japan, that they have defaulted on the promises and understandings, admittedly informal, on the basis of which Gorbachev had made the various concessions on different fronts? It is not totally irrelevant in this context that Gorbachev's recent visit to Japan, the first in history by a Soviet president, proved to be totally unrewarding, that the Soviet application for Bank-Fund membership has been rejected outright, that the Soviet request for Western credits has been turned down by the Joint Fund-Bank-OECD Study Group which has only recommended technical aid to switch to a free enterprise economy. Large-scale aid, the group says, has to be withheld until and unless the "Soviet Union is prepared to abandon socialism totally and move over to a free market system, not in gradual steps but in a total reversal". Evidently, Gorbachev is serving notice that he is being pushed beyond the point of tolerance.

SRI LANKA

Mirror Images

A Correspondent writes:

A RECENT visit to Colombo brought home to this correspondent the politics of the grotesque that Sri Lanka shares with India. The staple of daily conversation and newspaper reports centres around the same topics—'terrorism', 'encounter deaths', 'disappearances' and 'bomb explosions'—and when these become too boring, the staple shifts to such speculative subjects as 'negotiations' and 'elections'. The names of the places are interchangeable. It would make little difference if one replaces Amritsar with Jaffna, or Vauninia with Raramula or Tamiliana

with Sikhs, or Sinhalese with Hindus. The gruesome happenings at the ground level and the political manoeuvres at the top level follow the same pattern.

The ding-dong battle goes on in the north and the east, with Sri Lankan forces bombing Tamil villages and killing civilians and the LTTE raining mortars on military camps and naval bases. The people of Jaffna are victims of carpet bombings by the Sri Lankan air force and of an economic strangulation imposed by Colombo which refuses entry of groceries and essential commodities into the villages. The LTTE fleeing the army offensive often descends on the bordering Sinhalese villages in the east, and hacks innocent and unarmed Sinhalese, who in retaliation kill their Tamil neighbours. Communal relations in the east with its traditional ethnic mix are in jeopardy as evident from the massacre of 22 villagers at Niyadella on April 21, followed by a reprisal at Moneragala four days later. The LTTE claims that it is in control of the northern tip of the island spreading from Jaffna on the top to Mannar in the west and Mullaitivu in the east and that the war has entered the final phase. Reports reaching Colombo from Jaffna suggest that the LTTE operates from the jungles and takes over the villages in the night. But unlike a politically committed people's army (which emerged during the liberation wars in China and Vietnam), the LTTE still remains primarily a militarist outfit motivated by purely chauvinistic passions and centred around the charismatic personality of Prabhakaran. Its intolerance of other Tamil militants and the brutalised proclivities of its ranks have been directed against Tamil citizens in the north also. This comes out clearly in a meticulously documented report prepared by the Tamil intellectuals of the north brought together under the organisation called the University Teachers for Human Rights. The report describes vividly the plight of the average Tamil, caught in the crossfire between the trigger-happy Sri Lankan army and the marauding Tigers. But at the same time, one should understand the psychology of the entrapped Tamil citizen in the north. As one observer graphically put it: "Everytime he looks up at the skies watching in fear the Sri Lankan air force bombers hovering over his village, he draws courage from the knowledge that the Tigers are somewhere around to wreak vengeance on the bombers in retaliation against the carpet bombing." For him, the LTTE fighters are 'our boys'—the term used by the Tamils of the north (the same term, curiously enough, in current use among Punjab's Sikh citizens to describe the Khalistani militants). There seems to be a general

feeling of dependence reinforced by helplessness—both in Jaffna and the Punjab villages (which this correspondent visited some time ago)—among the common people who deep down may often be repelled by the repugnant behaviour of 'our boys', or even be harassed by them, but would prefer them to what they perceive as the occupation forces of Colombo in Jaffna, and of New Delhi in Punjab and Kashmir. In the absence of a liberation movement led by socialist and democratic forces, with a concrete programme inviting popular participation in a socio-economic change, the people of Jaffna, Kashmir and Punjab are left at the mercy of either chauvinistic forces or religious fundamentalists who at gun-point command their loyalty to objectives which are meant to ensure the ascendancy of petty elites—the Tamil Tigers, the obscurantist clergy in Kashmir and Punjab in alliance with gun-toting local gangsters masquerading as 'liberation fighters'. The popular aspiration for liberation gets lost in the ruthless military adventure indulged in by the unscrupulous, fanatic forces which have taken over the territory of both ideological discourse and operative programme.

Meanwhile, in Sri Lanka, both the government and the LTTE are making bids for mediation, dictated of course by their respective calculations. It is this which brings out the phoney nature of the bloody war in all its ugliness. On the one side, president Premadasa is seeking a negotiated settlement in the north with the non-LTTE Tamil militant groups like the PLOTE (which incidentally is fighting the LTTE in alliance with the Sri Lankan armed forces). With the LTTE gaining military advantage, these groups are keen on preventing the LTTE from coming to power in the north and the east. Premadasa, while ready to accept the mediation of some third force like Australia or the SAARC in possible negotiations with the LTTE, is averse to any Indian intervention. On the other side, the LTTE which only some time ago was locked in a fierce confrontation with the IPKF, is now seeking India's help again. Kasi Anandan, an LTTE leader recently in Madras described the previous confrontation between his organisation and the IPKF as "an unfortunate chapter" which should be "totally forgotten by both sides", adding "we want to be on the side of India and we also want India to be on our side". Tamil leaders both in Sri Lanka and Tamil Nadu are keen that India should revive its role in Sri Lanka. Whoever comes to occupy the seat of power in New Delhi after the coming elections will be under pressure to reanimate a policy that was allowed to slumber during the last two years.

TWENTY YEARS AGO

EPW, May 15, 1971

One of the first major acts of the new Central government returned to power with an unassailable majority in parliament, has been to revive its powers of detention without trial. This, incidentally, was not one of the items of the Congress Party's 10-point programme. The Maintenance of Internal Security Ordinance issued on May 7 gives the government powers of arbitrary detention identical with those it enjoyed under the Preventive Detention Act, which it had allowed to lapse last year to buy the support of the leftist parties. As under the Preventive Detention Act, the ordinance empowers the Central and State governments to arrest any citizen and hold him without trial for as long as a year. The only formality required to be fulfilled is a review by a government-appointed advisory board. Even after the expiry of a year, there is nothing to prevent the government from re-arresting the person—and so on indefinitely, if necessary.

Why has the government been in such a hurry to arm itself with these powers? Leaders of some opposition parties have expressed the fear that the powers would be used against the government's political opponents. But which political opponents? Surely, not those in the organised political parties which were so completely routed in the elections that it is ridiculous to imagine that the government would be in such haste to assume extraordinary powers against them? No, it is not a threat from these parties that the government is providing against—not primarily at any rate. Evidently, the example of the armed insurrection by the Janata Vimukthi Peramuna against the Bandaranaike government in Ceylon (in suppressing which our armed forces have played a good neighbourly role) has not been lost on the government of India. It seems determined not to repeat the mistake of the Ceylon government in underestimating the threat posed by the JVP. But what is significant is that, for all the brave talk of removing poverty and achieving social justice, the government appears to be proceeding on the assumption that the discontent among certain sections of the people, which already expresses itself in armed violence in some parts of the country, will progressively get aggravated. Nor can it be honestly maintained that this assumption is invalid, judging by such indications as one has of the government's intentions and capabilities in the direction of achieving a reasonable rate of economic growth and equitable distribution of the fruits of growth.

Calcutta Diary

AM

Few are prepared to acknowledge the nexus between the nation's embracing, wholesale, the ideology of economic liberalism in the roaring nineteen-eighties and the restrictions the Reserve Bank has now had to clamp on imports of all kinds, including of books, which have outraged so many.

A LETTER from Mrinalini Sarabhai to newspaper editors, full of, as they say, anger and anguish. The Reserve Bank of India has, in her view, done an outrageous thing by clamping the kind of restrictions it has clamped on the import of books. Books are synonymous with enlightenment. They hint of joy and pleasures which lift existence on to a superior plane. Life will not be worth living in case import of copies of the latest Gabriel Marquez or of the latest issue of *Granta* becomes impossible because of the preconditions imposed by the country's central bank. Leave out literature, what about the crucial areas of mathematical speculation and technology; till as long as the Reserve Bank fiat continues, our new generation will be deprived of the opportunity to be acquainted, on an instant basis, with developments in, for instance, molecular biology and computer science. The Reserve Bank's decision, Mrinalini Sarabhai does not have the least doubt, is a cruel blow against civilisation.

And yet few, very few, including Mrinalini Sarabhai herself, will be prepared to acknowledge the nexus between the nation's embracing, wholesale, the ideology of economic liberalism and its current inability to buy books freely from overseas. Had our policy formulators, kibitzed at one end by the domestic industrial and trade lobby and at the other by foreign credit-giving institutions, not gone on the wild, wild import spree in the roaring nineteen-eighties, there would have been today no exchange crunch and no external debt trap; books would have therefore continued to come in. But those who mattered, influenced as much by Margaret Thatcher as by perestroika, preferred to go on a liberal binge. The outcome is the present immiserisation and the symbiosis between India and the begging bowl. We can now afford to indulge in neither Marquez nor Otcenasek, nor Kundera or Havel. Also consider the irony of it. Since there are going to be no books to read, time will be free, time to decide on the organic link between misguided economic policy and booklessness. Or, shall we say, between sin and culpability? The recently interred Graham Greene would perhaps have expressed it in yet another form, as the dialectics of

sin and atonement.

We have stumbled on a familiar facet of human civilisation. Take into account, for instance, the unending *ex post* commiseration, in the month since Greene's death, with the moral dilemma he had lived with. Is not much of this compounding a huge hypocrisy? It is safe, safe beyond measure; Greene is dead and gone, he is incapable of causing any further social embarrassment, the incongruities and contradictions in human behaviour will no longer be tauntingly commented upon. The cynic and the believer, after all, chose to co-colonise Graham Greene's soul: a man is born to sin, there are, he seemed always to be saying, no ways of escape, the social factor, such as lealty to wife, husband, mistress, paramour, child, friend, comrade, is fraught with insignificance, attachment cannot but lead to abandonment, passion is betrayal. The deception one is fated to commit is nonetheless a self-contained exorcism; it is betrayal, therefore it is perdition, however it is, simultaneously, atonement as well, death is life, life is death.

Greene wore no blinkers, he perceived social repression for what it was and is, a casualty of causality. The sardonic eye ever remained the sardonic eye, whether while detailing the genuflections of our man in Havana, or travelling with the formidable aunt, or befriending the ambivalent central American generals. He freely mixed facts with fiction, for he had in the meantime caught on to the essence of the matter, are not long-winding facts stranger than fiction, for example, imperialism is dead, long live imperialism, colonialism is defunct, colonialism is what provides the clue to the principal goings-on in the dark nooks and recesses of the world? The United Nations Economic and Social Council, the United Nations Conference on Trade and Development, agencies and affiliates of the World Bank acclimatise themselves into spending pots and pots of money to commission global economic assistance models; the ostensive purpose is to provide succour to so-called Third World countries. They could have saved themselves the bother. For years on end, despite the elegant models and the equally elegant speeches backing them up at international forums, the Third World

has in the net been exporting capital to the rich Western countries. Whether you choose to ignore the particular context or not, it is once more a vindication of Greene: the more you concern yourself with the agony of atonement—or pretend to do so—the greater is the accumulation of sin, the atonement itself assumes the form of sin. Back and forth, back and forth, it is the same old frightening tale, from *Brighton Rock* onwards, but you hardly dare to call it stale. The deadly allure of the confessional box, and yet, the irrelevance of it. Father, I have sinned. But the Father himself has sinned, he is a sinner, a co-victim, or, have it your way, a co-conspirator. So who will grant absolution to whom? Each one is a burnt-out case, including the doctor dispensing treatment and assurance. Faithfulness is the most fragile of human relationships, loyalty is decent, trust is treachery, and yet, as that other convert to Roman Catholicism loved to put it, in our beginning is our end, each time we return to faith, knowing full well that, between faith and the absence of it, the chasm simply does not exist, the loser takes all, because, definitions be damned, the loser is the victor, nothing is more vacuous than drawing a line between triumph and defeat, there can be, after all, no avoidance of the final fate, one seeks escape in order to ensure entrapment; that is, once more, the social factor at work.

In spite of the doggedness of faith, it is therefore the eternal hour of the cynic. The determinism in canonical prescriptions is a dead-end; they are by no stretch even brave statements of nihilism, they are much too enervated for that. The other determinism, what socialist doctrines glorify and deify, has a similar message to transmit; such doctrines too both attract and repel. That at least was Greene's judgment. The dialectical analysis of the historical reality in Marxism, Greene would grant, is impeccable, the pain and sufferings inflicted on peoples are, invariably, the handiwork of other peoples, or of institutions manned by peoples. Sometimes the *deus ex machina* of oppression is the church itself, as in Haiti; cross over to Nicaragua though, the church dons the mantle of the liberator, the sin shades off into atonement. So why desert a dilemma one knows so well for the dogma of a parallel moral principle, which states explicitly that man the individual can be liberated only by the creativity of man the collective? It may be logically highly satisfying, shuffling affiliations is still a bit like shuffling heresies. Besides, what is a heresy? Between affiliation and heresy the shadow does not fall, in a given context, religion itself, contradicting as it does the tenets of one, is heresy, or, turn the premise round, heresy itself is religion. The moral

fabric is amoral, for the amorality liberates lost souls. That claim, it will be immediately said, is an unpardonable exaggeration. Could there actually be any liberation for lost souls, would not they gravitate toward other lost souls alone? Or would they not contaminate the hitherto innocent ones, rendering them into apparitions without the least hope of redemption. Greene, will you not please agree, shades off into Dostoyevsky.

The sublime is banal and the ludicrous treads the same path as is preferred by the holiest of the holy. It is no tongue in cheek beseeching of coincidence, Graham Greene's epistemology of non redemption and Mrinalini Sarabhai's lament over what the Reserve Bank has done to our world of books have common coordinates. An individual as much as a nation are accountable for their decisions and non decisions, dare to defy the causal connection between deeds and their consequences, you will get even more messily entangled in the moral net. The social set Mrinalini Sarabhai belongs to had for long years bayed and bayed for liberalisation. The government they owned, the government which belonged to them could not be more ingratiating, it granted them all their demands. The result is the current mess, culminating in the desperate hurry to clamp restrictions on the availment of the Open General Licence. Mrinalini Sarabhai felt impelled to write to the newspapers, she should however have really addressed herself to her clansmen, the bourgeoisie in Bombay and Ahmedabad. Some of the latter breed continue to talk tough, or at least feign to do so, they are not willing to give up, they pin their faith on the International Monetary Fund. Father, we have not sinned, it is always the others to blame, the counter point of the social factor does not worry them yet. That too is however fate, which is in fact historicity. Revolutions, it is assumed by the entrenched ones, always happen in the neighbour's territory, their own domain is bound to escape the contamination, and for reasons either aforesaid or following. The revolution, when it comes, nonetheless brushes aside the King Canutes, it rushes headlong and catches the dogma mongers napping. The International Monetary Fund route will bring much unhappiness, and, who knows, perhaps not just to the poor, there is no knowing how much hurt would be caused by whom and to whom in the final rounds, the social factor is the social factor. Those determined to play pranks with history cannot however be easily dissuaded. That is late. That is however also dialectical materialism. Greene was aware that he had no full and satisfactory answer to the query why he shied away from communism. It was conceivably lethargy of a sort, but there was also that

overhang of fidelity to one's beliefs, which defies logic. Alternatively, could it be that ultimate fatalism has taken over since, between perdition and absolution, there is so little to choose, why cross over? Greene did not repudiate communism, he

merely decided to be where he was. It was not choice, but non-choice. That ambivalence was his philosophy. Mrinalini Sarabhai should rather re-read the old Graham Greenes than write to the newspapers.

COMPANIES

Reduced Profit Margin

Kumaran Pola

ELECTRONICS CORPORATION OF INDIA's net sales increased by 26 per cent to reach Rs 248.05 crore during the year ended March 31, 1991. Although the corporation could achieve moderate growth rates of 12 per cent in operating profits and 8 per cent in net profits, there was a setback to the overall return on investment. The main factor responsible was a deterioration in the net profit margin on sales from 1.54 per cent in 1988-89 to 1.33 per cent in the latest year. But for the improvement in the assets utilisation ratio from 0.65:1 to 0.69:1, the return on investment would have worked out still

lower. The return on owners' equity too was lower at 4.85 per cent compared to 4.94 per cent in the preceding year.

There were receipts from the government of India towards equity capital of Rs 3 crore and unsecured short term and long term loans from the government Rs 3 crore in 1989-90. The debt/equity ratio rose from 1.51:1 to 1.87:1. Despite the tilt towards debt in the capital structure the interest coverage ratio improved from 1.35 times to 1.40 times. Short term liquidity showed improvement as reflected in a higher current ratio of 1.73 as against 1.65 in the preceding year.

Not applicable Not quoted
Rs in crore A & A Man & C Mehra

however, this was achieved through inventory accumulation and withholding the collection of sundry debts.

There was a funds-flow of Rs 67.86 crore during the year. The funds were raised through increases in share capital of Rs 3 crore, reserves and surpluses through transfers to reserves from profits Rs 3.29 crore, current liabilities and provisions on account of additions to sundry creditors Rs 14.70 crore, short-term borrowings Rs 20.33 crore and long-term borrowings Rs 13.86 crore. Decreases in cash and bank balances Rs 11.11 crore and miscellaneous current assets Rs 1.57 crore also represented sources of funds during the year. The corporation utilised the funds to increase various assets; fixed assets by Rs 11.71 crore mainly in the form of plant and machinery in the process of installation, inventories of raw materials and stores and spares by Rs 19.80 crore, receivables by a huge Rs 30.55 crore and intangible assets in the form of capitalised expenditure Rs 5.81 crore.

DREDGING CORPORATION OF INDIA

Higher Profit

DREDGING CORPORATION OF INDIA, with a 23 per cent growth in main income, was able to increase operating profits by 110 per cent and net profits by 58 per cent during the year ended March 31, 1990. Sales/main income reached an all-time high of Rs 137.79 crore during the year. Operating and net profits amounted to Rs 20.63 crore and 9.35 crore respectively. The improvement in the expenses to main incomes ratio from 3.89:1 in 1988-89 to 0.76:1 in 1989-90 was the main factor which buoyed up profits.

According to the directors of the corporation, the substantial growth in turnover was achieved mainly on account of better performance of dredgers, greater availability of work particularly for cutter suction dredges, fewer drydockings and less downtime of the crafts. To augment the existing capacity and to meet the future requirements of the country, orders were placed with a Dutch yard for the construction of two shallow draft trailer suction dredgers each of 4,500 cubic metre hopper capacity. There are plans to acquire sophisticated survey crafts with electronic depth recording and position finding equipment to facilitate effective dredging control. The corporation entered into a five-year collaboration with a leading Dutch dredging company. Accordingly, the corporation would get a very high power cutter suction dredger with rock dredging capacity. The Dutch company will collaborate in the dredging

work in the Hooghly river.

The overall return on investment of the corporation improved from 4.59 per cent in 1988-89 to 4.98 per cent in the latest year. This was achieved despite worsening of the assets utilisation ratio from 0.37:1 to 0.31:1 as the net profit margin on the main income advanced from an already impressive rate of 12.26 per cent in 1988-89 to 15.81 per cent in 1989-90. Simultaneously, the corporation earned for its shareholders a higher return on owners' equity at 9.93 per cent in 1989-90 compared to 6.94 per cent in the preceding year.

With the induction of long-term debt in the form of deferred payment liabilities, the capital structure showed a debt/equity ratio of 0.46:1 as against 0.27:1 in the preceding year, which was still far below the norm of 1:1 fixed by the Bureau of Public Enterprises. However, in view of the large operating profits earned during the year, the interest coverage ratio more than doubled to 13.93 times in 1989-90 from 5.53 times in the preceding year. The current ratio slipped from 3.60 in 1988-89 to 1.86 in 1989-90 reflecting some pressure on the working capital position. As against moderate increases in various items of current assets, there was a substantial increase in the sundry creditors.

The balance-sheet changes of the corporation indicated a funds-flow of Rs 62.19 crore. The pattern of funds mobilisation was as follows: increases in reserves and surpluses Rs 9.35 crore, current liabilities and provisions Rs 30.10 crore, short-term borrowings Rs 0.64 crore and long-term borrowings Rs 19.51 crore. Decreases in inventories by Rs 0.61 crore, receivables by Rs 1.67 crore and investments by Rs 0.31 crore also constituted sources of funds during the year. The funds were utilised to invest Rs 39.29 crore in fixed assets in the form of dredgers and to increase cash and bank balances by Rs 14.12 crore and miscellaneous current assets by Rs 8.78 crore.

BHARAT HEAVY PLATE AND VESSELS

Large Steel Plant Orders

BHARAT HEAVY PLATE AND VESSELS recorded a 4 per cent increase in net sales to Rs 137.79 crore during the year ended March 31, 1990, despite the uneven flow of orders during the preceding year. However, due to spurt in costs (raw material cost by 20 per cent, employees cost by 21 per cent, depreciation by 10 per cent, interest cost by 16 per cent and tax provision by 43 per cent) net

IN THE CAPITAL MARKET

Weldflux Engineering

WELDFLUX ENGINEERING (WEL), a Hyderabad-based company promoted by technocrat entrepreneur S Vijay Bhaskar under technical collaboration of Commercysoudure of France, is putting up a 100 per cent export-oriented hi-tech project at Hyderabad to manufacture submerged arc-welding fluxes (welding consumables) used for high-pressure welding as per international specifications. The project will be set up at a capital cost of Rs 7.5 crore which will be part financed through a proposed equity issue of 24 lakh equity shares of Rs 10 each at par aggregating to Rs 2.4 crore. The collaborators, Commercysoudure, is the largest suppliers of welding products in France. They have entered into an agreement with Weldflux Engineering for export/buy-back of 80 per cent of the production. The project enjoys various tax benefits, including eligibility as '00 per cent EOU, and is likely to yield substantially higher EPS and capital appreciation benefits. The company is planning to enter the capital market soon.

Bombay Paints

BOMBAY PAINTS is raising Rs 75 lakh by issue of 7.5 lakh equity shares of Rs 10 each at par to its shareholders on a rights basis in the ratio of one share for every share held. The issue opens on May 16 and will close on June 15. Bombay Paints is engaged in formulating and manufacturing a range of highly sophisticated paints. In the marine paints division, it has the collaboration of Hempels' Marine Paints of Denmark which also hold part of the company's equity. The company has a full-fledged R and D centre which is one of the first units in the paint industry to be recognised by the government of India. The company is planning an expansion project for the manufacture of powder coatings and coil coatings with know-how imported from its foreign collaborators. During the 11 months from April 1, 1990 to February 28, 1991, the company had a turnover of Rs 27.56 crore and estimated gross profit of Rs 36.75 lakh and, after providing for depreciation and taxation, estimated net profit of Rs 14.25 lakh. The company has an uninterrupted dividend record for the last 25 years and for the year ended March 31, 1990 declared a dividend of Rs 1.40 per share.

profits declined by 16 per cent to Rs 1.84 crore from Rs 2.18 crore during 1988-89.

Although many constraints were faced by the company due to the uneven flow of orders in the previous year, the company could achieve a record value of production amounting to Rs 151.52 crore compared to Rs 136.01 crore in the previous year. The order book registered a record inflow of Rs 276 crore during the year consequent on securing major orders for tonnage air and separation plants valued at Rs 170 crore from the steel plants of SAIL and TISCO. The order book position as at the end of March 1990 stood at Rs 337 crore as against Rs 207 crore at the beginning of the year. The overall return on investment received a setback during the year and worked out at 0.85 per cent as against 1.40 per cent during the preceding year. This resulted from a slow down in the assets utilisation as shown by a lower turnover ratio of 0.63 in 1989-90 compared to 0.85 in the preceding year combined with a conspicuous fall in the net profit margin on sales from 1.64 per cent in 1988-89 to 1.34 per cent in the latest year. The rate of return on owners' equity too showed a decline from 1.40 per cent to 0.85 per cent.

During the year, the company paid Rs 2.18 crore to the government towards repayment of term loans. Through the addition of Rs 1.42 crore received from the government towards equity and transfer of profits to reserves, the company could strengthen its equity base and bring down the debt-equity ratio from 1.36:1 in 1988-89 to 1.28:1 in the latest year. The current ratio worked out lower reflecting the tightening of the working capital position. There was a disproportionate increase in current liabilities and provisions mainly on account of advances received from the customers. Of the funds invested in current assets, a large portion was locked up in inventories and receivables.

The funds-flow during the year amounted to Rs 69.17 crore. Increases of Rs 1.42 crore in share capital which was received from the government towards equity capital, reserves and surpluses Rs 1.84 crore, current liabilities and provisions Rs 56.91 crore and short term borrowings Rs 1.86 crore were the sources of funds during the year. A decrease to the tune of Rs 7.14 crore in miscellaneous current assets too was a source of funds. The company utilised the funds to reduce long-term borrowings by Rs 0.84 crore. The balance funds were used to increase net fixed assets by Rs 0.34 crore, inventories by Rs 26.48 crore, receivables by Rs 29.43 crore, cash and bank balances by Rs 11.63 crore and intangible assets in the form of deferred revenue expenditure by Rs 0.46 crore.

PSI DATA SYSTEMS

Higher Stake for Bull

PSI DATA SYSTEMS, the Indian affiliate of Bull SA of France, has registered a sales turnover of Rs 22.77 crore for the year ended March 31, 1991. Of this, the revenue out of software exports has constituted Rs 9 crore. Viewed against a disappointing year for the computer industry in general this performance can be considered satisfactory, despite an operating loss of Rs 54 lakh. Tata Electric has acquired 10.47 per cent equity stake in PSI Data Systems. Moreover, Bull has decided to increase its stake in the Indian outfit from 26 per cent to 40 per cent. As a result, the equity capital of the company will go up from Rs 6.5 crore to Rs 27 crore. According to Mark Jennings, managing director of the company, the participation of Tata Electric in the equity is purely a financial one. Moreover, the company has business dealings with two other Tata companies, Nelco and Tata Consultancy Services. Because of the increased presence of the Bull group in the company, its name will be changed to PSI Bull India. The company is fully integrated within the Bull group. In the meantime, the Rs 14.6 crore state-of-the-art manufacturing facility at Peenya in Bangalore to

manufacture DPS 7000 series mainframes has commenced production.

IGGI RESORTS

Growing Network

IGGI RESORTS INTERNATIONAL, a property time-share (PTS) company, was started in 1988 by A Ignasius, and NRI from the US. The first attempt by IGGI Resorts proved a great success at Vailankanni where 10 cottages have been constructed and sold as PTS Weeks and Short Breaks. Three other locations were then identified, Kodaikanal, Ooty and Mahabalipuram and the company has future plans for Yercaud and Mercara. In Kodaikanal 20 cottages are being constructed on a 0.87 acre plot of land. 50 per cent of the construction will be ready before this year end. In Ooty IGGI will come out with more than 100 cottages. The first phase of the Ooty project is expected to be completed by the summer of 1992 and immediately IGGI will go to places like Yercaud and Mercara while continuing the second phase of the Ooty project. In the meanwhile, arrangements are being made at locations like Shimla, Goa, Lonavala, etc, for tie-ups in order to have exchange facilities for the benefit of customers.

APPOINTMENTS

Delhi Based Development Support Agency is looking for

ASST MANAGER (Personnel & Admn) — Person with sound knowledge of Personnel & Admn preferred. Computer proficiency will be an advantage (Scale 2200-80-3000-EB-100-4000; Total Salary Rs. 3472 plus Housing and Group Transport).

JR EXECUTIVE (Personnel & Admn) — Having good working knowledge in Personnel & Admn matters (Scale 1400-50-1900-EB-60-2500, Total Salary Rs. 2894).

SECRETARIAL STAFF — Proficiency in shorthand and typing, fluency in English, supported with working experience. Proficiency in Word Processor and Data Entry preferred. (Scale 1150-40-1550-EB-50-2050; Total Salary Rs. 2404)

All posts carry allowances like Children Education, Medical, LTA, PF, Gratuity, etc.

Apply in confidence within 15 days to
POST BOX 3037,
New Delhi - 110 003.

ANDHRA PRADESH

Recurring Patterns

M Shatrugna

The choice of candidates by both the Congress(I) and the TDP, the two principal contestants in the coming elections, reflects the pattern of dominance of different castes in the three regions of the State—Rayalaseema, Andhra and Telengana.

TOBACCO tycoons, liquor barons, civil contractors and of course film stars from the upper castes, especially from the Reddy and Kamma groups, have received the major share of Lok Sabha tickets in Andhra Pradesh this time. As usual the trend was set by the ruling Congress(I) when it gave powers to the party's parliamentary board to nominate the candidates. Though chief minister Janardan Reddy had his own share of nominees, most of the candidates who had direct access to the high command got the tickets.

Andhra Pradesh with 42 Lok Sabha seats has eight reserved seats—6 for the SCs and 2 for the STs. For the 34 general seats, the Congress(I) is fielding Reddys (13), Kammas (5), BCs (5), Rajus (4) and Christian (1), the rest being from the forward castes. The caste composition of the candidates of the National Front (of which the TDP is the major partner) is more or less the same with 11 Reddys, 8 Kammas, 7 BCs, 2 Rajus and one Muslim, the rest being forward caste people.

The Reddy community dominates the Rayalaseema districts of Chittoor, Cuddapah, Anantapur and Kurnool. This rain-starved area is supposed to be one of the most volatile regions in the State with the Reddy community dominating the political and economic scene. Though it has produced prominent Congressmen like Neelam Sanjeeva Reddy, Damodaram Sanjiviah and Kotla Vijayabhaskara Reddy, the region has remained economically backward. For the seven general category seats in this area, the Congress(I) and the TDP have each fielded 6 Reddys and 1 BC. The other constituents of the National Front have no representation in this region.

In the politically more articulate Andhra region, for the 15 general seats, the Congress(I) is fielding 5 Kammas, 4 Rajus, 2 Reddys, 2 BCs, 1 Brahmin and 1 Christian. The TDP has fielded 6 Kammas, 2 BCs, 2 Rajus, 1 Kshatriya, 1 Reddy and 1 Muslim. This region will witness fiercely-fought electoral battles between the Congress(I) and the TDP. The Con-

gress(I) has fielded business tycoons like Kavuri Sambasiva Rao (Machilipatnam), Rayapati Sambasiva Rao (Bapatla) and Madduri Subbarami Reddy (Ongole) as well as film stars Krishnam Raju (Narasapur), Ghattamaneni Krishna (Eluru) and Jamuna Ramana Rao (Rajahmundry). T Subbarami Reddy whose rags-to-riches rise is a legend in recent Andhra history is being fielded from Anakapalli where the party managed to win with a 9-vote majority in the last Lok Sabha poll. While Uma Gajapathi Raju, the estranged wife of P Ananda Gajapati Raju and a friend of the Gandhi household, is being nominated once again from Visakhapatnam, Ananda Gajapathi Raju who lost from Bobbili in 1989 has been nominated once again from the same constituency. While the coastal region has the nonagenarian N G Ranga contesting once again from Guntur (much against the opposition of the local Congress rank and file), Kasu Venkata Krishna Reddy, a nephew of Kasu Brahmananda Reddy, former chief minister, has been renominated from the prestigious Narasaraopet constituency. In fielding candidates with such diverse backgrounds, the Congress(I) has evidently decided against taking any chances in its clash with NTR against the background of the rapidly changing national political scenario. As for the TDP, barring the elder son-in-law of NTR, D Venkateswara Rao, who is contesting from Bapatla, most of the candidates are either relatively new to politics or 'non-glamorous' individuals from humble backgrounds. With the exception of industrialist Bolla Bulli Ramatah (Eluru) who was elected in 1984 but lost in the last Lok Sabha poll, the rest of the candidates in the region will have to depend on NTR for votes. In this region the two ST constituencies, Bhadrachalam and Parvatipuram, have been allotted to the Front partners, CPI and Congress(S), respectively.

In the Telengana region, which by and large has been supporting TDP and the other constituents of the National Front,

the TDP is contesting 7 of the 12 general seats, the rest being allotted to the NF partners—CPI(I), CPI(M) (2) and Janata Dal (2). For these seats, the Reddys have got the lion's share of five nominations from the Congress(I) and seven from the NF. For the rest, the Congress(I) has fielded 2 BCs, 2 forward caste persons and a Muslim. The NF has selected 2 BCs, 2 forward caste persons and a Kamma. In this region also the Congress(I) has fielded veterans with decades' of political experience like J Chokka Rao (Karimnagar), R Surender Reddy (Warangal), M Baga Reddy (Medak), Chakilam Srinivasa Rao (Nalgonda), G Venkataswamy (Peddapalli) and the up-coming liquor tycoon T Bala Goud (Nizamabad). The TDP once again has settled for 'non-glamorous' candidates whose electoral prospects solely depend on NTR and anti-Congressism. While the CPI(M) has once again nominated the ageing communist Bhim Reddy Narasimha Reddy from Miryalguda, the CPI has nominated the veteran communist Dharma Bhiksham for Nalgonda. From the urban Secunderabad constituency the Janata Dal has fielded K Pratap Reddy, advocate and civil libertarian. In the Hyderabad constituency the TDP has fielded P Indra Reddy, ruling TDP MLA and a one-time radical student leader who was interned during the Emergency, to fight the Majlis supremo Sultan Salahuddin Owaisi, a member of the dissolved Lok Sabha. The TDP, which took a scrupulously secular position in the old city politics during its entire seven-year rule in the State, is challenging Owaisi on the issue of secularism. In contrast, the Congress(I) which had a major share in the communal politics of the old city, especially in the December 1990 riots, failed to nominate a candidate until the last day of filing of nominations as it was finding it difficult to select a 'secular Congressman', preferably a Muslim. Incidentally, this constituency will also see a major communal divide between the Hindus and Muslims as the BJP sitting MLA, Baddam Bal Reddy, is contesting against Owaisi on the issue of 'Hindutva'. Though the TDP entry will have a sobering effect on the electorate, the Owaisi-Bal Reddy battle will further alienate the Muslims from the majority community.

The 'third force' represented by the BJP is contesting 36 seats. Though it has only five MLAs in the present assembly and could win only one seat in the 1984 Lok Sabha poll (when it was in alliance with the TDP) it is likely to adversely affect the prospects of the National Front, especially

the TDP, in a number of constituencies this time.

While big money and muscle power will play a major role in the Andhra region, the gun will rule the roost in the Rayala seena region. The portents are seen in the Cuddapah constituency where the Congress(I) muskman Y S Raja Sekhar Reddy (a former minister who was involved in a shooting case in the State secretariat premises when he was holding the education portfolio) is contesting. The polling date was initially postponed from May 20 to 26 as the Election Commission thought that the constituency was 'super sensitive' and hence needed special attention. It

was later reverted to the original schedule after the TDP had protested against the change of dates.

The Telengana region will have a new set of problems in the election boycott call given by the Peoples' War Group of Naxalites. Unlike in the last poll, the PWG has declared that this time it would "implement the boycott call 'seriously'". The boycott call presumably will lead to serious law and order problems, especially in the districts of Khammam, Warangal, Kareemnagar, Nizamabad and Adilabad where the PWG has a strong base and where the other (CP(M)) groups are contesting the elections.

the college managements. By holding 'elections' from among a body of largely nominated members, not only is the purpose of public accountability not served but, instead, the university bodies have become victims of petty politicking and horse trading of a very non academic nature. It has given rise to a whole new breed of educational manipulators, 'mister fix-its' who have come to dominate the working of universities.

Surprisingly, even with the drawbacks of the present set up so glaringly obvious, there have been no concerted effort by the parties most affected to rectify the situation. With a couple of exceptions, most of the student unions and teachers' organisations have shown no interest in addressing themselves to this problem and proposing feasible solutions. In the circumstances, it was perhaps inevitable that the initiative for reform would pass to the government. The government of Maharashtra has recently prepared a comprehensive bill to amend the universities acts and it may be presented to the state assembly in the forthcoming monsoon session or whenever it is considered politically expedient by the party in power.

From the available information, it is clear that the modifications proposed under the government bill are going to be of detail rather than of substance. The major difficulties that beset the universities administration today, as mentioned above, are the diffused nature of responsibilities and authority, an (often) artificial division of a problem into its academic and non academic parts, a reluctance to carry out meaningful reforms in the examination system, and so on. None of these difficulties are likely to be solved by having only 20 members on the academic council instead of the present 50 or more or by increasing the number of government nominees in the executive council or by a mild tinkering with the examination system. Yet from available information, the proposed bill does not go much further than this.

It is undoubtedly true that universities and colleges are suffering from rapidly declining standards of both academic activities and scholarship as well as routine administration. For a proper nurturing of the first, it is important that the second aspect of the functioning of a university be also well looked after. Modifications in the universities acts have to be judged only from the limited point of view of how they would help in toning up the university administration which, in turn, will help in improving the academic standards of the university. Even from this limited point of view, the proposed new bill of the government of Maharashtra is unlikely to achieve much.

Tinkering with Higher Education

J V Deshpande

The modifications proposed in the Maharashtra government's bill to amend the universities acts in the State deal with matters of detail rather than of substance and will therefore, achieve little even in terms of toning up the administration of the universities, not to talk of raising academic standards and performance.

AMONG educationists as well as people at large, there are no two opinions about the rapidly declining standards of higher education in India. All are agreed that in the past couple of generations the quality of teaching and research and of scholarship among the academics has declined precipitately in most of the colleges and universities and that this decline shows no signs of being halted.

In fact, the situation may be said to have taken a turn for the worse. Of late, universities in the country have shown themselves to be increasingly incapable of coping with even routine administrative chores. It has become commonplace to see a university taking six months or more to complete an examination and declare its results or two years or more to fill a faculty vacancy. Even if one overlooks the reports of serious malpractices which are regularly reported from most of the institutions of higher education, it has to be accepted that the situation in colleges and universities is dismal indeed.

While there is unanimity about the all round decline in the working of the colleges and universities, this is not the case when it comes to diagnosing the causes of such decline. A rapidly increasing student body, combined with a significant reduction in per capita outlay on higher education by government in the past few years, also a mushroom growth of universities and colleges and their staffing by inadequately qualified and poorly motivated faculty are some of the reasons often cited for the present unhappy state of affairs. Many persons also attribute it

to the new 10+2+3 pattern of education which was put into effect in the country in the mid seventies.

In the mid seventies again, the government of Maharashtra modified the structures of the different universities in the State. By enacting an essentially uniform act, it homogenised the workings of all the non agricultural universities in the State. Ironically, instead of toning up the administration of the universities, their performance since then has noticeably worsened.

The act under which universities in Maharashtra have been functioning for the past 15 years abounds in several unpleasant features—ranging from the mode of selecting the vice chancellor to a faultily designed division of power and responsibility among the various organs of the university system. Not content with directly putting its own nominees on the various decision making bodies of universities, the state government also keeps with itself the final authority in respect of many vital issues, be they the fixation of the salary of a newly appointed teacher or the granting of affiliation to an ill equipped new college sponsored by influential parties.

As institutions sustained by public funds, it is appropriate that colleges and universities should be accountable to the public. Ostensibly, this is achieved by having a sprinkling of elected individuals on some of the university bodies. In practice, however, the electors in most cases are mainly nominated by the government or

Impact of Disintermediation

The trends in both deposits of commercial banks and credit to the commercial sector in 1990-91 showed the impact of growing financial disintermediation in the economy.

THE expansion in supply of money (M_1) decelerated both in absolute amount and in percentage terms in the fiscal 1990-91, to Rs 12,136 crore or 14.9 per cent from Rs 14,814 crore or 22.2 per cent in 1989-90. All the three components of M_1 —currency, demand deposits and other deposits with Reserve Bank of India—shared in the expansion. The contribution of currency at 55.3 per cent is almost the same as that in 1989-90. However, the absolute increase in currency during the year at Rs 6,714 crore was much lower than the increase of Rs 8,231 crore in 1989-90 perhaps due to significant widening of the balance of payments deficit. The rise in demand deposits by Rs 4,040 crore or 11.9 per cent during the review period was also sizably lower than that of Rs 6,217 crore or 22.4 per cent in 1989-90. Other deposits with Reserve Bank on the other hand recorded a significant rise (which may be reflective of India's bilateral trade expansion) and contributed to the money supply expansion during the year to the extent of 12.4 per cent. In spite of an accretion to time deposits of Rs 22,164 crore or 15 per cent which pushed their share in M_1 to 64.6 per cent as compared with 60.6 per cent in 1989-90, expansion in M_1 at Rs 34,300 crore or 14.9 per cent was lower in 1990-91 (Table 1). This growth was the smallest recorded in the last nine years (Table 2).

Net bank credit to government expanded by Rs 21,778 crore or 18.7 per cent in 1990-91 as compared to a lower expansion of Rs 19,552 crore or 13 per cent in 1989-90. The Reserve Bank of India and the commercial banks extended loans in the proportion of 62.4 per cent and 37.6 per cent in 1990-91 as against 66.4 per cent and 33.6 per cent in 1989-90. The increase in the Reserve Bank's accommodation to the Central government of Rs 13,594 crore as compared to Rs 13,031 crore in 1989-90 was a record.

The order of growth in bank credit to the commercial sector, on the other hand, at Rs 19,552 crore works lower by Rs 3,631 crore than in 1989-90. Even this order of advances is due to the continued buoyancy in demand for funds for food procurement operations. The decline in the rate

of growth of non-food credit was in part due to poor industrial sector performance and in part due to writing off of agriculture and other loans. The increase of Rs 1,429 crore in the net foreign exchange assets of the banking sector was mainly on account of the appreciation in the value of gold held by the Reserve Bank following its revaluation at the international market price effective from October 17, 1990, which also had a corresponding effect on Reserve Bank of India's net non-monetary liabilities which bulged by Rs 7,960 crore or 43.7 per cent during the year.

The operations of scheduled commercial

banks in 1990-91 was characterised by a subdued expansion in both bank deposits and credit and an appreciable increase in the banks' investment. Accretion to bank deposits in 1990-91 at Rs 23,754 crore was lower by Rs 2,601 crore than the rise of Rs 26,355 crore in 1989-90. The ratio of demand and time deposits incrementally worked out to 6.1 per cent and 93.9 per cent, respectively, as compared to 20.9 per cent and 79.8 per cent in 1989-90 (Table 1). The rate of growth at 13.7 per cent is the lowest recorded since bank nationalisation in 1969 (Table 3). This growth might have been even smaller but for the smart jump of Rs 6,080 crore in deposits during the last week of the fiscal year (between March 22 and March 29). However, during the major earlier part of the year the addition to deposits was more or less even, averaging about Rs 2,000 crore per mensem. This trend seems to be the direct result of the increasing number of options that are available in short and long term for deploying funds profitably—such as certificates of deposits (CDs) for short

TABLE 1. TRENDS IN MONEY SUPPLY

Notes: (1) Cash-deposit ratio is defined as the ratio of cash in hand and balance with RBI to aggregate deposits.

(2) Figures in brackets are percentage variations over the previous year.

TABLE 3: TREND GROWTH OF SCHEDULED COMMERCIAL BANKS' DEPOSITS AND CREDIT (Per cent)

| Year | Scheduled Commercial Banks Deposits | Credit |
|---------|--|--------|
| 1969-70 | 15.9 | 16.9 |
| 1970-71 | 17.5 | 18.0 |
| 1971-72 | 20.3 | 12.4 |
| 1972-73 | 21.6 | 16.2 |
| 1973-74 | 17.3 | 21.0 |
| 1974-75 | 16.6 | 18.4 |
| 1975-76 | 19.7 | 24.1 |
| 1976-77 | 24.1 | 21.1 |
| 1977-78 | 26.4 | 13.4 |
| 1978-79 | 21.6 | 19.1 |
| 1979-80 | 17.6 | 21.0 |
| 1980-81 | 19.6 | 17.8 |
| 1981-82 | 15.1 | 17.0 |
| 1982-83 | 17.4 | 19.6 |
| 1983-84 | 18.0 | 16.3 |
| 1984-85 | 19.2 | 18.5 |
| 1985-86 | 18.2 | 14.5 |
| 1986-87 | 20.3 | 12.9 |
| 1987-88 | 14.9 | 11.4 |
| 1988-89 | 24.7 | 26.7 |
| 1989-90 | 17.9 | 18.0 |
| 1990-91 | 13.7 | 12.1 |

term and the mutual fund schemes of various financial institutions. As a sequel to this lower expansion in deposits the Reserve Bank had to come to the rescue of banks to the tune of Rs 4,131 crore during the year.

The falling trend in bank deposits together with RBI's directive to banks to keep the incremental non-food credit deposit ratio at 60 per cent forced the latter to keep a strict vigil on their lending portfolio during the year. However, the growing disintermediation with companies accessing the market directly as well as improved internal accruals also led to a decrease in the demand for credit by the corporate sector during the year. Hence the expansion of bank credit was very much subdued at Rs 12,788 crore as against Rs 16,080 crore in 1989-90. However, there was a sharp rise in food procurement credit by—Rs 2,702 crore against Rs 1,090 crore in 1989-90.

The deliberate slow down of credit creation resulted in higher investment by banks during the year. Addition to banks' investment in government securities at Rs 11,016 crore or 17.1 per cent in 1990-91 was higher than Rs 8,894 crore or 16 per cent in the previous year.

The non-food credit expansion of Rs 10,086 crore or 9.7 per cent was meagre as compared to Rs 14,990 crore or 16.9 per cent of last year. The resultant incremental non-food credit-deposit ratio was only 42.5 per cent in 1990-91 (compared to 56 per cent last year) and was below the norm of 60 per cent fixed by the Reserve Bank.

Appropriating Sri Sankaradeva

Kamarupce

Why this desperate attempt by the pan-Indian cultural establishment to 'Indianise' Sri Sankaradeva, a figure considered by the Assamese people as the quintessential symbol of Assamese nationality?

THE recent 'National Seminar' on Sri Sankaradeva (circa 1449-1568), the great religious reformer of Assam viewed as a consolidator of the Assamese as a people giving a distinct identity to the language and culture of the people inhabiting the Brahmaputra valley and some areas beyond to the west, presently in northern Bangladesh and West Bengal, organised jointly by the Sahitya Akademi and the Forum for Sankaradeva Studies at the Rabindra Bhavan in Guwahati (January 29-31) has had, perhaps inescapably, also an implicit political content. The very holding of such a 'National Seminar' on the life and work of one who for long has been relegated to an obscure footnote (if at all) in the intellectual history of the country as written by most pan-Indian scholars (with a few honourable exceptions) at a time when voices are being heard seeking to distance 'Asom' from 'India' to the extent of pressing for a 'Sovereign Asom' is surely significant.

The burden of the scholarly papers read during the seminar and the various polemical interventions was that Sri Sankaradeva, who is quite rightly viewed by the Assamese speaking people of the Brahmaputra valley (henceforth referred to as the Assamese people) as the person who gave them their very identity as a people, who used the Assamese language creatively and consolidated its idiom, was actually a pan-Indian figure who never thought of himself as 'Assamese', but only as an 'Indian', or more precisely, as a 'Bharatavasi'.

Such attempts at appropriation of a figure considered by the Assamese people as the quintessential symbol of Assamese nationality by the pan-Indian cultural establishments have come in the context of the assertion of an exclusivist Assamese nationalism seeking sovereignty for the 'people of Asom' (in which category is included not merely the Assamese people but several other strands of people inhabiting the region). The most notable exponent of this line of thinking is the self-confessedly revolutionary and secessionist outfit, the United Liberation Front of Asom (ULFA). For, for several decades, indeed centuries, the significance of Sri

Sankaradeva as the theoretician and proponent of the reformed form of Hinduism in Assam, thus weakening the stranglehold of priestcraft on caste Hindu Assamese society and assisting in the consolidation of the Assamese as a people, transcending to the extent possible the old caste barriers (though still within prescribed limits), corresponding to similar reformist movements within the Hindu fold around the same period (14-16 centuries) in several other parts of the country, has hardly been recognised. Indeed, even the name of Sri Sankaradeva is little known outside specialist circles among whom his achievement marked merely a marginal footnote as it were in the evolution and consolidation of the reformist Bhakti movement in most parts of the country. Even now it is not uncommon for persons from outside the region to claim acquaintance with Sri Sankaradeva, solemnly maintaining that actually contrary to what people in Assam think he actually belonged to Kerala and not to Assam.

Given such perceptions outside the State it was a pleasant surprise that one of the highest symbols of pan-Indian intellectual establishments, the Sahitya Akademi, should join hands with a decidedly humbler cultural outfit in the State, the Forum for Sankaradeva Studies (whose formation and modest attempts to propagate Sankaradeva's ideas is only one of the many signs of the deep and abiding commitment of the most Assamese of concepts and affirmations to seek a pan-Indian identity) and hold the 'National Seminar'. Scholars were drawn from several parts of the country, including distant Kerala, every one of whom was rather self-consciously adulatory about Sankaradeva's work. Considering the virtual absence of translations of Sankaradeva's works—the first and only translation of Sankaradeva's *Kirtana Ghosha* by Sri Chandrakanta Mahanta, a truly voluntary labour of love and devotion with no support from any pan-Indian establishment, was published only a few months ago and has received no notice even within the State—one wonders how the scholars many of whom could not be

presumed to be familiar with the language of the corpus (or even with Brajavali Bhasha, the language that is now being claimed in some circles to have been actually the language of Sankaradeva, another attempt at appropriation into which one need not go here) could have been so eloquent about the truly 'Indian' dimensions of his life and work.

It is true that Sri Sankaradeva did not view himself as especially 'Assamese'. There is no reference in his works to 'Assam' or any of its derivatives—concepts that were to acquire currency and political meaning long after Sankaradeva. He himself is known to have celebrated in several passages his commitment to Bharatavarsha. Virtually every speaker during the seminar referred with great satisfaction to the well-known passage about him by his disciple Madhavadeva where Sankaradeva is described as acknowledging with thankfulness his Indian identity.

Dhanya dhanva kalilal

Dhanya naratanu bhal

Dhanva dhanya bharata banish

though one of the interlocutors was naughty enough to wonder whether Sankaradeva had been aware of any other entity apart from Bharata to thus invest such staunch admiration for Bharata with some discriminating flavour.

But the question remains: Why this desperate attempt to appropriate Sankaradeva since in Assam itself there has been no move to view him in exclusivist terms? On the contrary, almost everything written by Assamese scholars on Sankaradeva emphasises the pan-Indian character of his personality and the pan-Indian significance of his work, though tinged with some regret that these aspects of his personality and work have not received due recognition outside the region. The fact that Sankaradeva travelled in many parts of India outside the Ahom kingdom and the Koch kingdom, both of which he straddled and was influenced by and in turn influenced the philosophical thought of other figures of the Bhakti movement does not in the least take away the essentially Assamese character of his life and work. After all he welded together what may be called the Hindu Assamese personality liberating it from the clutches of priestcraft, under

lining the possibility of direct communion with god (in his case Vishnu and his manifestations) and preached what has come to be known as *ekasara dharma*, the religion of surrender to one god. All these elements have gone into the making of the distinct and identifiable Assamese personality, one of the many strands that have gone to the making of the Indian personality of which it is a part and with which it has been co-existing in a relation of creative harmony and tension for centuries.

Like other nationalities of India that is Bharat, the Assamese nationality too has a clear and distinct personality with a basis in language, a world view and a view of man and his relation with his god which are all unique to Assam. The most obvious way of paying tribute to his son of Assam, even if it was being done by the pan-Indian cultural establishments, would have been to acknowledge that even while being truly pan-Indian, he was also quintessentially Assamese.

But the urge to Indianise even persons who do not require any such cosmetic treatment is apparently not confined only to the practitioners of Hindutva. For the burden of many of the papers read during the seminar, and even more so of the summings up at various sessions, appeared to be oppressively bent upon on driving home the point that Sankaradev was a pan-Indian figure, which he undoubtedly was, almost to the exclusion of the Assamese roots from which his Indian sensibility received its nourishment and ideological inspiration.

Such near-bullying kind of attempts to appropriate even the most explicit and powerful symbols of vibrant and living regional cultures into a superimposed Indian identity from above, are not likely to advance the Indian cause one bit. Indeed there was a feeling among many who patiently sat through the three-day seminar that after taking away the natural resources of the region (tea, petroleum, timber and the like) and exploiting them for the enrichment of India, the Indian establishment has now bent upon taking away and making its own the very soul of Assam, seeking to divest the people of their pride and the very 'reason for their existence'.

Such appropriation is not only not necessary, but is also not desirable even from the requirements of affirming the State's and the people's enduring and indissoluble links with India. The fact is that such a pan-Indian personality is emerging even in Assam, albeit gradually, not because, but despite such efforts. However, such intellectual aggressiveness and arrogance may retard, not advance, the process.

TAMILNADU PETROPRODUCTS LIMITED

No. 6, Nungambakkam High Road, Madras - 600 034

NOTICE

It is hereby notified for the information of the public that TAMILNADU PETROPRODUCTS LIMITED proposes to make an application to the Central Government in the Department of Company Affairs, New Delhi, under sub-section (2) of Section 22 of the Monopolies and Restrictive Trade Practices Act, 1969 for approval to the establishment of a new unit. Brief particulars of the proposal are as under:

1. Name and address of the applicant
TAMILNADU PETROPRODUCTS LIMITED
6, Nungambakkam High Road, Madras - 600 034
2. Capital structure of the applicant organisation
Authorized Capital: 10 00 00 000 Equity Shares of Rs. 10/- each
1. Subscribed and Paid up Capital: Rs. 48 75 00 000/-
3. Management structure of the applicant Organisation indicating the names of Director, including the Managing/Whole time Directors and Manager, if any.
The Managing Director is in charge of the day to day management of the Company under the superintendence, control and guidance of the Board of Directors.
Board of Directors:
The Hon. P. V. Narayana Murthy IAS, Chairman
The Hon. A. C. Murthy IAS, Vice Chairman
The Hon. K. V. Srinivasan IAS, Managing Director
The Hon. A. C. Lakshminarayana IAS
The Hon. B. D. Dadasaheb
The Hon. M. Srinivasan
The Hon. A. M. Ravi Varan IAS
The Hon. K. Chandrasekhar IAS
The Hon. M. B. Prasad
The Hon. K. V. Ramaswami
The Hon. V. L. Shah
The Hon. C. S. Lakshminarayana
The Hon. P. R. Sundaravachellu
4. Indicate whether the proposals relate to the establishment of a new undertaking or to a new unit/division.
It is a new undertaking.
The place of the new undertaking is Nambakkam, Thiruvallur District, Tamil Nadu.
5. Capital structure of the proposed undertaking.
Not Applicable.
Indicate the proposal relates to the production, storage, supply, distribution, marketing or control of any goods, article, or service.
Production:
(1) Name of goods, article: ETHYL CHLOROHYDRIN
(2) Proposed licensed capacity: 10 000 MTA
(3) Estimated annual turnover: Rs. 65 Crores
6. Indicate the proposal relates to the provisions of any service, state the volume of activity in terms of usual measures such as value, income, turnover, etc.
Not Applicable.
7. Cost of the project: Rs. 55.24 Crores
10. Schemes of finance indicating the amounts to be raised from each source:
Internal Generation: Rs. 11.05 Crores
Debt Finance/Term Loan: Rs. 44.19 Crores
Rs. 55.24 Crores

Any person interested in the matter may make a representation in quadruplicate to the Secretary, Department of Company Affairs, Government of India, Shastri Bhavan, New Delhi, within 14 days from the date of publication of this notice, intimating his views on the proposal and indicating the nature of his interest therein.

For TAMILNADU PETROPRODUCTS LIMITED

Place: Madras - 600 034
Date: 6th May 1991

M. B. GANESH
SECRETARY

Press on Ayodhya 'Kar Seva'

Aaghar Ali Engineer

The Press Council of India's two reports on the press coverage of the events in Ayodhya on October 30 and November 2 in some newspapers are harshly critical of such biased journalism. Laterally, they also draw attention to the issue of 'editorial activism'.

THE 'kar seva' on October 30 and November 2, 1990 attracted nation-wide attention. The language media, specially the Hindi press showed almost religious zeal in reporting the event. The Press Council of India taking note of the extraordinary biases which crept into the reporting of the event set up a five-member committee to hear complaints and prepare a report. This committee produced two sets of reports: a majority report and a minority report. The majority report was produced by N K Trikha, N R Chandran and Satish Khurana whereas the minority report was signed by K Vikram Rao and P Raman. It must be said that both the reports agree on the essentials but there is difference of emphasis. The minority report is harsher on its judgment on reporting in the Hindi press whereas the majority report has been harsher on the government of UP for its curbs on the press. The minority report while not approving of these curbs by the government also tries to understand extraordinary situation under which they were applied.

Based on these reports the Press Council passed a resolution in its meeting held at Thiruvananthapuram (Kerala) on January 21-22, 1991 censuring four Hindi dailies *Aaj*, *Dainik Jagran*, *Swatantra Chetna* and *Swatantra Bharat*. The Council felt that these papers had shown "gross irresponsibility and impropriety, offending the canons of journalistic ethics, in covering the events relating to the mandir-masjid issue on and around October 30, 1990". The Press Council also expressed "concern over the authorities taking recourse to punitive and preventive action in excess of the demands of the situation". The Council also "deplored the action of the authorities of government of UP in invoking provisions of non-existent press (Objectionable Matters) Act, 1951, and misapplying provisions of the Press and Registration of Books Act, 1867, in suppressing freedom of the press".

In fact the complaints about misbehaviour of the press had been received from various States but the Press Council limited the inquiry to two States, UP and Bihar, "as they constituted the main theatres of action in the matter". In its first round the committee held public hearings at Agra on November 21, 1990,

at Lucknow on November 22-23, 1990, at Varanasi on November 24, 1990 and at Faizabad on November 25, 1990. It also separately heard the UP chief minister, the chief secretary, the home secretary and the information secretary at Lucknow on November 26, 1990. The members also visited Ayodhya on November 25, 1990 and went round the various spots related to the incidents of October 30, 1990, and November 2, 1990 including the disputed shrine, 'shilanyas' site, Maniram Chavni and the Saryu bridge. In the second round the committee held public meetings at Ranchi on December 3-4, 1990 and Patna on December 6, 1990, where it also heard the chief minister, the chief secretary and other top officials of Bihar.

The UP chief minister Mulayam Singh Yadav named three Hindi dailies, *Aaj*, *Dainik Jagran* and *Swatantra Bharat* for inciting communal passions and the Bihar chief minister complained against the solitary paper, *Aaj* for its slanted reporting. The director of information and public relations, UP, however, named an additional paper *Swatantra Chetna* of Gorakhpur and Lucknow.

The majority report points out that *Aaj*, Kanpur, gave very provocative headlines about the events on November 2, 1990 in its issue of November 3, 1990. *Aaj* headline read *Nihatte Ram Bhakton ko Gher kar Ghanton Firing—200 Maray. Kartik ke San parv Per Khoon Se Nahayee Ayodhya, Jalianwala Bagh Kaund Beuna Pada* (Hours of Firing on Unarmed Worshipers of Ram After Rounding Them Up—200 die, Ayodhya Bathed in Blood on Kartik-day Bath, Jalianwala Bagh episode becomes petty against this). This paper's edition of October 24, 1990 carried an item under the headline, 'Mirzapur Jail Mein Ram Bhakton Ko Ghodey Kee Leed Khilayee Jaa Rahi Hey' (The worshippers of Ram are being fed horse dung in Mirzapur Jail).

The Agra edition published an evening bulletin with the headlines, '*Ayodhya Mein Firing, Sankado Hatahat, Sarkar Dwara, Mrityak Sankhya Panch Batayee*' (i.e., Firing in Ayodhya, Hundreds Injured, Denial by Government, Gives out Figure of Dead as Five). The Lucknow edition of November 2, 1990, carried a headline,

'*Sau Se Adhik Lashen Saryu mein Fainkee Gayen*' (More Than 100 Dead Bodies Thrown into River Saryu). The same edition announced in the same issue that armed 'kar sevaks' would now be pressed into the movement. A special report carrying a list of missing persons, released by the VHP, was published with the headlines, '*Yadi Balidan Nahin Huye, To Kahan Gaye Ye 307 Kar Sevaks*' (If There Were no Sacrifices Then Where Did These 307 Kar Sevaks Go?) in its issue of November 1, 1990. The paper's Bareilly edition carried headlines, much more objectionable, which ran '*Hathiaron Se Lais Ho Kar Hi Ayodhya Ayeen*', '*VP Mulayam Ko Kutton Se Nuchwayen*', '*Advani Mughaltay Mein Na Na Rahen Ki Musalman Kamzor Ya Buzdil Hein*' (Come to Ayodhya Only After Being Armed, VP Should Have Mulayam Torn by Dogs, Advani Should Have no Illusion that Muslims are Either Weak or (owards) *Dainik Jagran* also published some such items in its Bareilly edition.

The Council's report says that the Ranchi edition of the *Aaj* dated October 26, carried a screaming headline '*Ayodhya Mein Ram Mandir Toda Gaya*' (Ram Temple Broken in Ayodhya). The report also points out that the news under this headline did not mention this fact. It only said that the canopy standing over the 'shilanyas' site had been damaged and an idol in the pit had been removed. The Patna edition of the paper reported that the VHP general secretary Ashok Singhal was hit by bullet on October 30 and carried a poem which called the then prime minister a progeny of Jai Chand and likened him to Ravan.

It is also interesting to note that different editions of the same paper ran widely varying accounts of the same event. For example different editions of *Aaj* gave different figures of casualties in their different editions from different places: Varanasi: 100 dead; Ranchi: 400-500 dead and injured; Agra: 100 killed; Kanpur: 200 killed; Bareilly: 500 killed.

Commenting on this the resolution of the Press Council says that "Spreading panic and confusion in an already tense and polarised situation was dangerous to a fault in adding fuel to the fire".

According to the Press Council report the *Dainik Jagran*, Lucknow, published in its special bulletin in the afternoon of November 2, that "one hundred 'kar sevaks' had died on the spot in indiscriminate police firing on Ram Bhaktas". The figure was reduced to 32 in the regular morning edition of November 3. On November 18, it carried an item set in double column with the heading '*Shri Ram Kranti Brigade Agle*'.

Indian Institute of Advanced Study

Rashtrapati Nivas, Shimla - 171005

Advertisement No. 2/91

1. Applications on prescribed form are invited for award of FELLOWSHIPS for the year 1992-93 from scholars holding Ph D. degree and with experience of independent research at advanced level in any of the following areas:

Humanities: (i) Art and Aesthetics; (ii) Comparative Study of Literature; and (iii) Comparative Study of Religion

Social Sciences: (i) Development Studies; (ii) Comparative Study of Political Institutions; and (iii) Socio-Economic and Socio-Cultural Formations in Historical Perspectives.

Natural and Life Sciences: (i) State Policies on Science and Technology; (ii) Science, Technology and Development; and (iii) Methodologies and Techniques.

2. A few Fellowships may be awarded for projects of exceptional interest even outside these areas and also to eminent scholars not necessarily possessing research degrees.
3. About two-thirds of the Fellowships will be earmarked for those who are already working in universities, research institutions or other responsible positions. Preference will be given to those who have already done considerable work on their projects and wish to avail of the facilities at the IIAS to complete their work. The Institute does not encourage studies which involve field work.
4. The selection of Fellows will not be restricted to those who respond to this advertisement. The Institute has the discretion to select Fellows in other ways as well.
5. The detail of the amount of Fellowship grant payable to Fellows will be supplied along with the application form.
6. The term of Fellowship ranges from three months to two years, depending upon the nature of the project and only in exceptional circumstances can it be extended further upto a maximum of one year.
7. Residence at the Institute is compulsory from April to November, and optional from December to March. All Fellows are provided free hard-furnished accommodation on the campus as well as secretarial assistance.
8. The prescribed application form may be obtained from the Secretary (Administration & Finance) of the Institute by sending a self-addressed envelope (25 cm × 10 cm) or personally from the Institute by July 1, 1991. The completed application forms should reach the Institute at the latest by July 31, 1991. In case of candidates living abroad, applications will be accepted upto August 16, 1991. Those in service should apply through proper channel.

Madh Tak Mulayam Ke Haath Pair Kaat Daig? (Shri Ram Kranti Brigade Will Cut off Hands and Feet of Mulayam by Next Month). Worse, the item was based on an anonymous letter which also said that a thousand police and army personnel who are Ram 'bhaktas' were leaving their jobs and would support the brigade's activities. The same paper, in its issue of November 15, wrote in a report spread over four columns that the chief minister Mulayam Singh was very angry that not enough bullets were fired on the unarmed 'Ram bhakt kar sevaks' at Ayodhya during the past few days. A sub-heading said that the police was not in favour of firing at the unarmed 'kar sevaks'.

This paper also published from its Faizabad bureau a report across all eight columns which said '*Har Gaon Ko Ayodhya Maan Kar Sangarsh Karen*' (Consider Every Village Ayodhya and Fight). It also published in headlines, '*Ram Mandir Ke Live Das Lakh Ka Dasta Ladakoo Banega*' (Ten Lakh Strong Militant Force Shall be Raised for Ram Temple).

Swatantra Bharat, Lucknow, reported the incident of November 2 with these headlines: "Nihatte Kar Sevakon ko Bhoon Dala 100 Lak Ke Marne Kee Aashanka 25 Tashen Baramad Hazaron Ghayal" (Unarmed 'kar Sevaks' Massacred, Up to One Hundred Killed, 25 Bodies Found, Thousands Wounded). In the story, the paper reported that anywhere between 50 and 100 people were feared dead. It also gave other figures from different sources: the State's home secretary—14, news agencies—15, BBC correspondent who had returned from the spot—between 30 and 50.

The Council report comments: "Though the paper was fair in giving figures from several sources including the official, it gravely erred or thought it affordable to be callous in putting the figure of one hundred in bold headlines. In order to avoid sensationalism particularly when the atmosphere is emotionally surcharged, it is always advisable to say 'at least 50 killed' instead of saying 'up to 100 killed'."

Swatantra Chetna of Gorakhpur went even further. It had originally published a figure of 15 dead on November 2 in a special bulletin that afternoon, but at the last moment '1' was inserted by hand to make it 115. The item remained credited to the news agency 'Univarta' even after this change. This was not only irresponsible but also unethical. This paper also carried a news item under the heading '*Gorakh Nath Mandir ke Gate Par Kabza, Sadhuon Mein Dahshat, Mandir Ke Pramukh Dwar Par Virodhi Jhanda Phharye Gaye*' (Gate of Gorakh Nath

Temple Seized, Terror Among Devotees, Opponents' Flags Unfurled at Main Gate).

This news was contradicted by the temple sources. The Council report commenting on this news item says, "It may be noted that this shrine is headed by Mahant Avaidya Nath, MP, who is the chairman of the Ram Janmabhoomi Mukti Yagna Samiti. Therefore, such a news had a very serious implication from the communal and political point of view. It should not have been published without confirmation at least from the temple authorities. But no such care seems to have been taken by the paper."

Besides these papers there were some other papers whose role was also not beyond reproach. These papers whom either authorities or some members of the public criticised were *tridini* (Varanasi), *Janavatta* (Varanasi), *Awaz-e-Mulk* (Varanasi), *Amul Ujala* and *Tanzen* (Patna).

After taking stock of the role of these papers the report goes on to recommend "that the Council may express deep displeasure and serious concern at the above mentioned role of a section of the press in two States, particularly of the multi edition papers of UP which command widespread circulation, thereby influencing the opinion of a large section of people in the State. They may be reprimanded for this. The Council may also issue an appeal to all newspapers and newsmen to strictly and faithfully adhere to and carry on the noble traditions of the Indian press to maintain the highest standards of free, fair and objective journalism particularly during the periods of national crisis and communal and social strife."

The sub-committee report, however, also acknowledges the positive role played by these papers condemned above. These papers informed the people of the developing situation and also forewarned the authorities about what was in the offing. *Aaj*, for example, was first to report that the canopy at the shilanyas site had been surreptitiously removed thereby hurting the feeling of and causing unrest among the protagonists of the movement. *Dainik Jagran* and other papers reported the movement towards Ayodhya of a large number of 'kar sevaks' when the State government had declaredly choked all means of transport and blocked all passages to them and alerted the authorities about the possible trouble on November 2 by reporting an interview with Ashok Singhal.

MINORITY REPORT

The minority report is even more critical of the role of these dailies. It goes

on to say that "nationalists seem to have totally failed to maintain their integrity as responsible media persons. They obliterated the borderline between their personal affiliations and the right to know of the society as a whole. Representatives of several social and cultural organisations in the course of their evidence pointed out that the editors of some dailies had deliberately tried to paint the picture that every Indian is a Hindu, and every Hindu a 'Rambhakt'. They even preferred the word 'Rambhakt' to 'kar sevaks'."

The report also draws our attention to what it calls 'editorial activism' where the editors behaved as if they were part of the Ram Janmabhoomi campaign. Some of them even helped 'kar sevaks' to find their way to Ayodhya by letting them use press passes. The report also points out that "an editor was alleged to have used his press facilities to smuggle in Ashok Singhal (the editor, however, denied it). Some cited the case of an editor of Lucknow Hindi daily coming out of Ayodhya complex on October 30 shouting ecstatically 'kar seva has begun'. One senior editor was allegedly directing the 'kar sevaks'."

Not only this, some editors participated in the VHP rallies and made provocative speeches. Some editors were even arrested for making inflammatory speeches at the VHP rallies. Some correspondents were alleged to have acted as the VHP messengers. The minority report then comments: "We do not want to pass a judgment on these charges. But even if there is an iota of truth in these allegations, it calls for serious concern for all."

In view of all this one has to seriously debate the possibilities and limitations of the role of print media. Freedom of the press is absolutely essential for functioning of a political democracy but then this freedom is also likely to be misused by the print media in times of crisis, especially if the crisis pertains to the religious faith of newsmen—either editors or reporters. What limitations of the media are in such a crisis situation can be seen from the Press Council report.

Can the freedom of the press then be absolute and untrammelled? Looking at what happened during the Ayodhya crisis one can hardly say yes to this question. One may not deliberately violate press freedom but emotional involvement in a crisis situation can certainly blind a person to the other side of the truth. It is a fact that on Ram Janmabhoomi question the feelings of a large section of Hindus in the north were running very high and some mediapersons did belong to this section. In fact they did identify themselves with 'Rambhaktas' and 'kar sevaks'. Perhaps they could not help writing what

them. Perhaps their genuine feeling was that the authorities were not permitting the Hindus to fulfil their religious duties. They perceived the authorities as highly repressive.

Each religious group has not only its own interests but its own perceptions of social realities. These perceptions do get reflected in reporting also. But this one-sided perception of the truth, however genuine for the perceiver, may be seriously objected to by the other groups and thus may lead to conflict and tension. So as long as truth or perception of it is relative, freedom of the press will also remain relative and not absolute.

EXCESSIVE CURBS

The Press Council sub-committee not only looked into violations of norms of reporting by the newspapers but also went into allegations of excesses committed by the authorities in putting curbs on newspapers and newsmen. The report has come down heavily on the authorities too. According to the sub-committee report the complaints and allegations against the authorities were of two types. One, the government creating obstacles in the coverage of events; its officers not being available or not being communicative and curfew passes being denied or not being honoured by the police and deliberate disinformation being spread to the authorities. Two, pre-censorship being imposed, newspapers being prevented from being published, printed copies seized or not allowed to be transported or distributed, journalists being arrested, newspaper hawkers being beaten up and maltreated.

Most of the newsmen complained to the committee about access to the news sources being blocked by the authorities. On the crucial days of October 30 and November 2, newsmen were prevented from reaching spots of action. Whatever was published regarding the incidents of these days was the result of their enterprise which they undertook at great personal risk. The report makes the following observation in this context. "We have already made an observation about the utter failure of newspapers in exercising discretion and restraint in presenting facts and figures in respect of the happenings of October 30 and November 2 at Ayodhya. This failure cannot be condoned. But it also needs to be examined as to what extent the authorities were responsible for this and whether they made any conscious effort required of them on such grave occasions to inform the press and the people voluntarily, quickly and adequately, and in time to catch editions."

the basis of evidence that no proper arrangements were made by the authorities in that direction and not even a press camp was set up by them in Faizabad. The result of all this was that rumours had a field day in the absence of any official briefing. No government officer was available to the press at Ayodhya at the time of these happenings to say what exactly happened. The authorities either kept quiet or adopted a totally negative attitude towards the press. They did not allow the press persons to see the extent of damage to the shrine. Even the press conference scheduled at 4 pm on that day by the commissioner of Faizabad was cancelled without notice.

The authorities also, seized copies of newspapers. The special bulletins of Lucknow papers were quickly seized and the home department asked district magistrates all over the State to see that such news did not reach people but no clear instructions or guidelines were given to them as to how this was to be done. The Press Council report feels that "Some of the methods resorted to by several district administration were not adopted even during the Emergency when Fundamental Rights had been suspended and censorship clamped by a specific notification."

Both in UP and Bihar police officers went to newspaper offices in the evening on November 2 and the night of November 2-3, 1990 and asked journalists on duty to show them the negatives and the plates of the matter being prepared for publication. If journalists refused to oblige plates were seized and even destroyed. Bundles of mofussil editions which were already printed were either not allowed to leave or were seized inside or outside newspaper offices by crude application of force. At Allahabad, the police forcibly stopped printing of the paper in a press. A similar complaint was made at Varanasi.

However, the minority report takes a somewhat lenient view of the action by authorities. According to this report an attempt was made to "verify this point over and again at all sittings. District officials at all places took the stand that they never tried to interfere with the free functioning of the newspapers or to terrorise the staff. But most of them admitted that the local police had gone to some newspaper offices to find out what was being put out for the next day. After careful examination, we have come to the conclusion that on the crucial night measures were not intended to terrorise the staff into submission or as a punitive measure but to find out what was being printed. The *Jagran* representative at Agra said that when they told the police that

printed, they left."

The minority report has taken slightly different view about the administration creating obstacles for newsmen. It goes on to say: "After hearing from all sides, we cannot support the contention that the authorities had deliberately tried to deny opportunities to the press to cover the Ayodhya incidents or created hurdles in the way of the normal functioning of the correspondents. . . . But there have been some hurdles in their movement, partly due to the unusual atmosphere of confrontation and partly due to the lapses on the part of authorities" (emphasis in the original).

Clearly neither the press nor the authorities can be completely exonerated. There is no doubt that it was an extraordinary situation but it was also an extraordinary challenge to both for the authorities and for the press. If the press has to guard its freedom, it also has to act with a great sense of responsibility. Whatever the religious feelings of editors and reporters, the reporting should have been objective and restrained.

It should, however, also be admitted that another section of the national press did behave with restraint and sense of responsibility. Among them are not only English papers but also Hindi papers like *Navbharat Times*. This should be appreciated. That agencies like the Press Council are trying to maintain the highest standards of journalism and upbraid those guilty of violations of these norms is also commendable.

Gulf War and Anti-Imperialism in West Asia

T V Sathyamurthy

If the victory of the Iranian revolution over the regime of the Shah represented a climacteric moment in anti-imperialist and Islamic nationalist politics in West Asia, the emergence in 1990 of Saddam Hussein as a self-appointed leader of Arab nationalism was an anti-climax in the history of contemporary Arab nationalism and its struggle against imperialism.

THE first war of the post-cold war era ended within 100 hours of the unleashing by America and its allies of the ground offensive against Iraq for the recovery of Kuwait. The 39 days preceding the entry of the allied troops witnessed a systematic attempt on the part of the Americans and their allies to destroy from the air the military installations and ammunition factories, security and intelligence apparatus, transport and communications network, civilian power generation plants and waterworks, and the infrastructure of the state consisting of government offices, especially in Baghdad and Basra. The much vaunted pinpoint target accuracy of the 75,000 or so sorties dispatched to accomplish these aims, endlessly touted by the Western media advertising hi-tech warfare as though it were yet another electronic accessory for the living room, did not prevent the destruction of a conservatively estimated 80,000 civilian lives with many more thousands being injured and incapacitated.

The cascade of propaganda ceaselessly pouring out of the media—television, radio and newspapers—on the allied offensive in the Persian Gulf under the leadership of the United States has deliberately and systematically ignored the fundamental and profoundly significant characteristics of the Gulf War. These are quite simply:

NORTH-SOUTH WAR

(1) It is the first war after the world war in which the major powers of the world (with the exception of the Soviet Union), including the only superpower in name and in fact and the two oldest colonial powers, have joined hands to confront and humiliate a single third world country. In the words of a Labour MP in the British parliament, who recently resigned as a Whip rather than support the war, "This is the first North-South war." As a gloss on this, we may briefly note that both the Korean War and the wars of national liberation in Indo-China were East-West wars involving the two superpowers direct-

ly supporting opposite sides until one of them became a protagonist. They were wars in which political ideology (with its economic consequences) played a large role even though the North-South, i.e., the racial, dimension was by no means entirely absent.

Whilst the cold war and the superpower aspects of the Korean conflict provided its initial momentum, its latter phase (marked by China's involvement after America ignored the Yalu River warning) as well as the wars of liberation in Indo-China in their entirety, were fuelled by the major contradiction of the world between the forces of imperialism and the forces of national liberation (i.e., imperialism's implacable foe in the form of the mass of the people living under its domination throughout the world). During the period 1950-75, this major contradiction, to a far greater extent than the major contradiction between the superpowers and their allies which gave rise to the cold war, inflicted physical losses (a total of nearly 1,60,000 American soldiers lost their lives in the Korean and Indo-China wars) on the US.

With an indefinite moratorium declared on the cold war in 1988, we have entered a new era of world politics in which US imperialism believes it can inflict severe punishment on anti-imperialist forces in the third world. As long as the intensification of the major contradiction between the forces of anti-imperialism (whether they manifest themselves as national liberation or as popular movements) and imperialism is characterised by an asymmetry in the strengths of the two sides—the military strength of the one based on superiority of weapons of destruction and the political strength of the other based on mass popular opposition to imperialism—US imperialism and its allies would continue to place their faith in their might and on the support of indigenous elements in control of state power in third world countries with which they can forge close links. Thus the punishment being meted out to Iraq now

is not that due to an ideological adversary but rather to a former client, until only a few years ago lavishly supplied and provided by its imperialist patron, who has now turned renegade. We shall return to this theme later.

DEEPER US DESIGN

(2) The war in the Persian Gulf has galvanised an overwhelming majority of the West Asian peoples, and the Arab peoples in particular, both within and outside the countries belonging to the anti-Iraq coalition. Their mounting revulsion and anger against the physical presence of Western powers and their military forces in the Persian Gulf is obvious despite the fact that the attention given to it in the Western media has been exiguous, to say the least. In other words, the decision of US imperialism and its allies to use Kuwait as a pretext to station well over half a million troops in the Persian Gulf area, with unparalleled fire power, has simply stoked the fires of Arab nationalism and intensified the sparks of anti-imperialism that fly from them.

At the same time, the forces of national liberation represented by the Palestinian people have been left to fend for themselves in the face of the intense repression of the occupying power of Israel, which has made no secret of its regional role as the Zionist foil for the forces of imperialism, armed to the teeth and dangerously aggressive in character. Even after its future security, sovereignty and legality as a nation state have been long guaranteed in the region as well as in the comity of nations, Israel continues to justify its belligerent stance in West Asia by consistently refusing to acknowledge the PLO's change of stance over Israel's future and the former's willingness to separate it from the Palestine question in the interest of carving out a separate state for the Palestinian Arabs.

The Persian Gulf war, therefore, has an underlying thrust that far exceeds its immediate *raison d'être* of liberating Kuwait from Iraq's army of invasion and occupation, or even America's medium-term pre-occupation with safeguarding its own role in the sphere of oil imperialism. It is a complicated manoeuvre, underlined by the enormous lengths to which the allied powers have gone to keep Israel, with the latter's enthusiastic and ungrudging co-operation, out of the mainstream of the war itself—in order to establish a system of power relations in West Asia in which the proverbial monkey (in this case, American imperialism) would be able to exercise control by fulfilling its self-appointed role of doling out justice and equity between the conflicting claims of

ally calls (in this case, Arab states dependent on American imperialism but at odds with one another) in the region. This is an integral part of the 'new world order' recently outlined by president Bush and secretary Baker.

Such a disposition of forces, temporarily threatened by Iraq's challenge to imperialism under the leadership of president Saddam Hussein, would ensure that Israel's pre-eminent position as a military power in the region would be permanently safeguarded. The long-term aim of this war thus relates to the aim pursued by US imperialism and its allies of creating a state of affairs in which the forces of Arab nationalism in general and Palestinian nationalism in particular could be contained by the military and political arrangements that would perpetuate the hraldom in the region of regimes (led by an assortment of feudal-monarchical, comprador and petit-bourgeois forces) dependent on the United States for their increasingly precarious survival in power.

RACIALIST DIMENSION

(3) In the Persian Gulf war, the political and strategic ambitions of Western imperialism have joined forces with a blatantly racist contempt manifested by the Bush administration in particular and the Western powers in general towards the peoples of the region (or for that matter the peoples of any of the regions of the third world who would stand up to imperialism). The Western powers in general and the US in particular have made extensive use of their technological superiority in mass communications in order to launch a propaganda offensive and a psychological onslaught against the Arab peoples—especially for home consumption in the West—with the aim of howing popular movements in the third world in a poor light. The extent to which imperialist arrogance on the one hand, and contempt for those opposed to imperialism on the other, has been internalised in Western societies and has become deeply etched on the psyche of ordinary people during the last two decades or so is evident from the cultural assumptions and subtle distortions in which media representations abound.

To cite only one example from the Western media portrayal of the Persian Gulf War, Iraqi communiques statements and speeches were invariably translated from Arabic into English with the aim of stressing and highlighting apparent exaggerations and absurdities. Such tendentious translation leaves the task of correction to a few conscientious individuals who are given brief appearances in which inaccuracies may to some extent be moved. But, even so, the rectifications

thus introduced are made to appear like glosses on the distortions originally purveyed by the television newscaster of the correspondent somewhere in West Asia. It is also worth noting, in a slightly different context, that the attitude of the Western governments and media towards changes occurring in the Soviet Union has been marked by a mixture of self-congratulatory gloating over the Soviet Union's past mistakes and a feeling of satisfaction at the thought of the uphill task facing the country in such a deep crisis.

At least two other strands of racism in the allied stand and its reporting in the media deserve to be noted. The American president and senior officials of his administration constantly reiterate the distinction between the Iraqi people and president Saddam Hussein, their leader, emphasising that their quarrel is with the latter. This is disingenuous in the extreme. The personalisation of a conflict of such great proportions is an insult to the intelligence of the entire Arab population for the simple reason that Arab nationalism is a well established political phenomenon of enduring significance and cannot be easily circumscribed. The issue of Saddam Hussein's defiance of American imperialism is a vastly subsidiary matter to the anti-imperialist thrust of Arab nationalism, and its strong antipathy towards rulers and governments in the region whose political sympathies lie with the United States. By the same token, the Arab people's willingness to use any leader in the region who happens to have the courage to defy American imperialism is not in contradiction with their disapproval of that regime's domestic policy of repression and tyranny (for which Saddam Hussein's regime has been notorious for nearly 15 years, mostly with the tacit approval of the United States). The humiliation and defeat of Saddam Hussein in 1991 will thus be seen by large numbers of Arab peoples as yet another blow administered by the imperialists to the cause of Arab nationalism, and not as a lesson taught a recalcitrant anti-hero. The exaggeration in the Western media and official pronouncements of the 'Saddam' factor is tantamount to propagating a scarcely concealed excoiation of Arab political aspirations.

The second strand of racism in the allied stand is directly related to the Israeli government's policy towards the Palestinian people in the occupied territory during this war. It is a clear confirmation, if confirmation were needed, of Zionism's racial contempt for the mass of the Arab people. Draconian curfew regulations were enforced and Palestinian Arabs were compelled to live in refugee camp conditions

in their own land under an occupation regime. Yet there was not even a murmur of criticism of Israel from the allied powers or from the Western news media. One might well ask: What future can the Palestinian Arabs expect in president Bush's 'new international order'? Racial contempt for the Arabs is further underlined in media references to the allies, often differentiating between major (i.e. white ones—American, British and French) and 'other' (i.e. Arab) allies, clearly reflecting the nexus between imperial power and its appendages in the region.

ANTI-IMPERIALISM IN WEST ASIA

It is against this background that we are compelled to view the dynamics of the present phase of the conflict in the region. During the last 40 years, anti-imperialist nationalism in West Asia has experienced at least three major moments of critical transition, until the Iraqi leader appeared on the international stage, transformed from his original incarnation as client if not stooge of US imperialism (especially from the time the American president was director of CIA until well into the Iran-Iraq war, in the latter part of 80s) into his new *avatar* as anti-imperialist leader of Islamic revivalism, Arab nationalism and Palestine liberation. It is essential that this sudden and, it should be said, counterfeit attempt on Saddam Hussein's part of appropriate the limelight in hindsight as Arab nationalist leader should be properly understood in order to appreciate the true magnitude and scale of the reverse that Arab nationalism is about to suffer at the hands of US imperialism and its allies.

Persia, under Mossadegh, was the first country in West Asia to appreciate the economic consequences of imperialism and the political factor linking economic dependence and liberation from imperialism. His intelligent and far-reaching attempt to reflect this understanding, initially in a minimal as opposed to a token manner, by passing legislation to bring Persia's (and West Asia's) oil resources under national control, provided the occasion for the first major intervention after the world war by American imperialism in West Asia against a modernising socially conscious nationalist regime with a conscious urge towards independence. The removal of the Mossadegh government served as a prelude to the restoration of the monarchy under which Iran reverted to a privileged pro-American, but nevertheless client, status in international relations. The Shah's regime directed domestic tyranny and repression especially against populist, nationalist and left-wing elements.

The second great moment appeared in the form of Nasser's concrete effort to cut

Egypt loose for the first time from the shackles of imperialism by nationalising the Suez Canal. Nasser was reviled by the French, British and Israeli governments for daring to assert his independence, and here again the long-term economic consequences of his move were viewed as far more threatening than its short-term strategic and political significance. The language used to attack Nasser in the European media in 1956 was more or less identical with that used to denounce Saddam Hussein in 1990-91. The crucial difference between the 1956 and the 1990 crises lay in the disposition of the American government. In 1956 the United States government was not on the side of the Anglo-French-Israeli coalition; in 1990-91, the United States has been the leader of a vast anti-Iraq coalition.

Nasser's policy of recovering the Suez Canal was imbedded in a clear understanding of the nature of imperialism and the military odds that it represented. It was also motivated by a determination to achieve the limited goal of recovering Egyptian territory and a canal system which was situated within it. In other words, Nasser was not embarking on an international adventure by flouting international legal practices and customs which the imperialist powers were well placed to thwart. Nasser's main trump card was his popularity in Egypt as a nationalist leader and as a leader of Arab nationalism outside Egypt in West Asia as a whole.

In the event, Nasser was able to turn military defeat at the hands of the Anglo-French invading forces into political victory. He had the active support of the non-aligned world as well as the Soviet bloc. In the West the United States stood aloof from the actual conflict, whilst evolving a new policy of imperialism in the region to take the place of the old. No wonder then that the relations between Egypt and the United States became increasingly hostile *after* the resolution of the Suez Crisis. In the short run at least Egypt came out of the Suez Crisis as a successful champion of Arab nationalism thus transforming it from an incipient force into a political reality in the region. In the Suez conflict, Nasser was not isolated whereas his enemies were. The strength derived from genuine popularity and the support of political forces outside can hardly be exaggerated in evaluating Egypt's international role under Nasser in moulding a new phase of Arab nationalism.

The third great moment in the contemporary resurgence of Islamic nationalism was provided by the religious opposition to which the Shah's government gave rise. Unlike the post-Farouk Egyptian version

of Arab nationalism and the Persian version of economic nationalism that had preceded it under Mossadegh's government, the anti-Shah movement under Ayatollah Khomeini's leadership was rooted in Islamic religious solidarity in general and Shi'ite solidarity in particular. Its main enemy was American imperialism as reflected in Iranian politics under the Shah's leadership. It pitted nationalism inspired by religion against secularism and economic and political dependence on imperialism.

The hallmark of this new brand of opposition to American hegemony in West Asia was the popular following (indeed mass following) that it evoked and the combining together (if only on a temporary basis) of the entire spectrum of opposition including the 'Mujahedin' elements to American penetration of Iran with the Shah as one of imperialism's powerful cat's paws in the region. It is worth pointing out that by virtue of the international framework within which it gathered momentum and the internal mass support that it did command over a period of nearly 10 years leading up to the overthrow of the Shah, the opposition led by Ayatollah Khomeini was marked by a clear understanding of the nature of imperialism in general and America's hegemonic role as the major imperialist power of the world in particular, and of the *political* weapon that would have to be forged in order to wage a protracted struggle against it.

The Iran-Iraq war, entirely provoked in the first instance by Iraq, could not have come at a worse time for Iran. The United States and its allies were prepared to refurbish Iraq's military force in order to enable it to prosecute its war against Iran, while turning a blind eye to its repression and tyranny against its own people and its policy of genocide towards the Iraqi Kurds. The support extended by the United States to Iraq, especially during the Reagan presidency, was an important factor in the intensification of Iran's internal economic crisis. At the same time, despite the religious excesses of the Imamate, the Iranian people as a whole went through the eight years of war with an understanding of the role played by US imperialism in West Asia and of the role of Iraq, its opportunistic client in the region, the clarity of which remained undimmed despite the enormous privations to which Iran had become subject.

The demise of Ayatollah Khomeini, followed by the emergence of a new tendency in Iranian politics in favour of working out a regime of co-existence with American imperialism, coincided with the declaration of a moratorium on the war with Iraq. At the time the cold war ended,

Iran's internal politics revolved around adjustments between those who essentially favoured a continuation of the trend set by the late Ayatollah Khomeini on the one hand, and on the other a new breed of politicians which favoured a compromise with the United States. The interesting feature of contemporary Iranian politics lies in the fact that both these elements share more or less the same understanding of the nature and role of American imperialism whilst favouring different pragmatic steps to deal with it at the current juncture.

SADDAM HUSSEIN: THE ANTI-CLIMAX

If the victory of the Iranian Revolution over the regime of the Shah represented a climactic moment in the unfolding of anti-imperialist and Islamic nationalist politics in West Asia, the emergence in 1990 of Saddam Hussein as a self-appointed leader of Arab nationalism has acquired the markings of an anti-climax in the history of contemporary Arab nationalism and its anti-imperialist credentials. Quite apart from the fact that he was, in the first instance, US imperialism's choice for the leadership of Iraq and for the projection of its interests in West Asia (where, in the 80s, the United States regarded president Assad, the Syrian leader, as the main impediment in the region), Saddam Hussein's role has been distinguished by three main characteristics. First, his understanding of politics is almost entirely in terms of the brute force of state power which he has never hesitated to use (as indeed is the case even at the present time in Basra against the Shi'ites and against the Kurds in the north immediately after his defeat at the hands of the allied forces) in order to suppress any kind of internal opposition or bully the weaker powers in the region. Second, in stark contrast to the leaders of the Iranian revolution (and the Ayatollah in particular), Saddam Hussein has no understanding whatsoever of the dynamic features of American imperialism and the role that it has assigned itself in the region. Third, his animal cunning and shrewdness are unequally matched by his intelligence and ability to devise an anti-imperialist strategy consisting of a political programme of strengthening mass commitment to Arab nationalist ideology combined with a cautious rearguard action by way of opposition to the technologically immensely superior armed forces of the West.

A complete failure to grasp the nature of imperialism as a global force affecting West Asia combined with foolish military extravagances in the region to highlight Iraq's expansionism, led Saddam Hussein

an unnecessary and debilitating conflict, especially from the perspective of the forces of anti-imperialism. With Iran and Iraq locked in a futile war, the Palestinian liberation movement suffered a series of setbacks, and Israel and Syria continued to contribute to an intensification of the destabilised condition of Lebanon.

Again, Saddam Hussein's invasion of Kuwait was motivated by megalomania rather than a carefully conceived strategy of recovering the integrity of the Iraqi nation by substituting its present coloniality defined boundaries with historically sound ones (i.e. including the '19th province') through popular struggles against the feudal rulers of Kuwait supported by US imperialism and its allies. If Saddam Hussein was unaware of the aid and comfort his adventure against Iran gave the forces of imperialism in West Asia, he demonstrated a monumental ignorance of the enormous political and military cost of provoking imperialist countries by launching a campaign of annexation against Kuwait. The price of this adventure, for which Saddam Hussein bears the sole responsibility, has been not only Iraq's humiliation, further exacerbated by its leader's temporary survival in power, but also a setting back of the agenda of popular mobilisation against imperialism and national liberation with due consequences for the Palestinian people.

For their part, the imperialist powers have succeeded in repudiating the forces that they had encouraged until August last year. This feat on their part bears a remarkable resemblance to Margaret Thatcher's legdemain at the time of the Malvinas/Falklands crisis. As soon as Galtieri's armed forces occupied the Malvinas/Falkland islands, Margaret Thatcher experienced a revelation which brought home to her with blinding clarity the odious fascist and anti-democratic nature of a regime which had presided over the liquidation of civilian politics and had contrived the 'disappearance' of thousands of Argentinians over a previous period of several years! A policy of 'not going wobbly' was justified on the ground not only that Britain was restoring its rights to its colonial possession but also that Galtieri's defeat would provide Argentina with an opportunity to change from fascism to democratic rule.

FUTURE ANTI-IMPERIALIST STRATEGY

The disingenuousness of this kind of reasoning lies in imperialism's readiness to sustain numerous anti-democratic regimes (including Galtieri's own until 1982) until a minor transgression by one of them is punished by bringing the wrath of democracy down on it in the form of

imperialism. At the present moment, Iraq happens to be the state which imperialist countries had equipped with the military power needed to suppress democratic dissent and to embark on an eight-year war against a big neighbouring state. Iraq's leader, who has used every trick in the book to concentrate power in his hands, foolishly believed that it could expand into Kuwait, one of imperialism's remote 'allotments' in West Asia, in a nationalist adventure.

Saddam Hussein's invasion of Kuwait thus becomes yet another moment of blinding clarity for US imperialism when it is suddenly discovered that Saddam Hussein is an inhuman Hitler-like dictator. The fact that he had enjoyed American support for nearly two decades is consigned to some kind of a disinformation limbo of US imperialism's propaganda machine. The dilution of the 'Soviet' factor (with the ending of the cold war in 1988) in Iraq's political alignments merely served to highlight Saddam Hussein's military and political vulnerability and

Union has been shaken down to its roots by the realisation that on the battlefield, its former cold war adversaries had proved themselves to be immensely superior in calibre.

During the last half a century, changes in the structure of power and the course of international relations have occurred in which the masterly understanding of the strengths and weaknesses of imperialism that the leaders of the great struggles for national liberation (in China, Indo-China and in other parts of the third world) brought to battlefields and negotiation tables would appear to have receded into the background, whilst the major contradiction between the forces of imperialism and the forces of national liberation, i.e. between the states of the first world with the acquiescence of the Soviet Union and East European states on the one hand, and on the other, the peoples of the third world continues unabated. The fashioning of a strategy for dealing effectively with imperialism is the great project that faces the anti-imperialist forces of the world today.

New from SAGE Publishers of the Professional Social Sciences

MANAGING RURAL DEVELOPMENT Health and Energy Programmes in India HEIN STREEFKERK and T K MOULIK (Eds)

Rural development programmes invariably have substantial components dealing with public health and energy. However, these two elements have received only scanty attention from researchers. This volume, therefore, fills a critical gap in the literature by providing field-based case studies on rural health and rural energy, by analysing them from the broader perspective of rural development, and by focusing on the managerial implications.

The original essays comprising this book follow an integrated approach not only in terms of analysing the socio-economic and 'political' systems prevalent in rural India but also in terms of an interdisciplinary approach. The contributors reflect two different perspectives—the 'management' approach to rural development, and the anthropological-sociological one.

This volume will be of considerable interest to policy makers, health and energy specialists, sociologists, environmental scientists, and above all, those concerned with rural development.

The Contributors: Kanta Ahuja/Floris Blankenberg/Deepak Gianchandani/Enno W. Hommes/M. S. Rathore/J. K. Satia/Loes Schenk-Sandbergen/Margaret M. Skutsch/Hein Streefkerk/Pieter H. Streefland/Klaas W. van der Veen/Frank de Zwart

Heartland and Borderland

S R Sen

If the contagion of the political upheavals caused by centripetal forces now convulsing the Soviet Union and Yugoslavia should spread to India, the results would be far worse since the divergence between the heartland and borderland and communal and caste tensions are so much more acute in India.

SEVERAL thoughtful experts have recently given a warning that the kind of political upheaval which is currently destabilising two unions comparable to India, viz, USSR and Yugoslavia, may spread to the Indian Union also unless timely and adequate preventive and remedial measures are taken here. Such upheavals are often contagious. Past examples are the spread of republicanism after the French Revolution, the demand for self-determination after the demise of the Habsburg empire, communism after the defeat of Hitler and militantism after the rise of IRA and PLO.

If such contagion spreads to India, it may be even worse than in USSR and Yugoslavia. One reason is that the divergence between the heartland and borderland and communal and caste tensions are much greater in India than in these other two unions.

CENTRIPETAL FORCES

Throughout history, conflict between the heartland and borderland has created serious problems for many federations and unions. Where language, race and religious composition of the people in the heartland and borderland has been markedly different, fissiparous forces have been usually stronger. Where the diversity of the population could be effectively reduced through 'melting pot' measures like development of transport, communication, markets, geographical division of labour, industry, urban habitats, cross migration, cultural and educational exchanges, etc, these tensions have tended to get reduced as in, say, the US or Brazil. But even these countries had to face civil war at one or the other stage of their history. Where, however, linguistic, racial and religious groups have tended to remain concentrated in different regions of the union as in USSR, Yugoslavia and India, inherent fissiparous forces, strengthened by a combination of communal with regional identity and 'sons of the soil' slogan, tended to explode in various ways, after different time-lags, especially if main reliance was put on state power to enforce nationalism and unity as in USSR. In-

terestingly, this trend has been markedly less in a country like Switzerland which has also comparable characteristics but has successfully evolved a constitutional system that promoted co-operative government, sharing of power, mutual accommodation and tolerance.

Among all these countries, the problems resulting from the relative size of the Union and the constituent units and heterogeneity of the population are more comparable for USSR and India. Having less of a command economy, India has perhaps some advantage in regard to possible adjustment through the market. But as against this advantage, there is a special feature which tends to make the problem potentially more difficult for India as compared to USSR.

The three major States, Uttar Pradesh, Bihar and Madhya Pradesh, which comprise the heartland of India, have more

human-power but less money-power than most of the borderland States of the country. But the situation is different in USSR. The Russian Republic, which is the heartland of USSR comparable to Uttar Pradesh in India, dominates all the borderland republics in both human-power and money-power. Yet, in spite of seven decades of intensive planned effort for national integration and command economy for strengthening the hold of the union authorities, several borderland republics of USSR, with much less human-power and money-power than the heartland republic, are now striving for greater autonomy and even secession.

It is, of course, a fact that the complaints of the border States of India against the domination of Delhi, although serious, have yet to reach the explosive proportion of those of the border republics of USSR against the domination of Moscow. The moot question, however, is how long it will remain so. Recent outbursts against the domination of Delhi and the heartland by even elderly and mellowed political leaders of borderland States like Orissa, Tamil Nadu, Kerala, Karnataka, Maharashtra and West Bengal, not to speak of the young militant hotheads of Punjab, Kashmir and Assam, can no longer be ignored. Another cause for concern is that militantism is on the increase more in some of the richer

A National development support organisation based in DELHI needs **EXECUTIVES** for its projects department. We are looking for candidates with a clear understanding of socio-economic development issues in India, and with at least three years experience working in or with grass-root organisations. The selected candidates will be placed either in Delhi or field locations in Andhra Pradesh, Gujarat, Maharashtra and Orissa.

Remuneration package is at the start of the grade for Executives which is 1400-50-1900-EB-60-2500 with DA at Central Government rates, HRA, CCA per Service Rules. Other benefits include 10% PF, GF, LTC, Medical and Children Allowances.

poorer heartland States and secession is easier for the former than the latter. Giving more powers to the police and the army is no long-term solution. After all, the members of these forces are susceptible to the influence of their civilian friends. The solution has to be political and constitutional.

The hard fact is that the militancy of a richer minority can sometimes be a more potent force than the voting power of a poorer majority, when it comes to the question of capturing power through extra-constitutional means. Except for the last hundred years, it is the aggressive minorities who have ruled more often than the passive majorities. Democracy or rule by majority vote has worked successfully in countries where a spirit of compromise and reluctance to push the standpoint of the majority alone to the so-called logical end has generally prevailed. This is a lesson which our populist politicians who seek to capture power by exciting the passions of their respective vote-banks to such an extent that they cannot later make any significant compromise, if needed, would do well to ponder over. 'Every action produces an opposite reaction' is no less true of the political world than the physical world, except that while in the physical world it is equal, in the political world it may be sometimes more than that.

MODERATING ACTION-REACTION SYNDROME

It is a matter of concern that the action-reaction syndrome is in operation both between heartland and borderland and within the heartland. As between the heartland and borderland, over-centralisation of power in Delhi has tended to affect very adversely national unity. Growing resentment among the younger people in the borderland is ominous. Within the heartland, the chain of events which pitted first the OBC vote-bank against the Kulak vote-bank and later the Hindutva vote-bank against the OBC vote-bank has recently weakened very much national integrity. One false step has led to another false step and national unity and integrity are much weaker today than they were four decades back when our Constitution came into force.

The urgent need today is for a revival of the spirit of compromise, readiness to understand the opponent's basic concerns and allay them not merely by words but also deeds and make fair-play the guiding principle for all parties and persons holding positions of authority and power. Justice must not only be done but also seen to be done is not a mere moral principle but also a sound practical political principle.

FORM IIA [(See rule 4A(1))]

NOTICE

It is hereby notified for the information of the public that SUNDARAM FINANCE LIMITED proposes to make an application to the Central Government in the Department of Company Affairs, New Delhi, under sub-section (2) of section 22 of the Monopolies and Restrictive Trade Practices Act, 1969, for approval to the establishment of a new undertaking to render Financial Services. Brief particulars of the proposal are as under:

- | | |
|---|--|
| 1. Name and address of the applicant | Sundaram Finance Limited 21 Parullos Road, Madras 2 |
| 2. Capital structure of the applicant organisation | Authorised Capital : Rs. 25 cr. Subscribed & Paid-up Capital : Rs. 12 cr. |
| 3. Management structure of the applicant organisation indicating the names of the directors, including managing/wholtime directors and manager, if any | The company is managed by the Managing/Joint Managing Directors under the supervision and control of the Board of Directors. <u>Board of Directors</u> Sri T S Santhanam, Chairman " S Viji, Vice-Chairman " N F S Raghavachari " R K Seshadri " S Narayanan " S Rani " S Padmanabhan " T Ramabhadran, Managing Director " G K Raman, Joint Managing Director " S Raghavan, Joint Managing Director |
| 4. Indicate whether the proposal relates to the establishment of a new undertaking or a new unit/division | New undertaking in the name of Sundaram Finance Services Limited |
| 5. Location of the new undertaking | Headquarters Madras |
| 6. Capital structure of the proposed undertaking | Authorised Capital Rs. 10 cr Subscribed & Paid-up Capital Rs. 2 cr (proposed) |
| 7. In case the proposal relates to production, storage, supply, distribution, marketing or control of any goods/articles, indicate (i) Names of goods/articles (ii) Proposed licensed capacity (iii) Estimated annual turnover | Not Applicable |
| 8. In case the proposal relates to the provision of any service, state the volume of activity in terms of usual measures such as value, income, turnover etc. | As per anticipated projections, the annual gross income is estimated at Rs. 212 lakhs in the 1st year and proposed to be increased to Rs. 420 lakhs in the 5th year. |
| 9. Cost of the project | Rs. 8.00 cr |
| 10. Scheme of finance, indicating the amounts to be raised from each source | Equity Capital Rs. 2.00 cr Rupee loans from Banks, Institutions, public deposits and promoter loan Rs. 6.00 cr Rs. 8.00 cr |

Any person interested in the matter may make a representation in quadruplicate to the Secretary, Department of Company Affairs, Government of India, Shastri Bhavan, New Delhi, within 14 days from the date of publication of this notice, intimating his views on the proposal and indicating the nature of his interest therein.

Dated this 9th day of May, 1991

For SUNDARAM FINANCE LIMITED
S VENKATESAN
SECRETARY

The three measures recommended in two earlier articles, 'Electoral System: Urgency of Basic Reforms' (*EPW*, February 2) and 'Reforming Our System of Government' (*EPW*, March 2), viz, (i) implementation of the recommendations of the Commission on Centre-State Relations, (ii) Amendment of the Representation of People's Act, especially adoption of a system of interdependent joint electorate, and (iii) amendment of Articles 74, 75 and 164 of the Constitution for facilitating a co-operative system of government are undoubtedly essential. But that would not be enough.

UNDUE DISPARITY IN SIZE OF STATES

There is an urgent need to look carefully also at the problems created by the great disparity in the size of our States.

At the time of independence, India had nine big provinces and over 500 princely states, most of which were very small. As a result of the efforts first of Sardar Patel and later by the States Reorganisation Commission, the number was reduced to 16 States, most of which were of broadly comparable size, except Uttar Pradesh which had about 60 per cent larger population than Bihar, the next in size. There was a proposal to divide Uttar Pradesh into two States but that was not acceptable to the leaders of the State. Subsequently, as a result of various political pressures, nine other States were created, most of which were very small.

Today, in the heartland of the country, Uttar Pradesh has a population of 139 million, Bihar 86 million and Madhya Pradesh 66 million. Among the borderland States, having access to the sea, Maharashtra has a population of 79 million, West Bengal 68 million, Andhra Pradesh 66 million, Tami Nadu 56 million, Karnataka 45 million, Gujarat 42 million, Orissa 32 million and Kerala 29 million. These eight maritime States contribute over 80 per cent of the Union government's revenues, a substantial part of which is spent in the other 17 States. Other important borderland States are Rajasthan, having a population of 44 million, Assam 22 million, Punjab, 20 million, Jammu and Kashmir-8 million, and Himachal Pradesh 5 million. Seven of the smallest States having less than 2 million population each are Manipur 1.8 million, Meghalaya 1.8 million, Nagaland 1.2 million, Goa 1.2 million, Arunachal 0.9 million, Mizoram 0.7 million and Sikkim 0.4 million.

DISPARITY IN POWER BETWEEN STATES AND DISTRICTS

Many of the districts in the bigger States have populations exceeding 2 million. Cities like Bombay, Calcutta and Madras each has a population exceeding

10 million. But all of them have very much less power than the smaller States. They are resentful that although they have much higher level of population, development, income and education than the smaller States, they are so deprived.

The Commission on Centre-State Relations has observed that the importance of developing adequate sub-State level political institutions cannot be overemphasised. It is only by providing an opportunity to the people that they can be trained to shoulder responsibilities in a system of self-government... For a variety of reasons... these institutions have been allowed to stagnate. Election to these bodies have not been regularly held and often they remain superseded for long periods... Since... there is a general tendency towards greater centralisation of powers, there is special need in a country like India for a conscious and purposive effort to counter it all the time. There is considerable truth in the saying that undue centralisation leads to blood pressure at the Centre and anaemia at the periphery. The inevitable result is morbidity and inefficiency. Indeed, centralisation does not solve but aggravates the problems of the people.

It is obvious that these two kinds of gross disparities, (i) in size as between the big and small States and (ii) in power as between small States and larger districts and cities, cannot be continued much longer in future without creating very serious strains and stresses in our polity. With the high rate of growth of population during the last four decades, the population of States, districts and cities have all more than doubled.

So far as the larger States and cities are concerned, diseconomies of size are increasingly outweighing the economies of size every year. They are bursting at the seams and facing continuously worsening social problems. Whatever corrective action is taken in the usual bureaucratic way is always too little and too late. No effective remedy of this can be ensured without drastic political action, at least once every 15 or 20 years, for devolving greater power to successive lower levels of government, and readjusting the size of States and districts and reorganising or dispersing urban habitats.

SOME REMEDIAL MEASURES

The Commission on Centre-State Relations had recommended in 1987 amendment of Article 5 of the Constitution to enable greater devolution of powers to the local governments. But some State governments were reluctant to devolve power and opposed this, although they were themselves pressing the Union government to devolve more powers to States.

In 1989 the Congress(I) government submitted two bills to parliament to amend Article 5 and devolve more powers to the Panchayati Raj institutions and

powers of the State governments. These bills were passed duly by the Lok Sabha but failed by a very small margin to get the requisite two-thirds majority in the Rajya Sabha.

Early in 1990 the National Front government proposed revised bills for the same purpose but without diluting the powers of the State governments. But neither it nor the Janata Dal(S) government that followed gave sufficient priority to the matter and the bills lapsed with the dissolution of Lok Sabha in March.

But early action in this direction is very urgent in view of the growing discontent within the States. It is hoped that the next government will give high priority to the matter after the ensuing general election.

Recently, the Bharatiya Janata Party has put forward a very bold proposal that the number of States should be increased from the present 25 to 100, each State containing no more than 4 or 5 districts. This is a proposal that deserves earnest consideration of all parties and can be passed relatively easily by a simple majority of votes in the Lok Sabha and Rajya Sabha under Article 3 of the Constitution. If enacted, it will by one stroke solve problems arising from the great disparity between the sizes of States and from heartland versus borderland tensions and meet effectively demands for new States like Bodoland, Gorkhaland, Jharkhand, Uttarakhand, Ladakh, Jammu, Bastar, Vidarbha, Telangana, etc. It will help diffuse growing militancy in different regions and reduce the diseconomies and inefficiency caused by unduly large size. There will no doubt be some additional cost but that can be kept within reasonable limits by providing for common governors, high courts, public service commissions, accountant generals, armed police, etc, for groups of States and limiting the size of State Councils of Ministers by amending Article 164 of the Constitution as suggested in the article 'Reforming Our System of Government' referred to earlier. New problems of co-ordination, if any, can be sorted out by strengthening the present zonal councils. Any objection on the ground that it will go against the principle of 'one language, one State' can be met by the argument that such a basis has never been accepted by our Constitution and languages like Hindi and Bengali comprise more than one State each even today.

It is hoped that soon after the general election, early action will be taken in parliament to enact all these measures, which are really complementary and by no means alternative to one another. That will be the best safeguard for protecting the Indian Union against the possible contagion of the political upheaval of the type that is today ruining USSR and Yugoslavia.

Crisis in Theory

M Shugenne

Environmental Issues in Agricultural Development edited by H Ramachandran; Concept Publishing Company, New Delhi; pp 176, Rs 160 (hardcover).

THIS book is a thoughtful guide to many of the problems intrinsic to the current model of capital-driven, crisis-ridden, agricultural production. The most salient observation on the crisis is offered by M V Nadkarni, an economist, in the second chapter of the book: No economic model has yet to express the complex interconnections, local-global, upstream-downstream, class-divided, state-supported. It's not just a crisis of polluted and depleted air, water, soil, and souls; it's an epistemological crisis, a crisis of knowing. Books which struggle to theorise the new ecological phenomena tend to engage in one of two very different discourses, asking two very different questions. Either what would the market price of pesticides be if one incorporated the full range of social and ecological costs which occur in its production and use, in the factories and the fields? Or, what would the political price be if one incorporated the people's right to know and participate in the calculation of such costs?

The second scenario is the wall which activists face today (in Narmada, Bhopal, Tehri, etc), yet it is most conspicuously absent from this book's debates. The first scenario is discussed fruitfully, so let's start there. Implicit in the first question is that the people should bear 'total' costs at the time of purchase or exchange. Perhaps society would become more prudent and far-sighted in the use of its productive inputs, such as pesticides and water, if it had to pay, upfront, for all the downstream, long-term costly effects.

The authors collectively ask, consciously or otherwise: How do we manage the current crisis in agricultural development? The editor has gathered together studies which attest to devastating pollution and depletion, contradictory economic growth and increasing poverty. (Absent from this overlapping list of social malaise is 'social unrest'.) The texts scan the Indian map of large-scale irrigation schemes—from Andhra Pradesh's Krishna Delta to Karnataka's Krishnaraja Sagar. Over time, all cases are experiencing trouble, simply described as depleted soils and lower yields. "In a commercialised setting", the summary introduction asks, "how do we encourage resource use practices that involve lower personal and immediate return than the cost involved, though social and/or long-term costs may be higher?" (p 35)". This question reverberates through most of the authors' arguments; it is based on a 'rational

actor' scenario where if only 'the farmer' knew the consequences of his/her actions, he/she would stop overwatering, overfertilising, and in essence, stop externalising the private costs of production. But isn't it 'irrational' to assume that either the small indebted farmer or the agro-capitalist could/would stop exploiting, because it was unsustainable?

Traditional political economy has much to say about the systemic traps of capitalist agriculture, but practically nothing about two very real dimensions of India's agricultural development: struggles over the environment and public space. This book attempts to integrate the first without the second; thus, it fails to speak to the concrete situation the rural majority faces—an eroding natural resource base and an eroding knowledge and power base. The most revealing facet of the latest cycle of mega irrigation and dam projects is the complete lack of information at the grassroots. Nobody knows what is coming or what is going. For example, MP tribal farmers were not told their land would become a Narmada dam reservoir until years after the plans were formalised; while Gujarati dry-land farmers publicly insist they will receive Narmada water, original studies show this to be mathematically impossible. To brand activists as 'anti-dam' or 'anti-development' is wrong; if at all, they should be branded 'anti-theft'. In Madhya Pradesh, Amazonia, and San Francisco, social movements are taking to the roads to protest all moves by the state to strip local and regional communities of their control and management, of local resources—their labour, their natural resources, their power and knowledge. In trying to theorise the interconnections between economy and ecology, we fail unless we also theorise the concomitant struggle over local control.¹

Nadkarni's chapter, 'Agricultural Development and Ecology—An Economist's View' offers a provocative, albeit partial, three-pronged framework to analyse agricultural problems that stretch over disciplinary boundaries of economics, ecology, and sociology: negative externality, sustainability, equity. As Nadkarni presents it, negative externality in agriculture is not as easily measured as in industry; if the pulp mill smokestack overpollutes, the state can measure and regulate its outflow at the stack. In agriculture, however, it is difficult to know which farmers are polluting the water supplies with

pesticides and which labourers are being slowly poisoned. "A direct consequence of this is that, pesticides being cheaper than their social cost, there is no stimulus to reduce their use and adopt a safer technology" (p 24).

From externality, he moves to sustainability: "Even if a paper and pulp mill satisfactorily controls pollution, the depletion of forest resources that it causes would still continue" (p 26). This concept incorporates the interests of future generations, by adding to the model various costs of regeneration. Finally, he comes up against the problem of equity: All these problems of erosion, depletion, and contamination impact the poor more so—even the burden of managing the deteriorating commons falls unfairly upon their shoulders.

Yet solutions are found within the confines of 'rational' modelling—dependent upon a scientific measuring system of costs and benefits which creatively incorporate ecological inputs, but ignore the primary problematic of power. What are the rural-urban, local-regional, national-international interactive tensions which help manifest seemingly irrational decisions with both New Delhi financial managers and UP village field managers?

To move beyond the economicist model to understand the ecological crisis in Indian agriculture, it may prove instructive to look more closely at the specific conditions of production which are currently being depleted, polluted, and expropriated. These conditions can be conceptualised in three categories: natural resources, human labour, and the public space in which they interact (uncommodifiable infrastructures and places such as markets and town squares). None of these conditions can be produced by capital—not by factory nor by mill. Instead, they are accessed, shaped, and readied for labour and resource markets by the state. No individual capital is capable of building a dam, rerouting a river, transforming dune desert soils. Similarly, no individual capital is capable of transforming land, forest, and water-managing peasants into a wage-labour (or sharecropping) dependent body.

Only the state is capable of organising resource and labour markets—robust with subsidised land, water, and infrastructural supplies (the resource market) as well as a highly dependent rural poor (the labour market), readied for large-scale capital-driven, capital-dependent agriculture. The Indian state can only do so with the guidance of international finance. The power relations in this global-local entanglement, however, are not completely unidirectional. Crisis emerges for the rural poor as many sell off their land and become labourers (one of many existing scenarios); at the same time, local nature-society relations begin to break down. Now, who is to

manage the forests, woodlots, groundwater supplies? Under what revised conditions of power—if cash-cropping for debt-servicing is the predominant mode of survival for the Indian small farmer?

Spatial configurations are also being degraded—whether it is clogged sewers, contaminated drinking water, or fragmented relations within the household and the village. Rajasthan farmers along Stage II of their \$ 3 billion canal have been settled in 'chaks' named 1Lkd, 5Lkd, and so on, living in isolated 'dhanis', without schools, roads, or health facilities. Where is the village square in which they can sit and discuss common problems?

The degrading of these three local conditions—nature, labour, and public space—can create an underproduction crisis which has a tremendous vertical impact. Having borrowed extensively from international capital to construct these systems, India becomes more dependent upon foreign capital and its power constraints. In turn, international capital and the Indian state combine to require from India's labour and resources more extractive, more intensive, more exploitative productive relations; how else could India expect to produce hard currency? The largest irrigation scheme, the biggest dam project, the most capital-intensive cropping system, will not save India from these pressures; on the contrary. Capitalism is dependent upon healthy conditions of production yet necessarily pollutes/depletes/exploits them. This is the contradiction which creates, before our eyes, local environmental crises.

Hence, the environment becomes a very politicised terrain. The globe as a privatised, commercialised commons, is a new material and symbolic phenomenon for which new theoretical debate is needed. Why does the state not involve communities in open debate about the best use of the river, the pasture land, the soil? Why does the state specifically not engage in public discussion about the local dam, canal, or resource extraction industry before it is designed, financed, and constructed? In spite of 1966 FAO soil surveys warning of a future of high salinity and waterlogging, not a single farmer allotted land along the Rajasthan Canal has been informed (as of 1990). Now, whole villages have been displaced by a spoiled ecosystem in Stage I (Ganganagar district) and a recent government-sponsored study (not available to the public) shows up to 40 per cent of Stage II (Bikaner district) will be destroyed once settlers start their high-water consuming groundnut and wheat cash-cropping. Have any of the farmers who have left their villages to settle along Stage II been forewarned?

Waterlogging is the most prevalent problem found in the book's case studies; this is easy to document. The hard-to-measure factors, involving relations over local resources, are avoided. In fact, it is a fluid tension for which no static economic model can be found. The one factor which most

clearly connects most of India's new social movements is the struggle over control over community resources—yet, it is the most difficult to articulate. This book, like the current social situation, finds itself trapped within these real and epistemological boundaries.

Coming back to the empirical questions this book pursues: Why are dominant forms of pest-management poisonous? Why does irrigation waterlog and over-salinate? Why are common lands and their management traditions eroding? Why is there less drinking water, more waterborne disease cases, lower yields and more debt? These questions can be best answered within a theoretical framework which analyses the loss of local control of natural resources (nature) and village life (social labour) in a regional and international context. There is nothing inherently problematic about a dam, pest control, or organised large-scale farming. The problem lies in the increasing concentration of power over agriculture (and everything else), such that rivers, soils, forests, and those who know and maintain them, become mere, but essential, inputs into state-facilitated capital accumulation. A far more revealing question to ask is: Why is the state borrowing millions to build infrastructures which eventually funnel India's

resources (human and natural) into national capital markets?

Finally, what is the ecological impact? It is at this point where the authors focus their analytical framing; these case studies are significant contributions which reveal the region-by-region specificities of this nationwide crisis. Ultimately though, they approach their cases too far submerged in the muck of 'development' contradictions to be able to collectively articulate a theoretical basis for understanding India's ecological crisis. Studies on the effects of development is what we are left with, a post-development wrap-up of the damage done. Meanwhile, communities and their resources become further fragmented; contractors continue to build; hunger strikers lose their stride.

Note

1 The 'conditions of production' debate is informed, albeit insufficiently, by an ecological Marxist theory as being developed by James O'Connor, University of California at Santa Cruz, and being elaborated internationally in a new journal, *Capitalism, Nature, Socialism: A Journal of Socialist Ecology*. Sliding-scale subscriptions are available through Guilford Press, c/o the Distribution Centre, Blackhorse Road, Herts, SG6 1HN, Great Britain.

'Gender Makes the World Go Round'

Meera Nanda

Bananas, Beaches and Bases: Making Feminist Sense of International Politics by Cynthia Enloe; Pandora Press, London, 1989; pp 200, \$ 11.95.

THE global assembly line, (wo)manned by the new proletariat with "nimble fingers and docile demeanour", has been the mainstay of the new international 'division of labour'. When multinational corporations flee from high wage Western countries to sweat shops in the Third World, gender roles are 'relocated' together with jobs. The same monotonous, dead-end, ill-paid jobs, open to the majority of women workers in the West, end up being performed by their third sisters for even lower wages and fewer benefits.

Bananas, Beaches and Bases goes beyond most feminist commentaries on this subject by examining the gendered nature of the political arrangements between the powers-that-be that ensure capital's global reach. Cynthia Enloe, a pioneer in providing a feminist understanding of the lives of women workers in the global economy, attempts to show in her recent book how the "conduct of international politics has depended on men's control of women".

Separate chapters examine the political pillars supporting the edifice of international economy: 'Diplomatic Wives' lays bare the mechanisms through which conventional ideas about femininity and women's unpaid work—as loyal and self-effacing, companions, care-givers and hostesses—are

manipulated by the state to establish political and commercial links with other states through diplomacy; 'Bases' extends the argument to the enforcement of the world order through military means. 'Nationalism and Masculinity' examines the male biases that afflict the forces aligned against the global capital and destroy their potential for creating a genuinely equal society.

The rest of the book revisits the Third World women toiling in banana plantations, garment industries and the burgeoning 'service sector'—mostly tourism (including sex tourism) and domestic services (nannies and maids) for clients from affluent countries. The focus on the service sector is a useful corrective to the disproportionate attention Third World women workers in formal, industrial sectors like textiles and electronics have received in the past. It brings home the fact that a number of debt-ridden Third World countries, with advice and encouragement from international financial institutions, have begun to use women's very being—their bodies, their emotions, their abilities as care-givers—as a 'natural resource to compete in the international market'.

Enloe asks one basic question of each scenario that she examines: Where are the women? Through interviews, historical anecdote

individual experiences, she leads the reader to the central paradox. Though 'gender makes the world go round', it remains invisible, a part of the 'natural' order of things. The international political and financial system relies on women's labour "as feminised workers, as respectable and loyal wives, as 'civilising influences', as sex objects, as obedient daughters, unpaid farmers". Yet it refuses to acknowledge this reliance. It denies any voice to women's experiences—of war, marriage, trade, prostitution, factory work, domestic chores—in defining its ends and choosing its means.

How can something so central be rendered invisible? Enloe's answer is that 'international is personal'. International finance and politics rely upon private relations between men and women defined by the patriarchal conventions of masculinity and femininity. Only an unquestioned equation of risk taking and enterprise with 'manliness' and docility and acceptance of authority with 'feminine virtues' can make the gender inequalities in international affairs seem 'natural', taken for granted and invisible. Our brave new world needs the cover of age old patriarchy for its survival. From this vantage point, Enloe proceeds to ask 'feminist questions' in order to "make women visible" in the international political and economic order.

Women in most societies, for instance, are assumed to be 'naturally' good at cleaning, washing, cooking and serving without expecting any wages. (Don't they do it all the time at home?) How else can be explained this strange phenomenon that even in countries with rampant male unemployment, an overwhelming majority of chamber maids (75 per cent in the Caribbean, 80 per cent in China, both during the late 1980s) and domestic servants are women? International hotel industry—the new plantation—keeps its costs low simply by defining its lower end jobs as 'women's jobs'. Immigrant women, forced to leave their own children and families behind to find jobs as nannies and servants in rich countries in the West and the Gulf, have become the largest single source of foreign currency for the Philippines and Sri Lanka. Enloe connects the swelling ranks of women in hotels, brothels and affluent households to the politics of external debt that makes earning hard currency the top priority of debtor countries.

Exploitation of conventional notions about women's 'natural' station is not limited to Third World businesses and governments. In a rather unusual look at the wives of diplomats, Enloe reveals that till 1972 when 'diplomatic wives' organised and forced the state department to change its rules, they were officially considered adjuncts to their husbands. They were prohibited from pursuing careers of their own and were expected to work without pay to create a social atmosphere conducive for diplomacy.

Enloe's most striking—and the most

national relations involves the most naked control of colonial and post-colonial Third World women's sexuality. The US government's insistence in the late 1960s that the Philippines government tests for AIDS all women providing sexual services to the US servicemen stationed in that country, bears an unmistakable similarity with the 'Can tonment Act' the British passed a century ago, demanding compulsory genital examination of Indian women around imperial military bases.

Enloe provides a very readable analysis of the gender inequalities that lie at the heart of the modern day world system. Wisely, she prevents the reader from despairing by interspersing her narrative with instances of women uniting locally and globally to challenge their oppression. Her faith that "Nothing is natural" what has been made can be made suffuses the entire book with a very welcome optimism.

Yet, the book is not without serious shortcomings, both in its thematic content and in its style. One major problem is that Enloe never defines what she means by international politics and how it relates to international economy. She moves from politics conceived variously as statesmanship, as imperialism (and its neiness, nationalism), as military might and as immigration policies. Furthermore she looks at the role gender plays in all these forms of politics at levels ranging from sexist assumptions (e.g. women as dependents and care givers), lack of equal opportunity (e.g. in foreign services), state policies that encourage overt sexual coercion (e.g. sex tourism and prostitution) and create a disposable workforce (e.g. in garment industry and agribusiness).

Taken separately, no one can deny the validity of all these political processes and gender inequalities. But a struggle against these injustices requires a more complex

of reality together. Enloe's lack of attention towards theoretical detail leaves the reader with no lasting or deeper understanding about women's struggles but only with moving details and anecdotes.

The book's lack of rigour is reflected in its brand of populist feminism. For too long international affairs have been assumed to be gender neutral. But that does not warrant that gender should now displace all earlier categories of analysis, irrespective of their validity and usefulness. Enloe tends to do exactly that. At one point, she equates 'risk taking' with a 'masculinised conception of banking'. The reader is left wondering what a feminine conception of banking would be.

So concerned is Enloe with supporting her thesis that 'gender makes the world go round' that she does not even acknowledge the classical problems of feminist analysis. For instance, while men call the shots in world affairs, it is important to recognise that masculinity is not exempt from manipulation for the sake of profits and political aims. Having to live up to images of 'warriors' and 'bread winners' places enormous burden on men too. Moreover, Enloe places too much faith in the 'international sisterhood' for winning justice for Third World women. But classes and national differences cut right through the sisterhood. Carla Hill, the US trade representative, and the women at the receiving end of the trade policies she works out, do not have identical interests determined by their shared gender. The book does not deal with these problems with placing gender alone at the centre of international politics and economics.

For all these limitations, any one looking for a readable, popular overview of the state of women in the world affairs will certainly find *Bananas* satisfying.

Poverty and Income Distribution

Edited by

K S Krishnaswamy

While there has been over the years a perceptible increase in per capita income and expenditure and possibly some decline in the incidence of poverty in India what still remains is massive and of a kind that is not remedied quickly or smoothly. Even with radical policies the shifts in income and occupational structures to make a serious dent on it will take more than the rest of this century. In the welter of recent exchanges between the government and the opposition as well as between planners and market advocates on the strategy of growth these issues have been largely obfuscated. It is therefore more than ever necessary today to recognise the magnitude of the problem and the inadequacy of the measures adopted so far to deal with it.

Export Promotion, Exchange Rates and Commodity Prices

V Bhaskar

The collapse of primary commodity prices in the 1980s has been prolonged and has severely affected many developing countries. While low commodity prices can be partly explained by sluggish demand due to slow growth in the industrialised countries, high interest rates and technological change, this does not seem a complete explanation.

This paper examines the evidence in favour of the hypothesis that supply factors have partly been responsible. Many developing countries have faced severe balance of payments difficulties, in part due to the debt crisis, and have resorted to real exchange rate devaluations in order to boost export earnings. Such devaluations may have boosted export supplies, or prevented downward adjustments in capacity, and therefore put pressure on commodity prices. It also considers the policy implications of this externality, whereby attempts to boost export earnings in one primary producing country adversely affect the prices received by others.

I

Introduction

THIS paper is a study of primary commodity markets, focusing in particular upon the supply side of such markets. The commodity crisis of the 1980s has been prolonged and painful for most developing countries. Primary commodity prices have been at an all time low, and most forecasts indicate that they are likely to continue to be depressed in the medium term. While demand factors have played an important role in keeping prices low, this paper evaluates the hypothesis that low prices are in part due to excessive supply, or at least the failure of suppliers to adjust capacity downwards in the face of a decline in demand. The 1980s have seen a period of acute balance of payments difficulties for many developing countries, in part due to the collapse of commodity prices but also due to other factors such as the debt crisis, and many countries have been forced to undertake real exchange rate devaluations and boost export supplies. From a policy perspective it is important to find out whether such policies have themselves contributed to the commodity and balance of payments crisis by causing over-supply in commodity markets. This paper considers the evidence in favour of such a proposition, and focuses in particular upon the negative externality whereby increases in supply potential in one country have adverse consequences for the prices received by others. Such interdependence between producers can have important implications for policy. This is particularly the case for policy advice offered by international institutions, since they can exert leverage upon a number of developing countries simultaneously. If such externalities are important, a case can be made for such institutions to internalise these considerations in their policy advice.

In this version of this paper we omit some

of the more technical discussion, particularly that relating to econometric issues; the interested reader may refer to Bhaskar (1988) for a more comprehensive discussion of such issues. The paper consists of four sections. In Section II we examine the reasons for the current slump in commodity prices, and assess the evidence in favour of the proposition that debt-service effects are important in explaining the behaviour of prices. On balance, there seems to be some evidence in favour of this hypothesis, although a categorical answer is not possible. In Section III we examine a single commodity, tea, in order to assess the responsiveness of supply to price incentives. This is in order to see whether exchange rate depreciations have had an impact on supply. The evidence in this case does not seem very positive. Supply elasticities are generally low, and it does not seem that excess supply is due to policy-induced supply expansions. The weakness of demand seems more important. In this context, we find that the major source of demand expansion is from the developing countries, since the income elasticity of demand for tea is somewhat greater at lower levels of income. This implies that the current debt crisis and balance of payments difficulties of many developing countries may be affecting tea producers in a somewhat different way, by keeping demand depressed. Since this shape of the income elasticity schedule may also apply to other primary products, this factor may have relevance for other commodities as well. In Section IV we take up the problem of excess supply from a different angle. If real exchange rate developments have created problems of excess supply generally in commodity markets, it must be the case that they must be important in the major commodity producers. We consider the largest commodity exporters, i.e. the indebted Latin American countries and the South-East Asian producers, and ex-

amine their real exchange rate movements. We find evidence for real depreciations among these countries, particularly among the most important producers. Trends in real exchange rates also indicate a tendency to depreciation of late among those countries which have not done so earlier. This suggests that excess supply in commodity markets may persist into the future, since such depreciations make downward supply adjustments less likely. In the final section we examine the policy implications of such interdependence among commodity producers. Since international agencies such as the IMF or the World Bank deal simultaneously with many developing countries, we suggest that such considerations should be internalised in the policy discussions, if policies are to be appropriate for the countries taken as a whole.

II

Commodity Prices in 1980s: A Possible Explanation

The terms of trade of primary commodities have been a central issue for developing countries. Concern has focused both upon the secular tendency of the terms of trade *vis-a-vis* manufactures, and upon the short run variability in primary commodity prices, with the UNCTAD proposals for primary commodity price stabilisation being aimed at solving the latter problem.¹ The issue of the terms of trade was sharply posed by Prebisch (1962) and Singer (1950), with the argument that there was a secular tendency for the terms of trade of primary products to deteriorate, due to their low income elasticity of demand. This tendency could also be accentuated by monopoly power in product and labour markets in the developed countries. These arguments and the ensuing controversy, as well as the

by Sapsford (1980), and more recently by Sapsford (1985) and Sarkar (1986). The events of the 1970s, with the rise in oil and commodity prices and concern about the exhaustibility of resources and the consequent "limits to growth" seemed to banish these concerns. However, the events of the 1980s have brought these questions back into focus, and sharply indeed. A new acute phase in the decline of real commodity prices began with the international recession of 1980-82 when output fell in the OECD countries, and the price index of 33 primary commodities (excluding energy) relative to the price of manufactured imports fell by 32 per cent. More importantly, this decline was not reversed by the economic recovery which ensued in 1983. Although OECD output growth has been 3.2 per cent per annum in the years 1982-86, the customary link between developed country growth² and commodity prices seemed to have snapped. Real commodity prices in 1985 were below their 1982 level and were in fact at their lowest since the World War. Low commodity prices have been extremely favourable for most industrialised countries—not only have they ensured improved terms of trade and higher real income, they have also played a crucial role in bringing about the decline of inflation in OECD countries to the lowest level in 20 years (see Beckerman and Jenkinson, 1986). However, the problems for developing countries who are dependent upon these exports have multiplied.

The nature of trends in commodity prices may be discerned from charts 1-5. These charts show the movement (up to 1987) of an index of commodity prices in real terms, and are derived by deflating the commodity price in dollars by the index of industrial country export unit values in dollars. Chart 1 shows the development of the index of 33 commodities (excluding energy); the sharp decline in 1980 is followed by a minor recovery in 1983, but this soon collapses. Chart 2 shows the behaviour of the index of food; here the collapse of the mid-1980s is even more pronounced. A similar feature can be noticed in Chart 3, for beverages. The trend in raw materials is somewhat better, with a hint of a recovery in prices in the recent past (see Chart 4). The index of metals (Chart 5) also shows a substantial decline though there has been a partial improvement in prices of late. It must be pointed out that the recent recovery in commodity prices has been extremely limited—real prices in December 1987 were still 20 per cent below their average level of 1980-84, and the latest (1988) IMF World Economic Outlook forecasts that future prices are likely to stabilise the levels of early 1988.

Before proceeding to a discussion of the econometrics of commodity prices, it might be useful to outline the major developments in the international economy in the 1980s which impinge upon commodity markets. The early years of the decade were marked by a severe recession in the industrialised coun-

tries, monetary policies which were aimed at reducing inflation. Between 1979 and 1982, output in the industrialised countries grew at less than 1 per cent per year, as compared to 4 per cent in the period 1976-79. The effect of slow growth on commodity markets was compounded by high interest rates—short-term rates were up to 7 per cent greater than inflation in the early 1980s, and real rates have remained extremely high since, at about 4 per cent. This may be contrasted with the negative real rates which characterised most of the 1970s. These high interest rates, which were an important inducement to reduce commodity stocks, were mainly due to the pursuit of a restrictive monetary policy by the United States in conjunction with a huge fiscal deficit. These policies also resulted in a huge appreciation of the US dollar, which rose by almost 60 per cent between the end of 1980 and early 1985. Subsequently this appreciation has been reversed, although the budget and current account deficit of the United States persists, putting pressure on interest rates world-wide. Since much of developing country debt was dollar denominated, the rise of the dollar and interest rates resulted in a big increase in the debt burden of borrowers, causing the crisis of 1981-82. Since then, the indebted countries have been forced to implement austerity policies to reduce their imports and augment exports in order to service their debt. One way of earning more foreign exchange has been through real exchange rate devaluations—the latest (1988) IMF World Economic Outlook documents that real exchange rates in the developing world today are substantially depreciated in relation to the past. Since the balance of payments difficulties of the developing world are far from over, these policies seem set to continue in the near future.

A central question in understanding commodity markets is an explanation for the collapse of commodity prices in the 1980s, and for the failure of prices to recover even when output growth improved in the OECD countries. The favoured method for analysing the determinants of commodity prices remains econometric, and it is on econometrically estimated commodity price equations that we focus upon in this section. A key fact regarding such econometric equations is that most estimated equations have turned out to be unstable in the 1980s, predicting real commodity prices substantially higher than actually materialised. This has been reflected in the fact that most price forecasts emanating from international institutions such as the OECD, the World Bank or the IMF have consistently overshot actual performance. Indeed, a recent study by Warr (1988) finds that the World Bank's commodity price projections are not statistically efficient and overpredict prices for a number of commodities.³ This appears to be related to the effect of exchange rate fluctuations upon real commodity prices. With the rise of the dollar in the first half of the decade,

initially, while this is not in itself surprising, since a rise in dollar value may be expected to raise commodity prices in terms of say German marks while reducing it in dollar terms, without any major effect upon the index in terms of a weighted average of industrial country export prices, the surprising thing is the magnitude of the negative effect. Dornbusch (1985) found the elasticity of the dollar commodity price with respect to the dollar value to be -1.5 , while Beenstock (1987) finds an elasticity of -1.4 . This implies that a rise in dollar values reduces real commodity prices not merely for the United States, but also for other OECD countries. It may be noted that these estimates allow for OECD output and interest rate effects, i.e., they measure the response of commodity prices to dollar appreciation over and above any decline which is attributable to the rise in interest rates or output deflation in this period. These findings show that the steep rise in the value of the dollar has had a negative impact upon developing countries, not only by raising the real value of dollar denominated debt, but also by squeezing the terms of trade of primary products. This empirical result showing that dollar commodity prices react to an increase in the dollar value with an elasticity greater than unity, is contrary to the predictions of theory. The relation between exchange rates and commodity prices was set forward by Ridler and Yandle (1972) and developed further by Gilbert (1987), and this theoretical analysis predicts that the elasticity of the dollar price of commodities with respect to the value of the dollar should lie below unity, and probably around $0.6-0.8$. An explanation of why commodity prices over-reacted to the appreciation of the dollar seems important in explaining the low level of real commodity prices in the 1980s.

The hypothesis offered by Dornbusch (1985) to explain this link between dollar appreciation and commodity values lies in terms of the supply side. Dornbusch argues that many developing countries may have responded to the dollar appreciation by depreciating their currency in real terms, i.e., by devaluing *vis-a-vis* the dollar more than other industrial countries. Consequently, the dollar appreciation may have induced large real exchange rate devaluations in developing countries, resulting in an expansion of export supplies, causing downward pressure on commodity prices. Many developing countries were forced to resort to real devaluations due to the increased real burden of dollar denominated debt, as well as the balance of payments difficulties induced by the world recession. The hypothesis is that with the rise of the dollar and the rise in world interest rates, many developing countries faced a sharp rise in debt repayments, and were forced to expand export supplies in order to boost export earnings. This rise in export supplies was responsible for the fall in commodity prices.

This question has been taken up more

systematically by Gilbert (1987) and Chang (1987). Gilbert (1987) estimates an equation for the dollar commodity price, using quarterly data from 1965 to 1986. This equation is estimated for the World Bank 33 commodity index (excluding energy), as well as the three main sub-indices—food, agricultural non-food and metals and mineral.⁴ Our focus is on the relation between exchange rates and commodity prices, and one important modification that Gilbert introduces is to use a more appropriate index of the dollar exchange rate than the IMF MERM index. The MERM index is based on a weighted average of exchange rates, with weights based upon the importance of countries to US trade, which is clearly unsuitable when one is concerned with the effects on commodity prices. Instead, an index of dollar value based upon OECD gross domestic weights is used, which is clearly more appropriate. The explanatory variables include those normally used such as OECD output growth, interest rates and the value of the dollar. In addition to test the hypothesis that debt service requirements have contributed to low commodity prices, the logarithm of the debt service commodity price index ratio is also used. This reflects the idea that with a higher debt service burden relative to export earnings, countries increase commodity exports with a consequent negative effect upon commodity prices.

The empirical results provide some support for the hypothesis that debt induced supply shifts have been important in the decline in commodity prices. The first finding is the distinction between the compensated and uncompensated elasticities of the commodity price with respect to the dollar exchange rate. The compensated elasticity allows for the real debt effect and therefore is an estimate of the effect of a change in dollar value keeping the debt service ratio constant, whereas the uncompensated elasticity considers the total effect. Gilbert finds that the compensated elasticity lies in the range [0.6, 0.8] for the aggregate index in line with the Ridler and Yandle theoretical results. The evidence for debt effects is particularly strong in foods, resulting in an uncompensated elasticity of [0.9, 1.1] while the compensated elasticity is 0.76. The evidence for debt related effects is somewhat less clear-cut for agricultural non foods and weak for metals and minerals where the difference between compensated and uncompensated elasticities is not very large. On the basis of these results there seems to be some evidence that debt-induced supply shifts are partially responsible for depressed commodity prices, particularly since they seem to be the only coherent explanation for the large negative effects of dollar appreciation upon commodity prices.⁵

While Gilbert's conclusions have been questioned by Chang (1987), it seems to us that his arguments are not very persuasive. The alternative equations estimated by Chang, which purport to show the irrele-

vance of debt related effects, seem improperly specified and fit worse than Gilbert's.⁶

To summarise, there seems to be some evidence in favour of the hypothesis that the increased burden of debt faced by many primary producing countries has been partially responsible for weak commodity prices in the 1980s. While the evidence is not conclusive, there does not seem to be any other convincing explanation for the behaviour of commodity prices. In addition, such an explanation can also enable us to make sense of the extremely large effects of the dollar appreciation. Of course, such a hypothesis cannot be adequately tested at the aggregate level. What is needed is a more detailed investigation of individual commodity markets in order to see whether the balance of payments requirements of primary producers have resulted in efforts to boost export supplies by exchange rate devaluations and other means. The effects of these measures upon actual supplies and commodity prices also merit further investigation. A study of inter country differentials in export performance can also shed light on this question.

III

Devaluation, Producer Incentives and Export Supply: An Analysis of the International Tea Market

In this section we take up a single commodity market in order to consider in more detail the questions raised in the previous section. In particular, we consider the question of devaluation and producer price incentives in order to see whether such policies may have led to over supply and downward pressure upon prices. The choice of tea was dictated by several considerations. We have already seen that the over supply and debt related effects were most clearly indicated in the index of foods, suggesting that further analysis be focused on a commodity belonging to this category. Tea is one of UNCTAD's list of 16 core commodities with 85 per cent of world exports being made by developing countries.⁷ Exports are highly concentrated upon four countries (India, Sri Lanka, China and Kenya) accounting for two thirds of world exports. The high concentration of exports makes the interdependence between commodity producers particularly relevant from a policy perspective, since the fewness of numbers makes an explicit allowance for such interdependence easier. In addition, three of the above four countries belong to the Commonwealth and are also the main producers of black tea.

Long term trends in the tea market have been adverse for producers. The product exhibits a very low income elasticity of demand at high levels of income, so that demand from developed countries has been stagnant. In addition, consumer tastes have been switching away towards coffee and synthetic substitutes in the main export markets such as the United Kingdom. As a result

industrial market economies imports fell by 0.6 per cent per annum in the years 1971-1984. Both because of population growth and a possible higher income elasticity at lower levels of income, developing country imports of tea grew at 4.7 per cent per annum over the same period, enabling the exporters to increase supplies at 2.4 per cent per annum. Excess supply has also been mitigated by the growth of demand in some of the main producing countries, such as India, where the domestic market has become increasingly important. Traditionally, India and Sri Lanka, and to a lesser extent Indonesia held a monopoly of the black tea market, supplying almost 90 per cent of world exports at the end of the war. Their market share has been eroded by the rise of the newer producers in Africa, in particular Kenya, and to a lesser extent, Malawi, Tanzania and Mozambique. The importance of tea to the balance of payments of these countries is also obvious from Table 2. Sri Lanka, Kenya and Malawi are strongly dependent upon tea export earnings, with almost a third of revenue being earned by the single crop in the case of Sri Lanka.

Chart 6 shows the developments in the international tea price in real terms since 1959. Once again we deflate the tea price in dollars by an index of industrial country export values in dollars to get a measure of the real price. The picture is clearly one of long term decline in the terms of trade of tea *vis-a-vis* industrial commodities. The index of the real

price of tea in 1987 was less than a third of its level in 1959. One aspect needs comment: the sharp rise in prices in 1984. This was due to the imposition of export curbs by the Indian government in order to moderate domestic tea prices. It is striking that this episode was so ephemeral, with the price of tea falling below its 1982 level by 1986, and continuing to decline in 1987.

The methodology of our study needs to be explained first. The question we ask is to what extent have devaluation and export promotion policies been responsible for an increase in export supply in the main exporting countries, thereby putting downward pressure upon tea prices? In the first instance, we examine the policy environment in the main black tea producing countries,⁸ and detail the nature in which incentives in the export sector have been altered by government policy. Subsequently, we examine the effect of these changes in incentives upon export supplies. We estimate export supply functions for the main black tea producers, in order to see the nature of the relevant supply elasticities. Finally these results, together with information regarding demand developments are assessed in order to arrive at some tentative conclusions as to the validity of the hypothesis under question.

EXCHANGE RATES AND EXPORT INCENTIVES IN SELECTED COUNTRIES

Economic theory tells us that the supply of tea from the producers in any country depends upon the real price of tea received by producers. This real price is simply the tea price paid in domestic currency to producers, deflated by an index of input price, as well as prices in other sectors of the economy. For simplicity we can take the consumer price index as the relevant deflator.⁹ In the absence of any taxes or subsidies to producers, the real producer price is simply the product of the real international tea price and the real exchange rate. Consequently, the percentage variation in the real producer price can be decomposed into the percentage change in the real international price of tea and the percentage change in the real exchange rate. Variations in the real price of tea have already been considered in the introduction to this section. There has been some controversy about the appropriate measure of the real exchange rate (see for instance Wickham, 1987). For our purpose, since we are concerned with the profitability of exporting a primary commodity, the simplest measure seems the most appropriate as well. The real exchange rate is defined as the product of the annual average exchange rate in dollars (the price of one dollar in terms of domestic currency) and the price index of industrial country exports in dollars deflated by the domestic consumer price index. Variations in this real exchange rate index depend upon nominal exchange rate changes as well as relative rates of inflation.

Chart 7 shows Kenya's real exchange rate over this period. It is clear that Kenya has had a trend towards a real exchange rate devaluation since the late 1970s. Exchange rate policy has favoured the tradable sectors, and in the case of tea, has partially alleviated the costs to producers of the decline in the terms of trade.

Chart 8 shows Sri Lanka's real exchange rate. In Sri Lanka's case, there was a tendency towards a real exchange rate appreciation in the early 1980s, but this has been reversed recently.

Chart 9 shows that India's real exchange rate, which also had a tendency towards appreciation until 1982, has depreciated subsequently.

Apart from real exchange rate variations and changes in the real tea price on international markets, the extent of producer subsidies/export taxes can also clearly vary. Data on this are difficult to get, and it is not clear how one can allow for this. In the case of Kenya however we have been able to get the actual producer price, which when deflated is clearly the relevant variable.

Finally, the extent of import protection is clearly important. Several countries have embarked upon policies of import liberalisation in the recent period. Such policies reduce incentives for import substitution, and increase the effective rates of return in export industries. Kenya has embarked upon such a policy in the 1980s, while Sri Lanka has undertaken a substantial degree of import liberalisation since 1977. India has also done some import liberalisation, however, this has not been on the same scale as the other two countries.

Charts 10-12 show the behaviour of tea export volumes in the three countries. Export volume shows strong growth in the Kenyan case, but is stagnant with some tendency to decline, in both Sri Lanka and India.

The econometric estimation of export supply functions poses major problems. In the first instance, gestation lag between planting and production is long in the tea industry, typically being about six years. This implies that productive capacity in any year depends upon decisions taken six years ago, on the basis of expectations about future prices prevailing at that time. This in turn must involve expectations as regards the development of international prices, and about exchange rate policy, domestic inflation, as well as a whole host of other incentives such as producer taxes/subsidies. Ideally, one should model these expectations perhaps by a recursive autoregression. In practice it proves almost impossible to estimate such an equation due to the limited number of observations, and major structural changes.¹⁰ The entire period since the 1950s has been one of a structural shift in the international tea market. Kenya, the new producer, has rapidly increased its market share, while India and Sri Lanka, the established producers, have remained stagnant

in terms of export quantities. Econometric estimation would have to take into account these complex factors, and these problems are more fully discussed in Bhaskar (1988). In this paper we merely report our findings.

Kenya

The econometric estimation was most successful in the case of Kenya. For all estimations conducted in periods after 1968, the real producer price of tea was an important determinant of export supplies, and the price elasticity of supply was approximately 0.5. In other words, a 1 per cent increase in the producer price induced a 1.5 per cent increase in export volume of tea. However, the years before 1968 seem to indicate the lack of a clear price response. One explanation may be that the years 1960-68 include the final years of colonial rule and the first years of independent Kenya. The political uncertainties during this period, particularly among expatriates, could well be responsible for this phenomenon.

As we discussed earlier, incentives for export production may not be completely captured by the real producer price of tea alone. Another important factor may be the incentives for import substitution, import liberalisation may increase the incentives for export sales by shifting resources away from import substitution industries. To allow for this possibility we constructed an index of the rate of import duty, this turned out to have a negative effect on export supply, although the coefficient was not significant at the 5 per cent level (the *t*-statistic was 1.6).

Sri Lanka

The Sri Lankan tea industry has performed relatively poorly since the war. The index of export volume has remained stagnant, it was 102 in 1960, 100 in 1980, and 113 in 1986. Exports in the 1980s have remained well below their peak of 123 in 1965. Sri Lanka has lost market share as well, from 26 per cent of world exports in 1949-51 to 18.2 per cent in 1981-83. However, tea continues to play an important part in the Sri Lankan economy and exports, providing 31.3 per cent of export revenue in 1981-83.

The results on export supply responsiveness were less clear-cut than in the case of Kenya. The estimated equations gave more or less similar results regardless of the sample period. In all cases the coefficient on prices had the expected sign, but was not significantly greater than zero at the 5 per cent level of significance. The point estimate of the elasticity of supply was also lower at approximately 0.1. This is clearly a fairly low elasticity. The performance of the equation was much poorer than in the case of Kenya and the presence of a negative time trend brings out the relative stagnation of the Sri Lankan tea industry, with a tendency of output to decline. The responsiveness of supply to prices also seems fairly low. The lack of price responsiveness may also be a reflection of the structural changes brought about in

the industry in the early 1970s. The government carried out a land reform and many estates were nationalised, and began operating as public enterprises. These publicly owned companies were less concerned with profit maximisation than with other goals such as employment maintenance and ensuring foreign exchange earnings. Such a motivation would make downward adjustment of supply less likely should the price of tea fall in the international market - since tea provides almost a third of Sri Lankan foreign exchange earnings this would have serious effect on the balance of payments. In such a situation the government would be more interested in boosting exports to earn foreign exchange even if prices were unprofitable. Such factors could make for low supply elasticities in the industry.

India

India has long been the major player in the international tea market. While its share of the international tea market has declined from 49 per cent in 1949-51 to 26.6 per cent in 1981-83, it still remains the largest producer and exporter. A major difference as compared to the other countries in our study is that India is also an important consumer of tea. The domestic market has grown rapidly and domestic absorption has been an important reason limiting the over supply in the tea market. The importance of domestic consumer interests was brought home sharply by the events of 1984 when the Indian government curtailed tea exports in order to moderate domestic prices thereby sending international prices skyrocketing, albeit for a very brief period. Further the Indian exports are considerably more diversified than either Kenya or Sri Lanka with tea contributing only 6.6 per cent of export earnings in 1981-83.

Estimation of an export supply function proved most troublesome in the Indian case. Despite trying a number of specifications, we were unable to find a satisfactory equation. In most estimations the coefficient on the producer price turned out to be negative. Nor is this explainable on theoretical grounds. The plantation sector consists mainly of profit maximising firms, and peasant production or the state sector are not relevant.

We are now in a position to summarise the results of our study of the international tea market. The elasticity of supply does not seem to be very high in the international tea market. This seems to be the case particularly for the two largest producers, India and Sri Lanka. In the case of Kenya there is more evidence of supply responsiveness. Consequently, there does not seem to be very strong evidence in favour of the hypothesis that exchange rate policies have encouraged oversupply in the international tea market. Perhaps one might be able to argue that in the absence of exchange rate devaluations, the collapse of tea prices in the 1980s might have brought about supply adjustments in

the main producing countries, with some reduction in capacity. An evaluation of this hypothesis would however have to consider alternative policy scenarios in individual countries, something which is beyond the scope of this study.

Our study also suggests that demand factors may have played an important role in the tea market, in a way which is not often noted. It is clear that the main increase in the demand for tea in recent years has been from the developing countries. Whereas demand in the industrial countries has declined, consumption in the developing world has grown at 4.7 per cent per annum. This is also consistent with the low income elasticity of demand for tea at high levels of income, with demand being more responsive to income when income is low. One of the factors behind the slow growth of demand in the 1980s is therefore likely to be the stagnation in living standards, with absolute decline in some instances in the developing world. Due to the debt crisis and the fall in price of other commodities, incomes have been squeezed thus squeezing demand.

IV

Trends in Real Exchange Rates among Major Commodity Producers

Rather than follow up our study of the tea industry with another commodity study, we pursue a different tack in this section. We consider the behaviour of real exchange rates in countries which are important commodity producers. We take up those countries which produce an important share of the total value of commodities traded on the international market, and consider whether exchange rate policies have been such as to give rise to a tendency towards over supply in these countries. More specifically, we base our choice of countries upon their shares in the total trade of the World Bank's 33 commodities. We exclude those countries which are mainly oil producers. The sample of countries chosen consists of Argentina, Brazil, Colombia, Malaysia, Indonesia and Thailand. Two other countries, Chile and (to a lesser extent) Philippines, are also important commodity producers. However, a study of the evolution of their real exchange rates has already been conducted by Wickham (1987), and we can draw upon his results to extend our discussion. Table 3 shows the share of these countries in total commodity trade: those countries which are significant oil exporters are marked with an asterisk.

To give an idea of the importance of these countries, we can consider their market shares of individual commodity exports. Argentina has 8.7 per cent of the maize market, 5.9 per cent of the groundnut market, over 5 per cent of the markets for wool, beef and wheat, and 61 per cent of the market for linseed oil. Brazil has 20 per cent of the coffee market, 12 per cent of the cocoa market, 25 per cent of the market for

iron ore, 13.5 per cent of bauxite, 13 per cent of manganese, 32 per cent of sisal, 10 per cent of tobacco, and 6 per cent of sugar. Indonesia has 25 per cent of the rubber market and 13 per cent of tin. Malaysia has 70 per cent of palm oil, 47 per cent of rubber and 29 per cent of tin. Thailand has 22 per cent of rice, 15 per cent of rubber and 13 per cent of tin. Philippines has 27 per cent of copra, Chile has 22 per cent of copper and 25 per cent of fishmeal, and Colombia has 16 per cent of the coffee market.¹¹

Since these countries are the most important players in international commodity markets, supply conditions in aggregate are likely to be dominated by their internal economic developments. Charts 13-18 show our calculations for real exchange rates in these countries between 1978 and 1987. The three Latin American countries have undergone substantial real exchange rate devaluations in this period. The trend has not been uniform, as one might expect given the high inflation rates which have characterised these economies, but the overall movement of the real exchange has been upward. The magnitude of real devaluations has been particularly great in Argentina and Colombia. Turning to South East Asia, Indonesia has undertaken a major devaluation. The experience of both Malaysia and Thailand has been rather different. Both these countries experienced real appreciations in the early eighties but this has been reversed by depreciations since. Their exchange rates do not show any significant trend over the entire period as a whole. In addition, Wickham's analysis (1987) shows that Chile and Philippines have appreciated in real terms in the recent period.

In terms of the importance of countries in the commodity markets, it therefore seems that exchange rate depreciations have been significant. In our sample, three important countries (Argentina, Brazil and Indonesia) have had big devaluations, and so has Colombia. It is difficult to argue conclusively, on the basis of this evidence, that such policies have been primarily responsible for over supply in commodity markets. However, it is clear that such exchange rate changes aggravate the disequilibrium in commodity markets, by preventing supply

TABLE 3. SHARES OF SELECTED COUNTRIES IN TOTAL COMMODITY EXPORTS OF THE WORLD (Per cent)

| Country | Average Share (1981-83) |
|-------------|-------------------------|
| Argentina | 0.8 |
| Brazil | 1.5 |
| Chile | 0.6 |
| Colombia | 0.5 |
| Indonesia* | 3.4 |
| Malaysia* | 2.2 |
| Philippines | 0.5 |
| Thailand | 0.7 |

reductions. The recent weakness of commodity prices can perhaps be explained in such terms. With many countries facing a continuing debt burden and balance of payments difficulties, and adopting policies to at least retain if not increase export shares, adjustments in supply will be further delayed.

In addition, there is another factor making for excess supply. Metals and minerals are often produced by para-statal organisations, whose objectives are closely linked to those of national governments. Even in the absence of exchange rate depreciations, such firms can pursue goals such as maximising export revenue without a concern only about profits. Anecdotal evidence exists for such behaviour, for example, in the case of Chilean copper exports.¹²

V

Interdependence, International Institutions and Economic Policy

Commodity markets can, in some respects be characterised as a situation of "competition among the few". Although the individual producers of a commodity like tea may be atomistic, with no market power, the

countries concerned often have a large share of the market. Since the incentives affecting the individual producer are determined at the level of the government, economic policy clearly must take into account the 'largeness' of the country concerned. This in itself is well established and uncontroversial. Traditional trade theory argues for the need for an optimum export tax in the case where the country is a major supplier on the world market, and where the export product is produced competitively (see, for example, Corden, 1974 for a discussion). However, not much attention has been focused upon the problem of interdependence, when producers are few, and where each's policy exerts a powerful influence upon the other's export earnings.¹³ In this section we propose to take into account some implications of this interdependence, and to consider their implications for exchange rate and export policy.

Consider now an individual country deciding to provide the optimum level of export incentives from its point of view. The higher the level of export incentives for the primary product, the larger its supply, and hence lower the international price. From the individual country's point of view, the op-

timum outcome is such that it balances the cost to itself of a lower price against the benefit of additional sales. It need not take into account the effect of this lower price upon other producers. In other words, if each country chooses the export incentives according to its own interest, the resulting outcome is strictly inferior for all exporting countries concerned. If countries could co-operate, and provide lower incentives to their primary producers, they could all do better.

While this argument is perfectly true, it may well be objected that the countries concerned will not co-operate, since such co-operation is fundamentally unstable. Each country will be moved by its own self-interest to break any co-operative agreement by expanding incentives for its own exporters. This argument however fails to take account of the fact that countries have typically not provided high levels of incentives for their primary producers. International institutions such as the IMF or the World Bank have shown us that many countries often follow policies which are not designed to encourage export production, and have argued that a reversal of such policies is necessary for an improvement in their economic performance. This suggests that political pressure

groups exist, which would make for a lower degree of export orientation. The role of international organisations has often been to exert pressure for an export orientation in economic policy.

The arguments presented here suggest that an international organisation which is concerned about the export performance and balance of payments of a group of countries should take the interdependence between them into account. Even if it be the case that it would be optimal (in welfare terms) for each country to maximise its export earnings, the optimal policy suggested by the organisation should be different. More specifically, the countries concerned can maximise export revenue by each individual country not maximising its own revenue. On the other hand, should each country try to maximise its own export earnings, the net effect would be lower export revenue.

This also suggests that an evaluation of the policy recommendations of international organisations should take into account the effects of these policies upon all the countries which are affected by the policy, rather than merely the specific country to which the policy is addressed. That such a perspective is important is in fact suggested by Camdessus, Managing Director of the Fund, who declared that the objective was "to focus the attention of each country on the consequences of its actions for the others and for the rest of the world, and to help to evaluate the consistency of national policies with objectives for the group as a whole". This also implies that the standards of assessment of Fund stabilisation policies must be different. It is also usual, in discussing policy alternatives, to compare countries who have adopted different policies, and to see which one has done best. This procedure is not very useful, since the country which adopts a policy of export promotion may do better than one which does not. However, both countries may have done better had neither undertaken such policies.

In conclusion, one may suggest that policies in developing countries should be such as they do not aggravate the fundamental over-supply in commodity markets, and enable a downward adjustment of supply potential. These adjustments are difficult in a situation of chronic debt and balance of payments difficulties, when countries are attempting willy-nilly to expand their exports. One alternative would be for such countries to expand manufactured exports without stimulating commodity supplies. For instance, a policy which could achieve such a goal could be a devaluation coupled with a tax upon primary exports. This would permit import substitution and export promotion in manufactures without increasing commodity supplies. Politically however, such taxes may be difficult to impose in conditions where real commodity prices have seen such sharp declines, and where primary producers have seen sharp cuts in living standards. Another alternative could be the promotion of manufactured export and import

substitutes specifically, via tariffs and export subsidies. Although such a policy is equivalent in economic terms to one of taxing primary exports while resorting to a devaluation, it may be politically less difficult to impose. Diversification into manufactured exports may have its own problems (including the possibility that the fallacy of composition operates here as well), but these are likely to be less severe than the outlook in commodity markets unless fundamental supply adjustments take place in the near future.

Notes

[I am grateful to David Bevan, Paul Collier, Bunt Ghosh, Christopher Gilbert and Ganeshan Wignaraja for discussions. My special debt is to Hans Singer for his numerous suggestions and detailed comments on earlier versions of this paper, and to S K Rao for his comments and encouragement. Needless to add, I alone am responsible for the views expressed here and any errors.]

- 1 See Ghosh et al (1987) for an evaluation of commodity price stabilisation.
- 2 See Dornbusch (1985) for a demonstration of the close relation between developed country growth and real commodity prices.
- 3 Singer (1988) argues that since actual prices have clearly fallen short of forecasts, this should constitute grounds for debt relief to borrowers whose debts were incurred on the basis of such forecasts.
- 4 The estimated models are developed from the general to parsimonious strategy suggested by Sargan and Hendry, and have an error-correction representation.
- 5 Of course it is possible that there might be some other explanation for the apparent large effect of the dollar appreciation upon commodity prices. The early 1980s were a turbulent time for the world economy, and other factors may have played a role in the collapse of commodity prices.
- 6 Chang makes a number of criticisms of Gilbert's methodology: firstly, he questions Gilbert's error correction specification and criticises the regression of the change in commodity prices upon (among other things) the level of debt service, and argues that higher level of debt service will result in lower commodity prices rather than falling commodity prices. This criticism is clearly misplaced, since, in the error correction specification, the change in the dependent variable is related to the deviation from the equilibrium relationship between the levels of the dependent and explanatory variables. The equilibrium relationship is clearly specified in levels, so that the change in commodity price will be zero once equilibrium is established between the level of commodity prices and the debt service ratio. Chang conducts an alternative estimation which purports to show that the debt service ratio has no significant effect upon commodity prices. He estimates an equation in levels, which does not include the lagged dependent variable among the regressors. This seems dangerous given the importance of lagged adjustment in export supplies, and not surprisingly he finds evidence of positive serial correlation of the residuals, indicating dynamic misspecification. A second estimation is performed where the first difference of the commodity

price index is regressed upon a distributed lag of first differences of other explanatory variables and upon the level of the debt service ratio. This procedure is misplaced since by differencing one loses valuable information about the long-run solution (see Granger, 1986), and in addition it makes no sense to estimate a relationship between variables of different orders of integration (such as the debt service ratio and the change in commodity prices). In any case, Chang's equations have a higher standard error than those estimated by Gilbert, and often have an elasticity with respect to the dollar exchange rate greater than unity.

- 7 The figure is for 1980 and is taken from the United Nations Yearbook of International Trade Statistics.
- 8 Kenya, India and Sri Lanka are examined in detail. The main country which is excluded is China, and this is because the effects of exchange rate policy will be quite different in a planned economy.
- 9 Note that this may not be strictly correct if there is a divergence between trends in consumer prices and input prices. Maizels (1986) makes this point particularly in the context of wages, if wages rise less than output prices, as is often the case in devaluations, the incentives to export may be greater than suggested by our index of the real exchange rate.
- 10 For other attempts to model export supply see Goldstein and Khan (1978) or Hussain and Thirlwall (1984). Bond (1983) and Adams and Behrman (1982) obtain some recent estimates of supply elasticities in commodity markets.
- 11 All figures are based on an average of 1981-83. Two important commodity exporters in the developing world which are not included here are China and Cuba, since the implications of exchange rate changes are likely to be quite different in economies where market allocation is limited.
- 12 See Gilbert and Perlman (1987) for more evidence on such supply behaviour.
- 13 A few writers have discussed the "fallacy of composition" in the policy of export promotion in primary commodities; see Maizels (1986) or Overseas Development Institute (1988) for instance. This problem has also been discussed in the context of manufacturing exports by developing countries.

SUNDARAM FINANCE LIMITED

MADRAS 600 002

FORM IVA

(See Rule 4A(1))

NOTICE

It is hereby notified for the information of the public that SUNDARAM FINANCE LIMITED proposes to make an application to Central Government in the Department of Company Affairs, New Delhi, under sub-section (4) of Section 23 of the Monopolies and Restrictive Trade Practices Act, 1969, for approval to the take over of the whole or part of SUNDARAM FINANCE SERVICES LIMITED

Brief particulars of the proposal are as under

- | | |
|---|---|
| (i) Name and address of the applicant | SUNDARAM FINANCE LIMITED (SF) 21 Parullos Road Madras 600 002 |
| (ii) Name and address of the under taking the whole or part of which is proposed to be taken over and the manner of take over, i.e. by acquisition of shares, acquisition of control or management, whether by the acquisition of ownership of the undertaking or under any mortgage lease or licence or under any agreement or other arrangement | SUNDARAM FINANCE SERVICES LIMITED (SFSL) 21 Parullos Road Madras 600 002 Acquisition by SF to the extent of 51% of SFSL's proposed equity of Rs 2 cr |
| (iii) Management structure of the applicant | A public limited company managed by the Managing/Joint Managing Directors under the supervision and control of the Board of Directors |
| (iv) Capital structure of (a) The applicant | SUNDARAM FINANCE LIMITED <u>Authorised Capital</u> 250 lakhs Equity Shares of Rs 10/ each—Rs 25 cr <u>Issued Subscribed & Paid up Capital</u> 1 20 00 000 Equity Shares of Rs 10/ each—Rs 12 cr |
| (b) The undertaking proposed to be taken over | SUNDARAM FINANCE SERVICES LIMITED <u>Authorised Capital</u> 1 00 00 000 Equity Shares of Rs 10/ each—Rs 10 cr <u>Paid up Capital</u> 70 Equity Shares of Rs 10/ each— Rs 700/ being shares taken up by signatories to the Memorandum of Association |
| (v) Line(s) of business of the under taking which will or is likely to emerge as a result of the proposed take over | Financial services—viz corporate finance investment/merchant banking portfolio management/investment counselling stock and share broking, hire purchase leasing factoring, venture capital operation of mutual funds etc |
| (vi) Consideration for the take over | Acquisition—10 20,000 equity shares of Rs 10/ each (including 70 equity shares held by the subscribers to the Memorandum) amounting to Rs 1 02 00,000/ |
| (vii) Scheme of finance indicating the source(s) of finance for the proposed take over | Entirely from own funds |

2 Any person interested in the matter may make a representation to Secretary, Department of Company Affairs, Government of India, Shastri Bhavan, Dr Rajendra Prasad Road New Delhi within 14 days from the date of publication of this Notice intimating his views on the proposal and indicating the nature of his interest therein

Will Bombay Have a Plan?

Irrelevance of Planners and Their Plans

J B D'Souza

Is Bombay's second Development Plan needed? Is it relevant to Bombay's needs? Would the city be better off with no Development Plan, but only a set of building rules? Does it make sense to adopt a plan for a period of which half has already elapsed?

I

Introduction

LIKE any other large city, Bombay has a myriad problems. From time to time prominent industrialists, officials and politicians pour out laments about the state of the city, each offering his own doleful diagnosis of terminal illness. About four years ago one of them, a former head of a large corporation and later a member of the Planning Commission, gave Bombay only five years more. So now we should be only a year away from mortal decomposition or anarchy.

Contrast this view of Bombay's gallop towards nemesis with the leisurely treatment Bombay's second Development Plan (for 1981-2001) is receiving from the Maharashtra government, which has had the plan under study for the last six years. Indeed, there is little reason to expect that it will receive the government's approval and come into operation by 2001—well before which, we are assured, Bombay will die. Incidentally, the Bombay Municipal Corporation (BMC) began preparation of this plan in January 1977. It sent it to the government for sanction in April 1985. Eight years in gestation and six already in labour—with such a timetable it surely would be prudent to start preparing the 2001-2021 Plan at once. Incidentally, the gestation period in the BMC included publication of the draft for suggestions and close consultation with the Metropolitan Region Development Authority, a creature of the state government.

II

Planning Process

Greater Bombay, capital of Maharashtra, comprises the old (island) city and the suburbs, covering areas of 69 and 369 sq km, respectively. The 1981 census gave the population figures as 3.28 million and 4.96 million respectively, totalling 8.24 million for Greater Bombay. Provisional figures for 1991 add up to 9.9 million. The whole of Greater Bombay is administered by the BMC.

Bombay's Development Plans are drawn up under the Maharashtra Regional and Town Planning Act, which requires plans to be revised at least every ten years. All the authorities concerned find it convenient to overlook this injunction. The first Development Plan, for the period 1964-81, got official sanction in 1964 and still remains in force. The act prescribes that a Development Plan should regulate the use and manner of development of land in the city. It must,

inter alia,

(a) allocate each plot of land for residential, commercial, industrial, agricultural, recreational or other use;

(b) designate areas for public purposes, like markets, schools, hospitals, playgrounds, public utilities and community facilities;

(c) lay down building and development rules, floor area ratios, building heights.

A vital, and probably crippling, omission in the law is its failure to require a thorough assessment of the resources available for execution of the plan. There is only one provision, an inadequate one, that prevents the government from approving a land reservation for a public amenity unless it is sure that the municipal body will be able to afford the acquisition of the land in ten years. Inadequate because there is no way to determine that a particular plot reserved in the plan is beyond the corporation's resource capacity. That kind of judgment could be made only about the whole set of reservations in the plan or a large sub-set of them.

Once the government approves a plan all development and building in the city must conform to it, unless the government later changes the allocation of specific parcels of land. This the law allows if the new exception does not "change the character of the plan". Over the two and a half decades of the first plan's existence and operation, resort to this exceptional power has been frequent and increasing. With land prices soaring, the pressure on the government from individual landowners affected by the first plan's prescriptions has been intense; on most of the many occasions when the government has yielded to it, that has happened for reasons unrelated to the public interest.

Bombay's first plan allocated land all over the city and prescribed rules as the law required. In most senses it was a dismal failure, because hardly any of the several items of development that it envisaged actually materialised. Moreover, the BMC could not find the money to buy more than a tiny fraction of the land the plan had reserved for public amenities (gardens, markets, playgrounds, etc). In fact, the owners of such lands lost interest in protecting them, so that most of them were overrun by squatters. The plan had estimated the cost of its implementation, but had made no serious assessment of the municipality's ability to meet that cost, trusting to vague hopes of outside help, from the State and Union governments.

In 1977 the BMC, which is the Planning Authority under the Town Planning Act, set

about revising the first plan. It was a Planning Cell, manned by civil engineers and architects, chiefly the former, that did the revision. Neither city planners nor geographers, nor economists nor sociologists. At the time when the cell finished its labours the corporation had ceased to exist as a composite elected body. Its functions were performed by a state-appointed Administrator. Aided by a strictly official Planning Committee, the Administrator reviewed the Planning Cell's proposals for the island city as well as the criticisms and suggestions they had evoked from the public. He then sent the part of the plan relating to the island city to the government for approval.

Before the Administrator could deal with the suburbs, elections had returned a whole set of new councillors, who quickly set up their own Planning Group to review the suburban part of the new plan. The corporation was now dominated by a large Shiv Sena majority, while the State had a Congress Party government. The Planning Group's composition reflected this dominance. The group's scrutiny of the suburban plan focused chiefly on individual designations of plots rather than on the important prescriptions in the plan, the policies proposed, the targets adopted, the rules to regulate building, the resource requirements, the municipal resources, and plenty more that a prudent planner for a large city might consider. Its obsession with the reservations gave rise to strong suspicions about its integrity, suspicions that were strengthened by the quality of the recommendations it made to its parent body, the corporation. Land values are very high in Bombay, and pressure to escape an unwelcome reservation correspondingly heavy. Landowners are often eager to reward those who aid such escapes.

Subsequent events suggested that the corporation's Planning Group for the suburbs might have worked out a spoils-sharing system with their councillor colleagues, for the suburban plan, newly manipulated reservations and all, passed through the corporation's hands at breakneck speed. Several wards out of the twelve in the suburbs are said to have received no more than ten minutes' consideration from the general body. And the population target, the policy recommendations, the resource constraints, got no time at all! For a plan to take the city into the 21st century this was speed, indeed.

This plan for both island and suburbs now needed the State government's sanction before it became law, as it were. But rumours of venality had preceded it, and the govern-

was called upon to approve, as also over those that had fallen by the wayside during the councillors' Planning Group's proceedings. Concern within the ruling party in the State government was probably tinged with more than a little envy over what its own members had missed by being in a minority in the BMC.

Nor did anyone at the government or corporation level bother about the two volume report that accompanied the reservation maps and professed to explain them as well as to spell out urban policy for the city's survival. This report was a verbose document of some 600 foolscap pages. It contained an account of Bombay's history, its climate and rainfall, the velocity and direction of wind, the age, sex composition and marital status of its people, and various other features, most of them peripheral in comparison to the economic condition of the population, on which you can find very little. It did make an attempt at a 2001 population forecast, but could not quite choose between a 12 or 14 million low and a 19 million high. So it decided on 9.87 million as a target figure for 2001! It explained this by pleading that the city would not be able to provide for a population level realistically estimated, so 9.87 million would be a sensible target to work on. At the time the report came to the government, Bombay's population was already 9.5 million, and said to be growing by a quarter million yearly. While they were about it the corporation's planning experts - the engineers who spent all those years writing their recommendations - could just as well have chosen a *population target to fit the current level of amenities*, to make life simpler for themselves. If you do not expect to have enough money to feed your infant son when he reaches adolescence, you merely predict that he will stay stunted, you need not then bother about his growing needs.

III

Massaging the Plan

Concern within the Maharashtra government over the councillors' operations on the new plan prompted the appointment of a committee, which it asked me to head, with the task of advising the government on the plan and its building control rules, the resources it would need for its execution and how they could be raised, and anything else germane to the issues involved.

With me on the Advisory Committee were the Chief Planners of the country's Town and Country Planning Organisation and the Bombay Metropolitan Region Development Authority, and a practising architect planner who had worked on a prestigious new town project in the sixties. The government gave us a year to complete our task.

From the start we regarded our task much less as a fishing expedition to uncover and reverse inexplicable or undesirable land reservation decisions than as an opportunity to upgrade the plan that the BMC had sent

features that might more effectively serve the city and the people of Bombay. Our options in this respect were constricted by the provision in the law that forbids 'substantial' modifications of the draft which the government has received from a planning authority without a fresh invitation of public comment, and individual hearing of the new objections. That would have added a further delay of two or three years which, in our innocence, we imagined the city and the government could not afford. So, unlike most other governmental committees in our country which quickly develop aspirations to longevity we were firmly determined to keep within the time limit the government had set. "While a longer work period", we wrote in our report, 'might have produced a better plan, much less time would have been left for execution. Government and the people of Bombay, we believe, are better served by having an appreciable period to implement a plan that is less than perfect than by waiting interminably for an ideal plan that retains only academic value because there is no time to put it into effect'.

Population Forecast

Rejecting both the BMC's absurd population target and the wild forecasts it, planners mentioned only to ignore, we modestly indulged in some crystal gazing on our own bearing in mind the fact that Bombay's growth rate had begun to fall and relating the numbers we could expect in each ward to the area available there and to the movement that had already begun from the congested island city to the suburbs. The figure we adopted for 2001 was 12.5 million.

Plan Objectives

We searched the corporation's 600 page report in vain for the objectives that had informed the plan. In an earlier report entitled "Policy Plan" the planners had listed as the "main objective [sic] of the Development Plan" no less than twenty four items most of them of too little significance to qualify as objectives for such a plan. The improvement in the working of potteries, for instance, or the relocation of tanneries - two of the chosen twenty four - could hardly be goals useful for giving the plan either a focus or a direction.

Although it was too late to fit a set of objectives on to the plan that had come to the government we still believed it useful to identify objectives to guide our own work to explain the plan to the people it was meant to serve, and in choosing among options in implementation. We thought the basic goal should be to promote and sustain growth with social justice in a resource efficient manner. This goal we suggested should be translated into the following operational objectives:

- (a) to facilitate and promote economic growth of the city taking into account its role in the process of national development
- (b) to improve the quality of life, particularly of the poor and deprived citizens of Bombay

such as traffic congestion, over-crowding and pollution, which might occur in the process of economic growth,

- (d) to achieve these objectives in a resource-efficient way, where resources would particularly include urban land, energy, and municipal finances

The BMC planners' light hearted adoption of an impossible population target had left them indifferent to the needs of the city's economy and the imperatives that survive the efforts of planners to contain them. Having seen the dismal failure of attempts at 'decongestion' (horrid word!) and of reliance on floor area and dwelling-unit-density limits to achieve it, we were much less ready to believe in some optimum size for the city. We recognised the harm that cities suffer - and Bombay had suffered - from blind adoption of optimum size concepts, accompanied by a refusal of public authorities to provide services for population levels higher than those arbitrary size limits when growth proved inexorable, services fell to intolerably low levels.

We therefore rejected as impossible and unwise the aim of limiting or reducing Bombay's population that had been an insistent theme of the environmental lobbies in the city. Bombay in our view was a vibrant, thriving hive of activity, a robust source of strength to the national and the state economy. Its per capita net domestic product was nearly thrice as large as that of the rest of Maharashtra. To us the function of the Development Plan was to promote and sustain Bombay's economic growth, and simultaneously to raise the quality of our citizens' lives. The two were closely bound together: it was because people were poor that they lived in squalor and misery, even if the economic level of Bombay's poor might be higher than that of the rural poor. So it was necessary to promote additional employment in the city instead of trying to inhibit it, as the ecology enthusiasts had insisted. Clearly a reversal of the prevalent government policy of discouraging new industry and the expansion of existing industry was called for, with the obvious reservation that environmentally hazardous industry must be excluded. Similarly, commercial activity, trading and office type employment must also be encouraged. This is what we wrote:

The development and indeed the survival, of Bombay should depend not on a superficial vision of this city as an island in itself, isolated from the rest of the State and the country, but as an integral part of the national economic structure, and indeed an instrument of development for Maharashtra and India. A vital part of this larger picture is of course the employment pattern, and its corollary, the migration pattern. People come to Bombay not because they fancy the lights of the big city or because film stars live here, but because of their hopes of finding employment prospects much brighter here than in the rural areas or the small towns. Nor can the same total level of employment be automatically attained by decentralisation,

the quantity of employment an economy generates is not a zero sum, so that activity barred in one place will necessarily grow elsewhere. What blanket bans of the kind the city-savers want can achieve if they are properly enforced is a locational spread at a lower employment level and at a higher cost to the economy. This is because economic activity, whether in industry or trade, depends for its prosperity on facilities available, on communications, on linkages, etc. These do not automatically sprout in officially chosen growth centres, and an activity barred from the city for which its own economic calculus indicates a preference may not be able to survive in an officially promoted growth centre, and may consequently not take place at all. The loss in such a case may not be only that of the individual entrepreneur but that of the economy as a whole.

Notwithstanding the aura of respectability that the curb on employment has acquired in the last two decades, therefore, the committee suggests that the official employment location policy be carefully reviewed. There may be a case for admitting certain activities, particularly those which pose no environmental risks, and for so locating them that they reverse the present commuting pattern (north-south in the mornings and south-north in the evenings).

Realigning the Plan

Our eleven-month effort aimed chiefly at moulding the plan to

- (a) bring more land for housing into the market;
 - (b) persuade private landowners and builders to build houses for people in the low-income groups;
 - (c) ensure that more civic amenities—playgrounds, schools, markets, etc—actually materialise;
 - (d) fit within the resources available;
 - (e) cope with two serious housing problems.
- I shall summarise in the following paragraphs a description of our effort under each of these headings.

Land market. The last twelve years have witnessed an unprecedented rise in land prices. This has been chiefly due to an artificial strangulation of the land market, which has withheld land from prospective house-builders. The principal culprit in this respect has been the monstrous Urban Land (Ceiling and Regulation) Act, which a government eager to establish its proletarian credentials enacted during the notorious Emergency of 1975-77. The act froze land transactions in the cities, and required expropriation of all areas in excess of certain ceiling holdings. For Bombay the ceiling is 500 sq m. Landowners' resistance to the law and growing corruption prevented the government from realising more than a fraction of the land it expected to get from this legislation, but meanwhile housing activity came to a standstill, and land and housing prices consequently sky-rocketed. The law contains a couple of loopholes, and we proposed their vigorous exploitation so as to bring more land on to the market.

Incentives for low-income housing. Bombay's first Development Plan had failed to recognise the economic condition of the

majority of the city's population. In elitist fervour the plan had prescribed built-up area to plot area ratios (called Floor Space Indices, FSI, in Bombay) and maximum densities which took most of the housing built in the city out of the reach of lower middle class and poor people. In the suburbs the density could not exceed 200 units per hectare (10,000 sq m). So to use up the FSI, which was one, tenements had to measure at least 50 sq m (550 sq ft). Construction cost alone for such a tenement would be nearly Rs 1½ lakh, and after adding land cost and developer's profit most of Bombay's lower middle class could not find the smallest such unit affordable. Even on HUDCO's concessional terms, monthly outgoings on a hire-purchase of such a unit would exceed Rs 1,500. Thus the only relief available to low-income groups was promised by the public housing programme, but the size of this programme was altogether negligible in relation to the shortage. Private developers were in any case not interested in building for these groups of people because there was enough demand from upper class people to absorb all their product at prices artificially inflated because of the ceiling law. To counter this disinclination we suggested a housing density of at least 325 units per hectare in several tracts of the city, mostly virgin areas. We proposed a 20 per cent FSI bonus if the density were to reach 450.

Reservations. With the absurd population target the planners had chosen, the set of land reservations for public amenities (schools, playgrounds, hospitals, markets, dispensaries, etc) were bound to fall short of realistic requirements. Nevertheless, the municipal councillors in their wisdom had reduced even these, for reasons that one can easily suspect. Moreover, for these same reasons, the reductions were not evenly spread over the several districts in the city. We tried to reverse most of these reductions.

Experience with reservations during the earlier plan period had not been happy, and this provided an excuse for the reductions the councillors had made. The municipal body had been unable, or unwilling, to spare money from its growing revenues to pay for the acquisition of the lands reserved for amenities, except to a very small extent. Partly to prevent a recurrence of this experience, we supported the concept of Transfer of Development Rights (TDR) that the municipal planners had proposed. Landowners whose plots were reserved would be encouraged to give over their plots free of cost to the municipality, but would retain the development potential, which they could use elsewhere, or even sell. We expected a very substantial response to this scheme.

Resources. The municipal body as well as the planners who prepared the second plan were obsessed with an impression that the BMC was too poor to afford the plan they had prepared. Against a total cost of Rs 3,419 crore at 1984 prices, to be spent by 2001, the planners thought the corporation could find only a pathetic Rs 20 crore each year for their plan.¹ To us, accustomed as we were to the BMC's mendicant tendencies, this poverty obsession was incredible. So we

had a careful study made of the resources available to the corporation. We found that no less than two-thirds of the plan could be financed from the municipal revenues. The gap did not worry us unduly, because of the FSI concession (TDR) I have just described, which would greatly reduce the cost of acquiring the land needed for public amenities.

Building rules and development control. Apart from rewriting the Development Control Rules to make them more useful to architects and developers generally, we introduced a few features into them to promote the objectives of the plan. I have already referred to minimum density prescriptions and to TDR. We proposed a stretch of the TDR concept to help with two other problems. Bombay's housing stock is crumbling rapidly, thanks to our antiquated rent control legislation. The level at which rents are controlled makes regular maintenance and repair impossible. To induce landlords to rebuild decaying houses without throwing their tenants on the streets, we proposed that a landlord of an old building who rebuilt and rehoused his tenants should get a Development Right to that extent, which he would use in exactly the same way as the owner of reserved land. Large pieces of land in the city are also covered by slums, and we recommended that the owners of slum land should be similarly rewarded with Development Rights, if they built to rehouse their slum people.

IV

The Plan in Bumbledom

In August 1987, well within the period we had been given for our work, we proudly presented our report to the government, urging confidently

that government sanction this plan as soon as possible. Any delay will attract a fresh flood of representations from applicants whose cases have already been dealt with. For government the temptation to look at such representations will be strong, but if it yields to that temptation it will have to set up new machinery to deal with them afresh, an iterative process that may end only in 2001. We are confident that, with all its flaws, the plan we submit today will result in a much more livable Bombay 2001 than Bombay 1987 is, particularly for the poor.

The State's chief minister, to whom we handed our report, directed that it be processed in a month. Today, nearly four years later, the plan is still in labour, with only occasional signs of delivery. The ministry has consulted everyone who happened along, including the BMC and some new committees within the government machinery. It is not clear whether the delay is simply the result of official doodling, or if a deliberate ploy to cover activity of another kind. For in April 1989, it suddenly became public that the government had been quietly releasing plots from reservation. The minister admitted to 285 releases. A major uproar ensued. There was a strong suspicion that the government had been indulging in the very same venality that it had so sanc-

councillors had been accused of it three years earlier. The press mentioned a sum of several hundred crore as the total take. An environmental group took the 'dereservation' case to court. Meanwhile, the plan continues its labour pains, although ten years of its life have ebbed.

At the end of February 1991, however, the government published the new building rules which it named Development Control Regulations. They included a number of the innovations that the municipal planners had introduced or we had added. The impossibly low densities of the first plan were raised more or less as we wanted, with minima and not only maxima being prescribed. The FDR concept also survived, despite attack on it in the interim. In misguided zeal that betrayed more confusion than clarity its assailants had identified it with the infamous floating FSI that a former municipal commissioner had illegally allowed many years earlier. Builders had then surrendered the FSI potential of an unbuildable plot in the remote suburbs and secured in return an equivalent FSI in South Bombay. The new FDR system allows a movement of FSI potential only northward in the suburb.

For the first time the new regulations try to draw private initiative into the clearance of slums. They raise the FSI for slum land owners *two and a half times* if they accommodate their slum people in the houses they put up. Since the slum hovels in most of Bombay are ground level structures they barely use up an FSI of one. Is it really necessary to pitch the incentive to private effort so high at FSI (c. 2.5) and more which is what the landowner will have at his disposal after he houses the slum people? It is one thing to earmark special virgin areas for intensive use and high densities; you can then tailor the municipal services to these features. It is quite another to introduce high densities and high FSIs in slum pockets all over the city where the level of services is already frozen and cannot be augmented.

V

Relevance of Urban Planning as Practised

The story of Bombay's second Development Plan offers some clue to the continuing irrelevancy of India's urban planners and the product they offer. Some of these clues relate to the process that development plans follow before they acquire legal force. The others concern the content of the plans our planners prepare.

Procedural Features

Endemic delays. The account I have given above demonstrates first the leasurcliness of the planning process. The 1981-2001 Plan went into preparation four years before the start of the Plan period. Today ten years into that period it still awaits the government's seal of approval. Some of this lapse of time can be ascribed to the requirements of the law. The detailed survey of present land use

FORM I A

[See Rule 4A (1)]

Form of general notice to be given to the members of the public before giving a notice to the Central Government under sub-section (1) of Section 21 of the Monopolies and Restrictive Trade Practices Act, 1969

NOTICE

It is hereby notified for the information of the public that Kesar Enterprises Limited proposes to give to the Central Government in the Department of Company Affairs, New Delhi, a notice under sub-section (1) of Section 21 of the Monopolies and Restrictive Trade Practices Act, 1969 for substantial expansion of their distillery undertaking.

Brief particulars of the proposal are as under:

| | |
|---|--|
| 1. Name and address of the owner of the undertaking | Kesar Enterprises Limited Oriental House, 7 J Tata Road Churchgate Reclamation Bombay, 400 020 |
| 2. Capital structure of the owner (or situation) | Authorised Rs. 770.00 lakhs Issued Subscribed and Paid up Rs. 359.598 lakhs |
| 3. Name of the unit or division to be expanded | Bahar Tehsil Baheri District Bareilly Uttar Pradesh |
| 4. In view of the expansion relating to production, storage, supply, distribution, marketing or control, to be carried out, indicate (a) Name of goods/article (b) Estimated Capacity before expansion (c) Expansion proposed | (a) Industrial Alcohol (b) 1000 Million Litre per day (c) 4211 Million Litres per day Making 940 Million Litres per day after expansion |
| 5. In view of the expansion relating to (a) increase the extent of export (b) in terms of usual prices (c) as value increase (d) turnover, etc. | Not Applicable |
| 6. Cost of the Project | Rs. 10.45 crores |
| 7. Details of finance indicating the amount to be raised from each source | (Rs. in Crores) Internal Accruals 5.45 Loans from Financial Institutions and/or Lease Finance 5.00 Total Rs. in crores 10.45 |

Any person interested in the matter may make a representation in quadruplicate to the Secretary, Department of Company Affairs, Government of India, Shastri Bhawan, New Delhi, within 14 days from the date of publication of this Notice intimating his views on the proposal and indicating the nature of his interest therein.

For KESAR ENTERPRISES LIMITED

BOMBAY
DATED: 31 May 1991

that the law prescribes takes very long.⁴ So does the planners' painstaking collection of information about the city, much of it of dubious relevance to their task. And then the municipal body at the political level and the State government add their own dilatory processes, to ensure that the final product is obsolescent on the day it gets legal sanction.

Public involvement The second weakness in the planning process as it has generally survived in India is its failure to evoke public participation or even interest. The law requires publication of the city plan before it goes to the government for approval, but seldom is this step more than a formality. For a population so widely uneducated simply announcing in the newspapers that the plan is available for public scrutiny is clearly inadequate. No effort is made to explain its implications to the people it affects at public hearings in each locality. So all that the publication achieves is an arousal of the landowners whose plots are affected by amenity reservations. They are generally the only persons who challenge the respective components of the plan. The vital interest of the general public in the provision of the amenities and therefore in the survival of the reservations finds no expression whatever. In Bombay it took a further depletion of the already inadequate amenity reservations this time without even the formality of publication, to rouse a small public interest group into litigation to save the plan. The localities that would suffer from the deletions remained indifferent to the privations that faced them; they had no means of knowing.

Substantive features

The procedural weaknesses I have listed are serious enough. But in comparison with the substantive weaknesses in our planning they pale into triviality.

Population targets First among the basic defects is the planners' indifference to the economic facts of city life. It is an indifference that takes many forms. Let's look at a few. Despite their experience over many decades, Indian planners cling to their obsession with an optimum size for each city. They shut their eyes firmly to conditions in the rural areas and the comparative attractiveness of the cities to the rural unemployed. So they happily choose impossibly low population targets and scale amenity levels to those targets. When the numbers overtake their targets, as inevitably they will, the city is caught, so to say, with its pants down—a description not altogether metaphorical in our cities with their primitive sanitation arrangements. Meanwhile, of course, the blinkered planners are no longer around to face the consequences of their misguided optimism.

Recent trends in Indian planning have favoured an endeavour to divert migration to large cities by creating growth centres near smaller towns. Some of these have succeeded. Others are dismal failures—in both cases, I suspect, at a higher cost to the economy than a sensible expansion of large city facilities. I have touched on this earlier.

Economic condition of people But besides their 'optimum' obsession, planners also choose to ignore the economic condition of the people they plan for: their income pattern and their desperate search for a livelihood. After the long years that Bombay's planners spent on their research they could tell you all about age pyramids and death rates, sex ratios and the marital status of the people, wind patterns and velocities, humidity and the history of the cotton trade. Very little on the economic condition of the people for whom they were planning. Nothing on employment patterns or on which industries specially suited the city, on the existence or absence of cottage or household industry and the utility of mixed land use. So our city plans seldom cater to the needs of the unorganised sector, which in poor countries offer more employment than the formal sector. Their zoning, their controls, in time and tide, but take little account of reality and therefore tend to be widely violated. Their land use prescriptions in particular favour widely separated ones for residence, as against employment centres, which require needlessly expensive transportation. Cost, were they not so regularly transgressed. This all favours mixed land use, which is also very costly in terms of energy.

Municipal resource Another blind spot in our city planners' efforts is their carelessness about the resources available to pay for the plans they so blithely offer. We have seen how incredibly irresponsible Bombay planners were in this respect. There was hardly a single city plan I saw during my time in the city service that gave an idea of how the money would be found. So planners might as well plan for the moon instead of searching for solutions that fit the actual resource available.

Plan execution Too little thought goes into the problem of plan execution and its commitment to the organisational requirements, so the need to tone up city management. Indian cities have suffered from a distrust at State level of municipal bodies' ability to undertake capital improvements and a consequent readiness to create new development authorities to handle large investment. For State governments such authorities directly under their control have meant opening up patronage, nepotism and downright corruption, because few of these authorities have turned out to be much more than real estate developers. They have offered their creators new opportunities for graft in land disposal. And their output often urbanises the municipal bodies that have to take it over for maintenance, for which these bodies cannot find the resources.

Land banks The urban ceiling law from which Bombay has suffered these last 15 years has actually been the culmination of a series of governmental interventions in the land markets of Indian cities. Many urban administrators and planners have supported a large scale governmental effort to procure land, ostensibly in an attempt to curb speculation in land and what was seen as

excessive escalation in land prices. In the 'fifties Pandit Nehru eagerly promoted this effort in Delhi and about 155 sq km of land were thus frozen for gradual acquisition, development and disposal by the Delhi Development Authority (DDA). Actual development by the DDA went on at a snail's pace, with two consequences, both undesirable. (1) The price of land that escaped the government's dragnet soared to levels undreamt of before. (2) The DDA itself began to realise higher and higher prices for the little land or housing it put on the market. Like the private speculator it revelled in these gains, setting an example that other town authorities all over the country fretted to copy and did copy. With disastrous results so far, as housing was concerned, specially poor people's housing, but often with illicit benefit for the ministers and officials who controlled these land banks. Governments' efforts as colonisers and land developers have seldom benefited the community.

In a practically free economy where speculation in commodities seldom attracts intervention, should speculation in urban land be frowned upon? Is the potential gain to speculators so far out of proportion to the risk involved? And if speculation must be prevented or contained, is it the government that should undertake the task or are other mechanisms available to prevent a construction of supply? A heavy tax on vacant urban land could be one valuable option.

Efficacy in land use The planning of land use in cities poses at least one baffling problem. Poor people generally huddle densely near large employment centres. They need to be there because they cannot afford the cost of long commuting travel. Public housing projects for the poor need to be similarly located. Land near employment centres, on the other hand, tends to be very costly and in allocation of such land to poor people at a subsidised price in a low income housing project or a sites and services project would clearly be inefficient. In any case, such subsidised allottees would soon be bought out and the allottees would move on to adjoining areas to huddle in huddles again. What escape is there from this dilemma?

VI

Concluding Questions

Is Bombay's second Development Plan needed? Is it relevant to Bombay's needs? Would the city be better off with no development plan but only a set of building rules? Does it make sense to adopt a plan for a period of which half has elapsed?

Notes

- 1 A decision by the East Municipal Commissioner shared.
- 2 Unfortunately, the BMC seems to have wasted the data it collected for the second plan's land use survey, as it did with the first plan's too. A valuable basis for continuous planning has been lost.

NOTICE

It is hereby notified for the information of the public that Modern Agencies Limited proposes to make an application to the Central Government in the Department of Company Affairs New Delhi under sub-section (2) of section 22 of the Monopolies and Restrictive Trade Practices Act 1969 for approval to the establishment of a new division. Brief particulars of the proposal are as under: (1) Name and address of the applicant: Modern Agencies Limited Regd Office: Thapar House 25 Brabourne Road Calcutta 700 001 (2) Capital structure of the applicant organisation: Authorised Capital Rs 100 00 000 Issued Capital Rs 48 22 900/- Subscribed & Paid up Capital Rs 48 22 900/- (3) Management structure of the applicant organisation indicating the names of the Directors including Managing Whole time Directors and Managers if any: The Company is managed by the Board of Directors consisting of the following: (i) Shri H C Dass (ii) Shri B N Khanda Lal (iii) Shri S S Lal (iv) Shri M L Khemka (v) Shri D P Arora and (vi) Shri D C Aggarwal (4) Indicate whether the proposal relates to the establishment of a new undertaking or a new unit/division: New Division (5) Location of the new undertaking/unit/division: The proposed new undertaking will be a division of Modern Agencies Ltd and will operate from its Registered Office at Thapar House 25 Brabourne Road Calcutta 700 001 and its other Branch Offices all over the Country (6) Capital structure of the proposed undertaking: Since the proposed undertaking shall be a division of the existing company there would be no change in the capital structure of the Company (7) In case the proposal relates to the production storage supply distribution marketing or control of any goods/articles indicate: (a) Names of goods/articles: Not applicable (b) Proposed licensed capacity: Not applicable and (c) Estimated Annual Turnover—Not applicable (8) In case the proposal relates to the provision of any service state the volume of activity in terms of usual measures such as value income turnover etc: The proposal relates to setting up of a New division to provide financial services and to deal in financial matters viz: leasing consumer finance and hire purchase money market operations portfolio management and activities and services which are incidental and related thereto. Initially estimated turnover of the proposed division would be Rs 36 lacs p.a. which would increase in proportion to the funds deployed (9) Cost of the project: Deployment of funds shall be initially of the order of Rs 150 lacs with a progressive increase in due course (10) Scheme of finance: indicating the amounts to be raised from each source: The sources of finance shall be the internal generation deposits and borrowings as possible according to the applicable regulations. Any person interested in the matter may make a representation in quadruplicate to the Secretary Department of Company Affairs Government of India Shastri Bhawan New Delhi within 14 days from the date of publication of this notice intimating his views on the proposal and indicating the nature of his interest therein.

Sindhi vs Mohajir in Pakistan

Contradiction, Conflict, Compromise

S Akbar Zaidi

The province of Sindh in Pakistan has witnessed acute polarisation between ethnic groups since 1947. In the post-independence period the political complexion of Sindh was radically altered by the arrival of Urdu speaking refugees or mohajirs. The conflict between Sindhis and mohajirs has accentuated in recent years. This paper seeks to identify and explain the reasons for the extreme polarisation between the two communities against the backdrop of the state's role.

THE expression of national and ethnic identity has begun to dominate the political process in Pakistan today in a form unknown to the country in the past. Since independence, the economic and political structure in Pakistan has been dominated by the ruling sections of at first, the mohajirs and the Punjabis, and now more recently by the Punjabis alone, who have come to dominate comprehensively. This domination in the last forty years has given rise to movements of separation and/or national expression, the most successful of which culminated in the birth of Bangladesh. Other movements which did not achieve liberation or greater provincial/national autonomy, include the Baluch movements under Ayub and Bhutto, and the various Sindhi movements beginning from the one in 1948 against the separation of Karachi, to the movements against the martial law regime of General Zia ul Haq. The Pakhtuns have also demanded their rights from time to time in the past, but due to the greater economic development of their region (unlike Baluchistan and Sindh) have recently become more integrated into the federal Pakistani structure. Today, while the Sindhis and the Baluch struggle against Punjabi domination at the centre and within their provinces, the Pakhtuns have partially succeeded in establishing economic and political control over their own region, and thus the 'Pakhtun Question' has taken on a form very different from that of the other nationalities. [Babar Ali 1986, Harrison 1987, Zaidi 1989, Zaidi 1990.]

A major reason for the existing polarisation within Pakistan has been the lack of representative institutions and the persistence of military rule determining economic and political development. As the military is overwhelmingly Punjabi and with its rule comprising more than half of Pakistan's years, regional and ethnic imbalances have worsened [Babar Ali 1987b, Ahmed 1988, Zaidi 1989]. With the centre highly centralised and with no channel for redress for the concerns of those who do not share in the power, the result has been an expression for the rights of those national/ethnic groups which have felt excluded. Democracy, on the other hand, of whatever form, and of even a short duration, has indeed made some difference to the people of this country.

Although governments emerging through the democratic process have not been able to challenge or break the power of the other institutions of the state they have still found some room to manoeuvre. This has been most noticeable in the case of the Sindhis who are the only nationality to have had all three elected prime ministers since 1970 from their midsts. The fact that Zia ul Haq was forced to choose an unknown politician whose only asset was that he came from Sindh following the 1985 'elections', goes to show that Sindh, more than the other provinces, has a special place in the polity of Pakistan.

Sindh also has the distinction of being the province where there has been the greatest polarisation between ethnic groups since 1947. The fact that Sindh was inundated by Urdu speaking refugees (the mohajirs of the 1980s) immediately following independence changed the political complexion of this province permanently. In more recent years, the conflict between the two communities has increased manifold and the resulting violence in the name of national rights has taken on barbaric proportions. It is the purpose of this paper to identify and explain the reasons for the extreme polarisation between the Sindhis and the mohajirs today. I begin with a brief history of the rise of mohajir identity, followed by an outline of Sindhi nationalism. I then proceed to explain the role of the state and of the extent of violence in the context of the Sindhi mohajir conflict. Finally I turn to the present political situation in the province.¹

GROWTH OF MOHAJIR IDENTITY

The Urdu speaking refugees² who came to Pakistan following partition settled mainly in the cities of Sindh—Karachi, Hyderabad, Mirpurkhas and Sukkur.³ The important aspect of the settlement of these refugees compared to those from East Punjab, was that the Urdu speaking refugees settled in areas which were completely alien to the homes they left behind in India. Linguistically, culturally, politically, socially, economically, there was no comparison of these refugees with the 'Sindhi hosts'. Sindh was swamped by an alien culture which immediately began to dominate the rest of Sindh as well as the entire country. Some observers have gone much further and have

said that these refugees came with an 'occupier mentality' and treated the indigenous people with contempt [Tahir 1990]. There is little doubt that the refugees began to dominate Sindh in all respects but this certainly is not based on any sort of conspiracy as most Sindhis are wont to emphasise [Ahmed 1984b, Ahmed 1985a, Tahir 1990]. There are very natural and real material reasons which resulted in this domination.

Sindh's economy was mainly agricultural and feudal with some trading centres and market towns with very little industry [M H Khan 1981, Ahmed 1984c, Arif 1990, Tahir 1990]. Sindhi prominent in political life were mainly representatives from the feudal order since the bourgeoisie and petty bourgeoisie class was still in its embryonic form.⁴ The refugees represented a more advanced urban capitalist culture which they had brought with them from the towns and cities of India. Not only did they have a relatively large entrepreneurial class along with an administrative and educated petty bourgeois service class, they also had a large and well trained working class (certainly a world apart from their Sindhi hosts). Since these refugees felt that they were the real creators of Pakistan and that they had made all the sacrifices in creating this country and also because they were more adept at political manoeuvring and had the skills which were necessary to form and run the state machinery, they took over economic and political power in Pakistan [Sayeed 1980, Alavi 1989, Jalal 1990]. Refugee leadership took over the bureaucracy under the guidance of Jinnah and Liaquat, while their entrepreneurs and their working class set to work to build the industry necessary for survival. The creation of Karachi as the capital of Pakistan and its disarticulation from the administrative boundary of Sindh gave further impetus to refugee power, both real and perceived. Thus refugee identity was quickly concretised within the new state and the refugees emerged as the ruling ethnic group within Pakistan.

For the refugees Sindh was always a backward underdeveloped part of the country having nothing to do with the more sophisticated urban culture which they represented. The superior and haughty attitude of the refugees was (and still is) a persistent affront to the Sindhis. Sindh was still caught in poorly developed capitalist rela-

tions with the absence of any bourgeoisie as a class to challenge the refugees for political, economic or cultural power. Indeed, the refugees did represent a more progressive social order but it was one which had been imposed on an alien land rather than an order which had evolved from within.

Refugee industrialists and traders began to dominate the economy of the country, especially after the Korean war and under the economic programme of the Ayub regime. When the bureaucracy became all powerful in the political mayhem that followed the death of Liaquat Ali Khan in 1951, the refugees were still sitting pretty and were much over represented in government compared to their population which was a mere 4 per cent. They began to share control increasingly with the Punjabis, and the main national group which should have had a major share in the services, the Bengalis were consciously excluded. The Baluch and Sindhis most certainly and the Pakhtuns to some extent, were very poorly represented in the institutions of the state due to the dynamics of the development of productive relations. For the most part, Pakistan inherited the most backward areas of united India where capitalist relations were not dominant of course the Punjab and Bengal were exceptions. Thus, in these areas there was a very small literate class (especially in the languages that mattered) few administrative and service personnel and a weak bourgeoisie. The ethnic composition of the institutions of the state was inevitable—it had to consist of the Punjabis and refugees. Moreover, the colonial legacy from the British also helped perpetuate recruitment patterns which favoured both groups. For the refugees who were protected in their enclave in the federal capital Karachi, the Sindhis were never a competing national ethnic group either for political or economic power. For them, the competition came from the Punjab. Following the death of Liaquat Ali Khan, the refugees were left without a leader of the stature of either Jinnah or Liaquat. This was the beginning of the shift in power between ethnic/national groups in Pakistan which continued with greater intensity once the non mohajir military took over in 1958.

The major blow to mohajir supremacy, however, came in the 1960s when it became clear that the effects of the Green Revolution in the Punjab would alter the economic, demographic and political scenario in Pakistan substantially. As capitalism developed deep inroads into the Punjabi economy reorganising social and economic relations of production, the future leaders of this country began to emerge more forcefully, both as an economic entity and as a political force. Not only was the new dynamic entrepreneur born, but as education took hold of those who were leaving rural Punjab and were now migrating to cities, government jobs also became more competitive and scarce. The mohajirs from India who had an edge in the earlier days

were now threatened. Not only was this threat evident in the government sector—at all levels in the hierarchy—but as the Punjabi peasant had been displaced from his land and was mobile, he travelled to the cities of Sindh which had been exclusively mohajir controlled and successfully competed for jobs. Furthermore, in the Ayub Khan era a large number of (mainly Punjabi) civil servants and military officers were made substantial land grants in Sindh which worsened the situation, especially since these new landlords imported labour from the Punjab [Mirza 1986, Tahir 1990, Wright 1991, also see footnote 2]. This was also the period when Pakhtun labour moved to Karachi in a massive exodus from the north. However, there was less of a contradiction between the Pakhtun labourers and the mohajirs since the former did jobs which the latter did not or could not do—unskilled work, construction, transport, etc. Thus the domination of the mohajirs over the state sector and over private enterprise in Sindh and in the rest of Pakistan came to an end, mohajir supremacy and exclusivity was challenged as capitalism developed and as the Punjab which had the most advanced economy took control of the entire country. Sindh was no longer the domain of the mohajirs, the Punjabis began to dominate industry, land, service and also displaced local labour in both the rural and urban areas of the province.

Mohajir lead is have always emphasised the fact that they have voted for parties which have been outside the mainstream or in opposition. In 1964 their leaders supported Jinnah against Ayub Khan, in 1971 when the country was under Bhutto's socialist wave, the mohajirs voted for the Islamic fundamentalist parties of the Jamaat Islami and the Jamiat ul Ulama Pakistan. In 1977 they again voted for the reactionary Pakistan National Alliance against Bhutto and now in 1988 they voted for their own party, clearly the zenith of their consciousness and development. Although mohajir identity *per se* has only become crystallised after the official launching of the Mohajir Qaumi Movement (MQM) in 1986 and by the violent events following that, there have always been the seeds of an exclusivity of identity in this community.

The mohajirs have always supported the fundamentalist Islamic parties which have identified themselves as Pakistani and until the recent formation of their own organisation, have distanced themselves from all parochial groups. One can understand the reasons for this support: they did give up their homeland and needed the concept of Islam and of Pakistan to deal with their new insecurities. They were less concerned about jobs and opportunities in the earlier years and were more comfortable with the concept of the broader Pakistani nation and the structure of the Pakistani state which they dominated suited them. When competition became more difficult and jobs scarce, they had to find a new identity. The Islamic par-

ties were unable to deal with the newly emerging realities and as Punjabis were taking over Pakistan most aggressively, a distinct mohajir consciousness emerged. The election of the first Sindh prime minister brought a large Sindh segment, which has still not emerged from its rural past, into the cities and into the government services. The attempt in 1972 to make Sindh the official language of the province was a statement by this newly emerging bourgeois and petty bourgeois class to assert its identity which had taken many years to concretise. This rise of Sindh nationalism confronted mohajir aspirations and their world view and is probably the first real clash between the two communities. The 1977 election was another occasion where the two groups had different political perceptions with the mohajirs supporting the fundamentalist right wing parties, and the Sindhis the Peoples Party. The 1983 and 1986 Movement for the Restoration of Democracy (MRD) were other examples where the two communities had very different political aspirations. However, the clearest expression of mohajir identity came about after 1986, and more precisely in 1987 when the MQM swept the local body elections.

The composition of the MQM is mainly lower middle class (petty bourgeois, self employed, service workers), the organisation has a very clear hierarchical order within its ranks and order and discipline play a pivotal role in the MQM, the organisation is populist and uses terror and appeases its people interchangeably, most importantly it has given the mohajir community a 'sense of identity unknown to them in the past giving rise to a chauvinism which also requires the identification of some sort of enemy—all attributes which form the core of any fascist organisation'.

There is no question about the fact that the MQM has raised numerous issues related to the genuine problems of its constituency. Unemployment, most of all and a lack of social services are important concerns to not only the mohajirs of Karachi and of Hyderabad but to all the people of Pakistan. The MQM has neither the interest nor a policy perspective about what happens at a national or international level—'we do not support anything which doesn't contain the word mohajir'⁶—and has a very myopic analysis of the problems of its constituency. It is this perception and the lack of comprehension demonstrated by the leaders of the MQM regarding larger issues, which has led the party into a blind alley where desperation now seems to be evident. Since the MQM has failed to improve the conditions of the mohajirs, there has been some disenchantment amongst its constituency. Following their political failure, the only means available for the survival of the MQM is the need to resort to extreme forms of violence in order to terrorise their mohajir constituency into submission. The MQM's armed wing, the Black Tigers, which constitutes a few hundred young men who have

taken an oath to die for their mohajir cause, has played a prominent role in this. The MQM has lived up to its fascist promise.

At this juncture, it is important to digress a little and to deal with the special significance of the city of Karachi in the context of Pakistan and to see how it is located in the MQM's game plan. Karachi plays the dominating role in the economy of the country and although it houses less than 10 per cent of the population, has a third of the country's industrial and financial assets located in it [Zaidi 1989]. The MQM realises this and is thus in a strong bargaining position. The possibility that Karachi be separated from the rest of Sindh has been an issue which has been raised by MQM leaders, and forms a pivotal argument linked to their claim of being Pakistan's fifth nationality. (Some Punjabi intellectuals have also been advocating separation—see Naqi 1990; Mir 1990.)

Karachi has always been a very distinct social, political and cultural entity quite apart from the rest of the country and especially from Sindh.⁷ It was conquered by the British in 1839 before which it was a small town of no real importance, and not before the capture of Hyderabad in 1843 did Sindh come under complete British control. The British made Karachi a cosmopolitan city and developed it independently of Sindh and the city attracted people from all over the empire. The partition of India continued this trend when refugees invaded this city. In 1948 the dislocation of Karachi was formalised by the Pakistani government when it was made the country's new capital. Karachi continued its independent growth and attracted Pakistanis from all the provinces and was never integrated with the province of Sindh which was still dominated by a poorly developed capitalist economy [Haider 1974, Bailie 1975, Khuhro 1978, Spehr et al 1983, Wright 1991].

However, things have been changing over the last few years. Karachi has now become more integrated with Sindh than it has ever been. As capitalism takes hold aggressively in the rural areas, the entire economy is changing at a very fast pace. The market for produce and for consumer goods is expanding thus bringing desolate parts of Sindh much closer and integrating them under the commands of capitalism. There is greater industrialisation of the rural economy which is changing professions, values and social relations. More people are being displaced by machinery than ever before in Sindh, and all happen to be Sindhis. They now head for cities in search of employment and are increasingly making their presence felt in cities which are dominated by mohajirs. Further more, more educated and professional Sindhis are coming into the market in search of jobs and are moving to the most lucrative city of the province, Karachi. Never before have the Sindhis' economic interests in Karachi been of more concern to them. Moreover, with an elected government in the province, with corruption rampant, Sindhis

have acquired a major financial stake in Karachi where they can get property, licences, permits, all at concessionary rates. Thus for the Sindhis, Karachi has become an important source of funds and provides money which is channelled back into the rural economy where it benefits other Sindhis as well.⁸ Also, Karachi today provides as much as 65 per cent of all of Sindh's taxes while it receives much less in return [Ghaus 1988, Zaidi 1988]. The integration of Sindh with Karachi (rather than that of Karachi with Sindh), has meant that MQM's proposal to separate Sindh and to create a mohajir province is now redundant. This new reality once acknowledged, will certainly disturb the mohajirs for they will be unable to give their 'nationalism' any territorial claim. This fact may prove to have some bearing on the tactics of the MQM in the future.

SINDHI NATIONALISM

The rise of Sindhi nationalism⁹ is less dramatic and has taken a longer period to emerge than has mohajir consciousness. Sindh's history is said to go back 5,000 years and this region has always been independent and has its own unique culture. Of course this sense of identity has been made impotent by the social and economic system in the region. National identity expresses itself at higher levels of social and economic development when there is a dominant bourgeois and petty bourgeois section to lead and organise the struggle.¹⁰ Since this class has been weak or non-existent it has not been able to dominate the politics of Sindh in the past and is only now beginning to assert itself somewhat aggressively.

The 'movement' against the separation of Karachi from the rest of Sindh in 1948 could not have succeeded for a mere handful of Sindh feudals and their 'intelligentsia' were no match for the dominant mohajirs and their state. The demand to have Sindh as the language of the province following the successful move by the Bengalis in 1952 to have their language given equal status to Urdu, may have given a great deal of hope to the aspirations of Sindhis, but a very small petty bourgeois class could not have won the right to have its language imposed on those of a stronger community. The anti-one-unit struggle saw the beginnings of the emergence of a clearer, broader Sindhi consciousness something that Bhutto recognised and exploited. Although their attempts failed, this class was only now strong enough to challenge the Urdu speakers and to have Sindh recognised as the official language of the province.

Bhutto certainly played a major role in crystallising Sindhi consciousness and Sindhis were given jobs with access to financial resources and to Islamabad. Money did come into the province, thus giving an impetus to the formation of modern classes. Those on the extremes of the agricultural echelon were free to leave and a bigger

bourgeois and petty bourgeois class emerged. The seeds of a concrete Sindhi consciousness were beginning to take strong root. The death of Bhutto and the treatment by the Punjab and its army—to counter the nationalists who were always labelled as traitors—resulted in a further concretisation of Sindhi consciousness. The 1983 movement was the main outcome of the results of these developments when Sindhi nationalism was at its peak, though still unorganised [Ahmed 1983, Ahmad 1984]. (One of the results of the happenings in Sindh under martial law was the selection of Mohammad Khan Junejo, a Sindhi of no real consequence, as prime minister in 1985. Junejo also appeased the Sindhis and continued to play a role somewhat similar in form to Bhutto's. Today Sindhi nationalism is the dominant political philosophy in the province and is slowly cementing itself further still. The problem still seems to be one of organisation where no single party has emerged as a representative of this consciousness.)

ROLE OF STATE

The nationality question cannot be understood without an appreciation of the role of the state in the Pakistani context. Its overdeveloped nature and its omnipresence determine the economic and political course taken by various ethnic groups in Pakistan.¹¹

The state is the biggest employer in the country and through its institutions has helped determine the path followed by the private sector. From the early days of independence, the state tried to help private enterprise to develop, but these attempts failed and the private sector was not able to evolve into a strong and viable entity. The state then increased its efforts to promote private enterprise not only by providing heavy tariff protection to numerous industries and by giving tax exemptions and various other incentives, but also by setting up industrial projects on its own and then handing them over at concessionary rates to the private sector. Under Ayub Khan the state continued to pamper the industrialists with its protectionist policies and with bonus voucher schemes and significantly helped the private sector prosper. In the agricultural sector too, the state provided infrastructure and machinery to entrepreneurs in order to promote modern farming. Although the private sector in this period began to establish itself and to flourish, the role of the state and of the bureaucracy increased substantially. Licensing, permits, foreign exchange regulations, quotas, etc., were instruments where the state could guide the private sector in the direction it wanted and thus held substantial control over it [Amjad 1982, Ahmed and Amjad 1984, Noman 1988].

In the Bhutto period this control was more direct with the nationalisation policy of the government and with greater controls over

also provided a very useful opportunity to repay those who had brought the government to power and to co-opt those who could have been a potential threat. This was now easier with a larger state sector, where now even banks, insurance companies, schools, hospitals and other sectors were incorporated and added to the domain of the government. Whereas earlier the state sector's scope was limited, it was now in a position to provide employment to the large petty bourgeois and bourgeois section which had recently emerged. The government's potential use of this sector was now enormous.

Despite attempts to denationalise in the Zia period, the state sector's importance grew. The bureaucracy and the military, the only institutions which could have threatened Zia and his coterie, had to be appeased and it was feasible to give them more power and control. Military personnel, both retired and on active duty, were given lucrative assignments in most state enterprises or were made Zia's advisers and ministers or were his ambassadors abroad. Various new schemes devised under the broader rubric of Islam and supported by government money were means to give employment to those who could pay some service to Islam and to the military [Babar Ali 1987b, Zaidi 1988]. The victory of the Peoples Party in Sindh and at the centre resulted in yet another massive inflow of party supporters to some or the other department of the state, while in the Punjab the Islami Jamhoori Ittehad (IJI) repaid its supporters in the provincial ministries. Given the inability of private capital in Pakistan to generate substantial employment (not that this is its responsibility) the state sector continues to absorb the increasing labour force and is a useful and lucrative arena to deliver patronage which all governments have made use of effectively. However, the situation is now reaching saturation point and a crisis is inevitable.

In the interior of Sindh, the presence of the institutions of the state is more marked for there seem to be few alternate sources of employment. Access to this sector is perceived as each individual's birth right (as it is all over the country) and thus the fact that the state is unable to provide jobs at the present stage is not seen as a signal to find other employment but to wait and to find some influential who can have the job done.¹⁷ Apart from a handful of factories in the interior of the province (i.e. excluding the larger cities of Sindh which are mohajir dominated) there does not seem to be much private industry catering to local Sindhis. What is even more interesting is that most industries in Sindh are Punjabi owned and the owners have imported Punjabi manager-technicians and labour which has only aggravated the problem of the Sindhi unemployed.¹⁸ Sindhi capitalists are still mainly agriculturists and are revolutionising production on the land but are slow to move into industry. Thus employment

is in fact aggravated by agriculture which has been displacing labour which has not been absorbed elsewhere. The result is greater unemployment and even more expectations from the state.

Among the Sindhi nationalists many are students, aspiring teachers, doctors, professionals etc. a large part of whom are unemployed. (In the absence of a strong bourgeois class, the Sindhi national question seems to revolve around the employment of the petty bourgeoisie [Zaidi 1989].) Their leadership comes from the feudals, but is now increasingly coming from the middle class (i.e. sections of the bourgeoisie and petty bourgeoisie). Due to the pressure applied by the newly emerging Sindhi petty bourgeois class in the last few years in the interior of Sindh, there has been some change in the composition of the institutions of the state (the police, district administration, departments of government public corporations) and a greater number of locals have been given jobs. Even under Zia's rule when the military protected and promoted Punjabi interests in Sindh, Punjab's government from 1985-88 was forced to give jobs to Sindhis in the province, a move which deflated the sails of the movement for national rights in Sindh. In Karachi since 1987 (when the MQM won the local bodies elections) there has also been a greater induction of mohajirs into institutions under the local government. But as there are many more who are pure to government jobs, the recent intake has only been able to solve a very small part of the unemployment problem.

As the Sindhi petty bourgeois is freed from the land and turns to urban employment, his only expectation for employment is from the state as no alternate channels exist. As the Sindhi bourgeois is not investing in industry in the interior, it will still be a few years before the private sector begins to develop and until that time at least, the state sector will be seen to be the only saviour. Given the limited capacity of the state sector, unemployment has persisted causing discontent and resentment amongst those who have been left out. At present there is a dilemma in all this: that since the government is perceived to be Sindhi (and a very large number of Sindhis have been provided with jobs) there is less resentment directed against it compared to what one would expect against a non-Sindhi one. However, unemployment grows and the inability to provide jobs to all will give rise to sympathy and support for the nationalists. A natural outcome of this, for the time being at least, is that Sindhi nationalists will capitalise and target their anger against the mohajirs and the Punjabis rather than examine the roots of the problem.

DEGREE OF VIOLENCE

One important feature of the events over the last few years is the degree and nature

of the violence. The extremely brutal atrocities carried out by members of the MQM and of the Peoples Party on the other, are not specifically related to the 'struggle' for national rights of either the Sindhis or the mohajirs. These forms of violence exist apart from the struggle for national rights and are an outcome of a suppressed culture and of warped development which has emerged over the last few years and afflicts all sections of society equally [also see H. Ahmed 1990]. In fact, the extent of violence is one major reason why the Sindhi-mohajir conflict has acquired much publicity in the first place and has exaggerated the extent of the real conflict between the two communities.

Violence is endemic in all forms of protest and dispute within Pakistani society. It need not be the Sindhi-mohajir conflict, even democratic forums are permeated with substantial degrees of violence. Whether in national elections, disputes within trade unions or student groups, or sectarian differences, the only means of settling accounts is through violence. A few years ago differences between groups were settled by fights or at worst, knives and brickbats. Now Kalashnikovs help settle scores. Arms and ammunition are available in abundance in varying quantities all over Pakistan and no single political group can hope to demonstrate its power unless it displays and uses its armed strength. Since political parties have access to arms, their student, trade union, and other social organisations which they patronise are also provided with the same. There is so much ammunition in Pakistan today (and especially so in Karachi) that those who do not have an organisation or the means to acquire arms outright can always hire it by the half dozen at rates cheaper than those for car rentals.

Pakistani society has been brutalised over the last decade thanks mainly to military rule. It was not just political suppression which has now resulted in this extreme release of energy in the form of violence, but equally importantly, cultural, academic and social oppression under the military has given vent to violence. To justify their rule the military used Islam as a means to control the people of Pakistan where all forms of healthy expression were suppressed. Music, sport, the arts, culture, all had to subscribe to some medieval Islamic code. At the same time, graft and corruption took deeper root in society where heroin and arm mafias were encouraged and given state protection. There was no channel for complaint or redress and certainly no semblance of participation or accountability of any sort. Might, in the guise of the military uniform, became the sole arbitrator of morality and justice [O. A. Khan 1985, Haque 1985, 1988].

While this suppression in the name of Islam continued, a different sort of parallel development was taking place underneath. The Middle East phenomenon along with the increasing amount of money which was

being made from smuggling (mainly arms and heroin) gave rise to a middle class in the cities which was acquiring different values. This new found consumerism with its access to a wide world via the parallel media presented a different picture to the one being packaged at the official level. In the larger cities especially, it was the development of this new, modern, Michael Jackson and Sridevi video culture, along with its fall-out which was causing a development which was antagonistic to the one being officially propagated. Furthermore, as urbanisation was proceeding at phenomenal rates, old values were being forced to confront a completely new world [A Ali 1987, Hasan 1987b, Hasan 1990]. Once the Middle-East money started running out, the aspiring middle class became more concerned with admissions, jobs, inflation and insecurities. The alienated unemployed youth symbolised this anger and frustration with few avenues to make its voice heard. The result was an internalising of the contradictions which found release in violence. (Amongst political groups it is the MQM which best symbolises this urban phenomenon with its anger, frustrations and violence)¹⁵

Violence begets violence and once started has its own dynamics. That is what is happening in Sindh today. There are extremists on both sides of the ethnic divide and if one examines the anatomy of large scale massacres, we realise that they too have little to do with national rights.¹⁶ It would be foolish to say that there is no Sindhi mohajir problem for there is one. However presently it is based less on the struggle of national rights and more on revenge and on the repercussions of violence. There is hatred, but this too has been artificially created where the media has played a very prominent role in this [Abbas 1990a, 1990b]. Thus the degree of violence (and the resulting hatred) which plays such an important role in the Sindhi mohajir conflict needs to be seen as a part of the degeneration of Pakistani society. Moreover, as I argue, it also becomes a necessary weapon in the hands of some groups whose existence and survival depends on now effectively they can terrorise their own people and their 'enemy' and on how efficiently and quickly they can resort to violence.

ELECTIONS AND THEIR AFTERMATH

The elections of November 1988 announced the dawn of a new era in Pakistan where a democratic process, albeit of the most perverted kind, got underway. Speculation from the very day following General Zia's death to the present, regarding the ambitions and designs of the army, continue. The possibility that the army may abort civilian rule in Pakistan on one of many pretexts, is always very high, but given the persistent compromises of the civilian government with the army, it seems more probable that the democratic experiment may be permitted to continue for some time yet.

For Sindh, the elections quite clearly announced that the province was divided on ethnic and urban/rural lines. The MQM reiterated its claim to being the sole representative of the mohajirs in urban Sindh, while the Pakistan Peoples Party trounced the nationalists and the remnants of the Zia regime convincingly in the Sindhi dominated rural areas.

The defeat of the nationalists in Sindh has been misinterpreted as a rejection of nationalism in favour of federalism, a view which has been propagated mainly by the Punjab and by the establishment. This perception is incorrect. The Sindhi Peoples Party candidates were as nationalist as their opponents. While campaigning, both raised similar slogans and demanded autonomy for Sindh, were against the repatriation of Biharis and were opposed to the construction of the Kalabagh Dam. What went in the favour of the Peoples Party candidates against the nationalists was not only the fact that the Peoples Party in Sindh was sufficiently nationalist, but it was also perceived to be federal enough and in the event of victory at the national level would be in a position to redress some of the grievances faced by Sindh and the Sindhis. The Peoples Party had at least two other advantages which the nationalists did not: the revenge of Bhutto and the fact that the nationalists were thoroughly disorganised and confused about the election issue altogether. Thus at the time of the elections, nationalism was an important political force in Sindh (if not the most important one) but was not then an electoral force. However, as I show, things are changing.

The MQM PPP alliance which offered a real possibility of peace in a province ravaged by violence was short lived. The major responsibility of this break down lies with the Peoples Party and particularly with Benazir Bhutto, whose short-sightedness gave rise to an attitude uncalled for. A more accommodatory stance permitting the MQM, the PPP's main supporter and other groups like the Jamiat Ulema Islam, to share in the semblance of power, could have gone a long way in solidifying Benazir's own sense of governance and would have helped ease the tension in Sindh. However, the treatment meted out to her main allies was indeed distasteful [Babar Ali 1990]. The MQM was forced to leave the alliance but blundered into another one with the IJI and the Combined Opposition Parties (COP). Once the MQM was thrust into the opposition camp, and given the history of violence in Sindh, it was clear that things would take the turn they have.

The MQM was isolated from the political process in the country as well as from its constituency once it ended its accord with the PPP and this isolation continued with its COP accord. The failure of the no confidence vote against Benazir in November 1989 was a major disappointment for the MQM for it had been guaranteed victory. At the same time, the attempt by the

COP to oust Benazir had positive effects on her own party within Sindh. The militant Sindhi lobby in the Peoples Party in the National Assembly was very upset over the alliance between their party and the MQM. They perceived this to be a betrayal of the Sindhi cause and their displeasure was so strong that they had decided to oppose Benazir in the no-confidence vote. Benazir would probably have lost the vote but was saved by the ill timed announcement of the IJI MQM accord. Once it was made public that the Punjabis and the mohajirs had gotten together it was quite clear that no matter how strong their displeasure, the Sindhis would never vote for the ethnic groups which were out to 'annihilate' the Sindhi 'nation'. There was a realignment of ranks and the militants grumbled but withdrew and voted in favour of Benazir. This then resulted in the emergence of a stronger more united Peoples Party in Sindh which also took some wind out of the nationalists' sails as it emerged a more genuine Sindhi party antagonistic to the MQM.

SITUATION TODAY

I have tried to argue in this paper that the Sindhi mohajir conflict is not the primary contradiction in the province, and the conflict, which today revolves around violence, has to a large extent been artificially created for which the MQM is most responsible. The MQM is a fascist organisation for whom violence has become an important vehicle to prolong its control over the mohajirs of Sindh. Certainly the mohajirs, like all other communities in the country face growing economic and social problems. The MQM did have populist electoral support and is the only representative of the mohajirs for it has raised issues which concern this ethnic group. It was able to do so because mohajirs are more concentrated in certain areas (cities and towns) and are thus more easier to organise than other groups, and also because there has been a persistent crisis of identity in this community. The reason why it now requires violence to continue its hold is that the MQM has failed to deliver the goods to its constituency since it was elected for the first time in the local bodies elections of 1987 [Aslam 1988, Hasan 1988a]. After victory in the national elections a new wave of expectations rose but fell away following yet another failure of the elected representatives to achieve anything productive. The leadership of the MQM certainly does not want to lose its hold over the millions of its constituency and so terrifies its people by making use of a false sense of threat. It builds these straw-men (at present the Sindhis, which have been preceded by the Pakhtuns and by the Punjabis) and literally shoots them down. Violence has been the most consistent factor in the politics of the MQM and it is the fear of more violence and thus the need for protection which forces the people to continue their support for this organisation.¹⁷

tic. Controlled violence may be politically feasible and productive but once it gets out of hand, tactics have to be changed. The violence in Sindh at the moment has acquired its own terrifying logic and is now hitting back at the supporters of those who instigate and perpetuate it. Hyderabad has been economically paralysed since September 1988 and the (primarily) mohajir community is feeling the crunch, as it is in the smaller towns of Sindh which are integrated with Hyderabad. Karachi has also suffered due to curfew and violence and although it is difficult to quantify capital flight to the Punjab, there are more than a few cases of this [A Ali 1987, Sheikh 1989].¹⁸ Thus the mohajirs more than any other community in Sindh suffer the violence created by their own party. The result will have to be either compromise or anarchy. The MQM will have to change its image and its political line and deal with the real issues in a more mature manner—the killings of Sindhis is no solution to any of the mohajir problems.

If at all there is a contradiction between the mohajirs and another group, it is with the Punjabis. Since the Sindhis are peripheral to the economy of Sindh, the mohajirs need not really be concerned with the aspiring Sindhi's economic challenge. The Punjabis are another matter. Here there are real issues between the two communities regarding jobs, admissions and economic and political power especially in Sindh, but also in Pakistan as a whole. The fact that the MQM is not dealing with the real threat puts into question its true role in the politics of the country.

The Sindhi nationalists are also misdirected for their struggle should be one jointly with the mohajirs against the Punjabi dominated centre as they are not in a position to achieve anything on their own. The biggest theoretical mistake the Sindhi nationalists are making is that they are anti mohajir. The politically correct and most productive form of Sindhi nationalism is an alliance with the mohajirs against the state and the centre. Certainly, the present conditions do not favour rationality and logic as emotions rule politics. The politics of violence propagated by the insecurities of the MQM benefits Sindhi nationalists who are growing at the expense of the Peoples Party. This has repercussions for government at the central level where a more weakened Peoples Party will be even less able to govern. The Peoples Party is faced with a Catch 22 situation: if it appeases the MQM and tries to find a solution to the present politics of violence, it alienates Sindhi nationalists including those inside its own organisation. If the Peoples Party ignores or confronts the MQM (as it has been doing recently) it may acquire some sympathy from Sindhi nationalists, but it then helps destroy Sindhi economically thus affecting its own constituency. At the moment, however, the short sighted interests of the PPP seem to favour the latter alternative and act as a hurdle in

A major bone of contention between the Sindhis and the MQM is the MQM's demand that it be recognised as the fifth nationality of Pakistan.¹⁹ Since all Sindhi nationalists have pressed for the recognition of national rights and the reallocation of provinces along 'national' lines, the recognition of the mohajirs as a nationality will result in the demand for a mohajir province. The partition of Sindh is not in the interest of Sindhis and for this reason they will oppose it.²⁰ The MQM's *raison d'être* is mohajir nationalism and although there are indications that their leadership may slowly withdraw from the demand of a province or the recognition as the fifth nationality,²¹ the change in emphasis within the MQM will be slow in coming. Until then the present conflict in Sindh will continue unabated.

There are a few, final, persistently nagging questions which need to be addressed which have kept conspiracy theorists preoccupied. If the essential premise of the arguments presented here is that the primary contradiction in Sindh is not between the Sindhis and the mohajirs but between the residents of Sindh against the state and the centre and thus by association, against the Punjab, the questions which then need to be confronted are why indeed, is there such a severe Sindhi mohajir problem in the first place? Are there any forces behind this and is this violence serving their interests? Why is there no Sindhi Punjabi or mohajir Punjabi conflict?

It is very easy to blame two pet targets—the military and the bureaucracy—for the violence in Sindh as many would like to, but quite clearly, since there is no proof of the involvement of either, one cannot directly accuse them. However looking at whatever evidence there is, and at the various trends which have emerged in the process, one can hypothesise and raise further questions which for the moment must remain unanswered.

Despite the fact that over a thousand people have been killed in Sindh in the last few years, not one person has been brought to justice. Those arrested have been immediately released on the orders of influential individuals. This continues to give rise to speculation that the events in Sindh have been orchestrated by some powerful institutions which benefit from violence—essentially the army, the Inter Services Intelligence, and other anti democratic forces.

The army is now in a position to halt the experiment with democracy and there are growing demands from sections of the public for it to take over control directly. The army was the obvious beneficiary of the Zia martial law and the desire to regain direct control by some active senior generals cannot be ruled out. If, indeed, there is a conspiracy against democratic forces and institutions, the involvement of some sections of the military cannot be precluded. Other beneficiaries of the present conflict in Sindh

Peoples Party rule. The ruling sections in the Punjab also benefit from this violence, especially in Karachi, as capital shifts to Chunia and other parts of the Punjab. Although one cannot accuse any of the possible beneficiaries of the violence in Sindh, too many questions persist.²²

CONCLUSIONS

The unpredictability of events in Sindh and the country give rise to many possible scenarios in the future, some inherently contradictory. In Sindh and in Islamabad, the growth and concretisation of the Sindhi bourgeoisie will give rise to a potential strengthening and maturing of the forces of Sindhi nationalism. As Sindh develops economically, and despite the emergence and existence of nationalism, there will be greater integration with the rest of the country. Sindhi nationalism as a separatist trend which is presently steeped in romantic notions having little to do with material reality, will die its natural death. The Sindhi bourgeoisie will realise that it is in its interest to deal with the Punjab and with Karachi and compromise with the exploiting nationalities rather than lead a movement for the independence of Sindh. However, given the present level of the development of productive forces, this strategy will establish the Sindhi bourgeois as subservient to the mohajir and Punjabi capitalist. On the other hand, if the Sindhis want to dominate the interior of Sindh (for they will not be in a position to dominate the cities which are already in mohajir Punjabi control), they will have to make an alliance with the mohajirs to deal with Punjabi domination in the province and at the centre.²³

This first possibility, of more integration with the rest of the country despite a greater emergence of the forces of Sindhi nationalism, is likely only if the PPP stays in power in the province and at the centre. The other possibility, almost opposite to the first, would arise if the present governments were removed by the military or by a non Sindhi opposition. In this case, the bourgeoisification of the Sindhis will slow down resulting in a very distinct probability (with Sindhis already a minority in their province and very weak economically, and given competition from the mohajirs and the Punjabis), that a strong bourgeois class may not emerge like its counterpart in the other nationalities and the Sindhis may well become extinct as a political and economic entity altogether. This will signal the beginning of the end for the Sindhi nation. In this event, the economic development taking place in Sindh will be co-opted by the mohajirs and the Punjabis who would strengthen their hold over the province. This scenario would be possible in the long run, but if this trend were to emerge, one can safely predict the short-run effects out of desperation the Sindhi nationalists will resort to violence and attack mohajirs and Punjabis in the pro-

vince. Indeed, a scenario which does not augur well for the people of Sindh

If the democratic process is permitted to continue, after a few years there is a possibility that extremism in the nationalist movement may give rise to saner politics. In the meantime, however, neither will Sindh be divided nor will mohajirs get any more rights than they already have. The end result will be greater bloodshed over relative non-issues followed eventually by a coalescing of interests by the two communities against the domination of the centre. A lack of political participation and accountability have given rise to the only form of discipline known in Pakistan that of might and suppression packaged in violence. Today all communities are only following the methods prescribed by history. If other norms such as democracy take root, other channels of redress will probably be found. As the Sindhi bourgeoisie asserts itself, the centre will have to share greater power and the Punjab will have to release its hold as it did to accommodate the Pakhtuns. In the long run, greater autonomy, more sharing and more pragmatic and accountable government are the minimum criteria for a solution to the problems in Sindh. In the short run, however, there are no solutions.

Notes

[This is a revised version of a paper presented at the Democracy and Development in South Asia Conference, Tufts University April 20-22, 1990. This paper was revised in this form prior to the dismissal of the Peoples Party government on August 6, 1990. This paper is also to be included in the published Conference Proceedings to be edited by Ayesha Jalal and Sugata Bose. I am very grateful to Zareen F. Naqvi and to Ayesha Jalal for some excellent comments on an earlier draft which have helped improve the quality of the paper appreciably.]

- 1 To keep the paper to a readable length I have purposely simplified issues which have been documented and dealt with elsewhere and here I concentrate on issues which have not been written on in the past. This is also the reason why I have had to refer to numerous periodicals and newspapers for first hand information.
- 2 For differing perspectives on the mohajir question see Ahmed 1988, Arif 1988, Alavi 1989, Hasan 1987a, 1988b, 1989.
- 3 Not all refugees who came to Karachi were Urdu speaking as Memons, Gujaratis, Bohras, Kathiawaris also came. Despite the differences between them and the Urdu speakers, for the purpose of analysis they are all now included in the broader political term mohajir.
- 4 There was an urban bourgeois class in Sindh, but it was mainly Sindhi Hindu which migrated to India at the time of partition. It was the Sindhi Muslim who had still not evolved as a well defined bourgeois class. (I am grateful to Theodore P. Wright for this communication.)
- 5 Punjabi intellectuals have been smitten by the MQM because of its class background and have even called it a progressive party

but have overlooked the fascist tendencies inherent in it.

- 6 Altaf Hussain in an interview in *Herald*, September 1987.
- 7 Here I cannot agree with Farooz Ahmed who laments the fate of Sindhis with respect to Karachi when he says "Sindhis in Karachi were turned into strangers in their own town" [Ahmed 1984b, p. 17]. In this and in other articles [Ahmed 1985b, Ahmed 1988], he argues that Karachi was a Sindhi city, a perspective which finds little support from the facts of history.
- 8 See A. Nasir in *Herald*, March 1990. For charges of corruption against senior Peoples Party officials see *Herald*, June 1990. *The Friday Times*, June 28 July 4, 1990, June 21-27, 1990, A. Amir in *Dawn*, May 14, 1990.
- 9 For more details see Ahmed 1972, 1983, 1985b, Ahmad 1984, Babar Ali 1986, 1987a, Arif 1988, Zaidi 1990. Also, for a particularly brilliant and original analysis of the development of capitalism in Sindh, see Aili 1990.
- 10 A feudal nationalism can also exist, as it has existed in Sindh in the past. But this is, in general, a less organised, less effective nationalism, compared to the more advanced bourgeois nationalism. Nationalism is essentially a concern of the bourgeoisie.
- 11 Also see Alavi 1983, Ahmed 1985a, Hussain 1985, Jalal 1990.
- 12 One of the more serious newspapers quoted the price for a number of government jobs which could be acquired through elected representatives. *Dawn* February 27, 1990.
- 13 I have argued elsewhere that one reason for Punjab's prosperity today is this ability to export its surplus population and keep unemployment low [Zaidi 1989].
- 14 Mahnaz Ispahani writes "Domestic violence in Pakistan has been fired indirectly by Pakistan's role as a base of operations and as a weapons conduit for the Afghan Mujahideen. Along with the arms sent in to Pakistan through pro-Kabul Pakhtun tribesmen by the Afghan regime an estimated 40 per cent of the weapons destined for the war effort have 'leaked' into Pakistan. Pakistani army officers and Mujahideen have been reported to sell weapons on the open market in Pakistan. Drug traffickers, right wing Islamicists, frontier warlords and rural bandits have all gained access to sophisticated arms ranging from Kalashnikovs to rocket launchers and anti-tank missiles. Lawlessness is worst to day in Sindh" [Ispahani 1990, p. 27].
- 15 According to Arif Hasan, one of Pakistan's leading social scientists, the violence caused by urbanisation is going to be replicated in a number of cities in the Punjab as well.
- 16 The Hyderabad massacre of October 1988 is said to have taken place because one faction of a Sindhi nationalist group taunted the other for not being "men enough" regarding the Sindhi "cause". This group went out to prove its credentials by killing 200 mohajirs.
- 17 Even the educated and the professionals amongst the mohajirs justify the tactics of the MQM as they argue that had the MQM no existed mohajirs would have "suffered" more.

18 *India Today* quoted a spokesman for the Chamber of Commerce and Industry who said that "only two of the 63 new textile mills set up in Pakistan have been installed in Sindh in the last year" June 15, 1990, p. 10.

19 See interviews of G. M. Syed, *Herald*, August 1989, Ibrahim Joyo, *Herald*, January 1990, Makhdoom Khaliqurrahman, *The Friday Times*, March 17, 1990.

20 Although Sindhi nationalists recognise Seraiki as the fifth nationality of Pakistan and accept their claim to territory as legitimate, under no conditions are they willing to give up their own lands for the creation of a Seraiki province.

21 Altaf Hussain in a recent interview said that he had never demanded either a mohajir province nor recognition as a nationality (*The Frontier Post* Lahore, March 9, 1990).

22 One of the few blessings of democracy has been a relatively free press resulting in analysis which has not only been critical of the government but at times, also of the army. In the context of the violence in Sindh, the army and the ISI have been alluded to, implicated, and even accused on more than one occasion. *Newsline* and *Herald* in the months of May, June and July 1990, have carried at least one suggestive piece per issue. *Newsline* in its March 1990 issue even identified an active Colonel, who was said to be directly responsible for the violence in Hyderabad. Also, other publications such as the Lahore based *The Friday Times* have also come up with similar theories (see the *TFT* of June 14-20, 1990). In an editorial on its front page, the *TFT* said "There is substance too, in the PPP's

READINGS IN DECENTRALISED PLANNING

With Special Reference
to District Planning

Edited by
B.N. Yugandhar
Amitava Mukherjee
(in 2 Vols)
Rs 725 per set

Based on the proceedings of the International Experts Group Meeting on Decentralised Planning held at the Lal Bahadur Shastri National Academy of Administration Mussoorie from 11th to 13th June 1990. The sweep of the papers cover everything relevant currently for district planning: the concepts, the resources, the database, the role of the administrator, the training needs, people's participation, agro-climatic zones and the know-how to frame a district plan.

allegation that the MQM, its genesis in Sindh, was sustained by the ISI under Zia" (TFT, July 12 18, 1990)

- 23 Despite obvious differences, there is an interesting parallel with the Pakhtun issue which may give some possible insight into the nature of events in Sindh. The Pakhtuns too had a militant anti centre anti Punjabi nationalist bourgeois and petty bourgeois class whose representatives had spoken of secession on numerous occasions. Today these classes are the biggest beneficiaries of the bourgeoisification of Pakhtun society and of its integration with the Punjab and with the centre at Islamabad. Now few Pakhtuns talk of secession. National rights are seen as part of the federal structure of Pakistan and the Pakhtuns are interested in extracting a greater share from within the present union [Zaidi 1988 1989]

Lopsided Growth

Political Economy of Indian Development

by Pradhan H Prasad

This collection of essays in political economy unravels the forces which have acted as a drag on Indian development. The Achilles heel of Indian development plans—the author argues—has been their preoccupation with investment planning to the neglect of institutional transformation. Within this broad framework the author discusses a wide range of subjects including macro-economic plan models, choice of techniques, the persistence of outmoded production relations in agriculture, growing political assertion by the middle peasantry, roots of agrarian violence and uneven regional growth.

Ambedkar and Buddhism

Dharmachari Lokamitra

THE second section of Gopal Guru's note on the 'Hinduisation of Ambedkar in Maharashtra' (*EPW*, February 16) deserves a reply. This section concentrates on attacking Trailokya Bauddha Mahasangha Sahayaka Gana (TBMSG). Guru has based this on Vinay Kamble's articles on TBMSG in the Marathi magazine (now defunct) *Dharmalipi*. It seems he has not read any of the many publications brought out by TBMSG; otherwise one presumes he would have referred to them in his notes. The only conclusion one can reach is that he has not tried to establish the veracity of any of Kamble's points. This is in itself a very improper approach to criticism and leads one to doubt the real intentions behind writing such a report.

The first criticism is concerned with "spiritualising the dalit masses in the State [of Maharashtra]". The word spiritual is admittedly rather confusing although it is often used in TBMSG. Millions of people have converted to Buddhism since 1956 following the example of Ambedkar. He was very concerned that his followers take the Dhamma seriously, otherwise, he said, "people will laugh at this conversion".¹ To this end he wrote *The Buddha and His Dhamma*,² a 'puja' book³ and gave them 22 vows⁴ to follow. The latter besides repudiating the worship of the Hindu gods, include a commitment to the practice of equality, the Buddha's Eight-Fold Path, the Ten Paramitas and the Panchasheel. It was clear that to Ambedkar there could be no Buddhism without the practice of the Dhamma, which if practised systematically, gradually bring about highly positive and creative changes in one's mental states and attitudes, enabling one to take more control over one's own life and to help others more effectively. It is this process that is meant by the word 'spiritual', but as it is used in other religions with completely different goals, it is not a very satisfactory word.

Gopal Guru uses the word 'dalit'. In my experience most Buddhists in Maharashtra do not like to apply this word to themselves, as it refers to them in terms of what they are trying to leave behind, and not in terms of their new-found dignity as human beings insisted upon by Ambedkar and encouraged by their conversion to Buddhism.

TBMSG holds regular Dhamma shibirs, open to all, during which, according to Gopal Guru, "the participants are asked to undergo transcendental meditation to

overcome material as well as mental problems". Transcendental meditation is what the Maharishi Yogi's system is called and consists of mechanically chanting a mantra. TBMSG's system of meditation is quite different. It does not consist of chanting a mantra and going into a trance as Gopal Guru makes out. Meditation in Buddhism is a conscious process and does not involve going into a trance-like state. Two most traditional Buddhist meditation practices are taught in these shibirs, the Mindfulness of Breathing and the Maitri Bhavana, or the cultivation of an attitude of universal loving kindness. These states of mind are basic to Dhamma practice. Ambedkar emphasises the development of these states of mind in *The Buddha and His Dhamma*. On page 87 he talks about the importance of Samma Sattu, or Perfect Mindfulness. On page 265 he develops this further under the heading 'Thoughtfulness and Mindfulness'. As for the question of maitri, attention may be drawn to the section entitled 'Dhamma to be Sad-dhamma Must Promote Maitri' starting on page 210, and also to page 413 where he gives the most famous of the Buddha's teachings on 'maitri'. But these are only to illustrate the point. References to these two states of mind fill the book. Meditation is a tool for the systematic cultivation of these higher positive states of mind, and as such it is central to serious Buddhist practice. It may be possible to develop these elevated and highly positive states of mind without formal meditation practice, but for most people that is extremely difficult and open to rationalisation.

Gopal Guru's next criticism is to accuse TBMSG of stripping off the political content of Ambedkar's philosophy. Ambedkar started a many-faceted movement. TBMSG does not pretend to work in all these areas. It is especially concerned with the area of Buddhist teaching and practice which had been largely neglected since the conversion. An incident told by Nanakchand Rattu, Ambedkar's personal assistant, and verified by others who were present, throws light on Ambedkar's own attitude. Some of his followers were trying to persuade him right until the last minute to postpone the conversion until after the next elections. He was upset with them, saying that they did not understand the importance he attached to Buddhism. Since then, compared to the energy that has gone into politics, very little has gone

into trying to understand and practise the Dhamma.

Gopal Guru is right in maintaining that Ambedkar did try and bring out the social aspect of the Buddha's teaching, which has been somewhat neglected in recent times and for this the Buddhist world is increasingly grateful. Today Buddhism is very popular in the West, and there is a great deal of importance attached to the social implications of the Buddha's teaching. In this sense Ambedkar could be said to be the forerunner of this Western Buddhist movement. At the same time he was quite clear about the basis for social change in Buddhism. In November 1956, at a World Fellowship of Buddhists' Conference in Kathmandu, he made the following statement: "The greatest thing the Buddha has done is to tell the world that it can only be reformed by the reformation of the mind of man, and the mind of the world."⁵ Without individual change, in other words, there can be no social change.

A major part of the work of the TBMSG in India is its social wing, known as Bahujan Hitay. Today 10 hostels (there are plans for many more) in Maharashtra and elsewhere as well as extensive health and educational work in the slums of Pune are being run. All this work is run by local practising Buddhists who are followers of Ambedkar. They see this work as an inextricable part of their Dhamma practice. Meditating on 'maitri' and 'karuna', one cannot close one's eyes to the condition of people all around. To say that TBMSG is making the "dalits quite insensitive to the problems of dalits" is therefore quite untrue. It seems neither Gopal Guru nor Vinay Kamble has any knowledge whatsoever of TBMSG's extensive social work.

I am not quite sure how Gopal Guru can state with such certainty that "not one among the followers of the Sangha protested against the government's decision to delete the 'Rama Krishna Riddles' from Ambedkar's writings". There were lakhs of people protesting. TBMSG runs perhaps a hundred Dhamma classes a week in Maharashtra, to say nothing of special lectures and lecture series. Can he say categorically that this subject was not taken up? The quarterly *Golden Drum*, published by TBMSG in London had a special report on the Riddles affair.⁶

But while protests may help, to enable long-term effects other substantial and constructive work is required. The problem starts with followers of Ambedkar themselves. Ambedkar emphasised that his followers must get rid of their belief in god. The first few of the 22 vows deal

the old gods it presents a problem. One is still effectively a Hindu, and in Hinduism one's place is still right at the bottom. By worshipping the old gods one is thus continuing to wear the old religious shackles with all their psychological effects that have been worn for centuries. More than that, belief in god, being based in superstition, opens one to all manner of exploitation. Ambedkar felt so strongly about this that he said in *The Buddha and His Dhamma*, "belief in god is the most dangerous thing" (p. 178).

But the sad fact is that many Buddhists still worship the old gods, thus unwittingly maintaining the old religious conditioning. In the last 12 years perhaps several thousand people have attended Dhamma shibirs organised by IBMSC, where they both learn meditation and study a Buddhist text or something written by Ambedkar on Buddhism (the atmosphere is far from restrictive as implied in Gopal Guru's note, but is pervaded by a joy and a sense of meaningfulness that few have experienced before). Perhaps the most universal experience for those who have attended such a shibir for the first time is understanding how Ambedkar could say in the 22 vows: "Now I have taken a new life. Buddhism becomes meaningful to them as never before. They begin to understand how through Dhamma practice they can lead much more creative lives than hitherto they had thought possible, and thus develop a confidence in it that many did not have before. Most of them will go home and throw out the pictures and murals of the old gods, having eradicated their psychological dependence on them. Not only that they will pass on what they have learnt to neighbours."

"In this situation, can we dispense with Buddhism? Perhaps not." It seems from this that Gopal Guru really would like to dispense with Buddhism, and that to him it has little of intrinsic value in itself, its only value being as a political tool. He makes this clearer towards the end when he suggests making changes to the most basic Buddhist principles. He wants, first, to change the Trisaren. These are the Buddha, representing the ideal of *human enlightenment* to which Buddhists aspire, the Dhamma, the practices leading to that state, and the Sangha, the fellowship of those likewise practising the Dhamma. These ideals are shared by Buddhists throughout the world and are thus a unifying factor among them. The Trisaren as Buddha, Dhamma and Sangha were basic to Ambedkar's approach to Buddhism. Admittedly, at the time of conversion he was hesitant about taking the Sangha saren because he was extremely dissatisfied with the conduct of the present day

bhikshu sangha (he was dissuaded from this course of action because recognition from the rest of the Buddhist world was very important for him). But that did not mean that he did not appreciate the principle of Sangha; he makes it clear that he did in *The Buddha and the Future of His Religion*. He saw Sangha as providing a model of the ideal society, creating a body of deeply committed Buddhists who could impartially guide others, and creating a society whose members were free to render service to the people. That the present bhikshu Sangha was not living up to these ideals was for him a most perplexing question and he called in no uncertain terms for a new kind of Sangha.

Gopal Guru wants to change these three principles to equality, fraternity and freedom. What he does not seem to realise is that these three principles are implicit in the Dhamma itself, and this was brought out by Ambedkar. Therefore, there is no need to change the Trisaren. Liberty, equality and fraternity are implanted within it.

Not only does Gopal Guru want Buddhism without the Buddha, Dhamma and Sangha, but he wants to separate Panchasheel from his own version of the Trisaren. Panchasheel is the most basic commitment to ethical behaviour and the foundation of social relations in Buddhism. Gopal Guru states that unfortunately the contemporary Buddhist leadership in Maharashtra still argues for the combination of Trisaren and Panchasheel which, in effect, has led to the regression of Buddhist move-

ment in Maharashtra and suspension of Ambedkar's project of converting Hindu Indian into Buddhist Indian. No one who has read even a little of what Ambedkar wrote on Buddhism could possibly go along with this view. Morality was basic to Buddhism according to Ambedkar. One quote from *The Buddha and the Future of His Religion* is enough to show this: "The religion of the Buddha is morality. It is imbedded in religion. Buddhist religion is nothing if not morality. It is true that in Buddhism there is no god. In place of god there is morality. What god is to other religions, morality is to Buddhism."

I am afraid the project Gopal Guru is talking about is not that of Ambedkar but of those who have attempted to usurp Ambedkar's conversion to Buddhism to serve their own political ends. One would have hoped for a little more substance in his arguments.

Which is the best place to start a chemical industry?

Pashamylaram in Andhra Pradesh.

Because you couldn't ask for more.

This sprawling 200 acre industrial estate situated on the Hyderabad Bombay National Highway 9 comes equipped with common effluent treatment plants pollution control systems steam and refrigeration plants a captive power plant if necessary and believe it or not housing for the employees schools shopping centres medical facilities and beautifully landscaped surroundings. In a nutshell it's a virtual ready to start production deal you're getting.

And take a look at APIIC's enviable track record.

The Andhra Pradesh Industrial Infrastructure Corporation Limited is an organisation with an excellent track record for providing an impetus to industrial growth. 18 600 acres of land have so far been acquired across the state. And 217 Industrial Estates and Industrial Development Areas have been established. An excellent achievement by any yardstick. Even if we say so ourselves.

So if you're interested in setting up a chemical industry mail this coupon to us for further details.

May 25, 1991

Signs of Change

The shifts in the class and caste configurations in Bulsar, a town in south Gujarat, in the last two decades and the changing social location of Suthars, a caste which pioneered industrial activity in the region, give a clue to the nature of the political-economic transformation taking place

1340

Regulating Rents

Most critics of rent control legislation recommend its abolition arguing that this would improve the supply of rental housing and also lead to a decline in rents in the long run. A critical study of the impact of the Delhi Rent Control Act (1958) and the 1988 amendment do not quite bear out this point of view

1351

China Shakes

If China is shaking the world it is rather because of its exploitation, not its suppression, of capitalism. But while market capitalism and foreign investment may be all the rage today the mood may not last indefinitely

1330

Promise and Performance

The improved efficiency of State level manufacturing public enterprises would go a long way in enhancing the effectiveness of State governments as a whole

M-42

Price of Power

The Karnataka State Electricity Board's decision to hike power tariff has generated much protest. The compulsions and problems of setting tariff rates in the industry

M-51

How does the public sector Bharat Heavy Electricals fare in the power equipment market in terms of product quality performance and price?

M-47

Who Wears What and Why?

Since household textile demand is a crucial factor in the growth of the industry its pattern, quality component and the income and price elasticities need to be understood

M-61

Rein on Funds

With the proliferation of mutual funds, the need to set up legislation to govern their functioning becomes urgent

M-55

Space for the State

The success of privatisation requires not only a reform of the private sector itself, but also an effective state and not, as many see it, a shrinking role for it

1313

Culture-Specific Designs

A universalistic approach to organisation and management is outdated and inappropriate. Today culture specific ideas based on psychoanalytic insights are contributing to the structuring of new models of organisation

M-65

Ambedkar and Congress

While Ambedkar clearly linked the emancipation of the dalits with Swaraj, he was not willing to mortgage their political future to the tender mercies of the upper caste Hindu leadership of the Congress and sought a measure of political autonomy for them through the proposal of separate electorates

1328

Research on Bhopal

The Indian Council of Medical Research's findings on Bhopal clearly show that the gas leak has caused irreversible damage among the population who will need long term care

1322

Phule's Legacy

Many sections of Indian society have been trying to appropriate the legacy of Phule not with a view to continuing his unfinished mission of democratic revolution but to legitimise their own interests

1325

Daunting Prospects

Beyond June the country's economic prospects appear gloomy and the government will have to face the fact that it will have to keep running just in order to stay in the same place. And worse are the longer term prospects unless changes far beyond the immediate fiscal adjustments which the IMF may call for are made

1318

People's Choice

An analysis of the social background of Kerala's newly elected members reveals features not entirely unexpected for that State

1320

Police Action against Dam Oustees

WE strongly condemn the arrest of social activist Kumar Chandra Mardi and 450 tribals while they were protesting against the construction of Icha Dam, a part of Subarnarekha Multipurpose Project, at Icha near Chaibasa, Singhbhum district of Bihar. Financed by the World Bank, the project is a joint venture of the States of Bihar, Orissa and West Bengal.

On April 5, 1991, the local people, mostly tribals, went on an indefinite 'dharna' at the dam-site to stop the construction of Icha dam. The 500-strong non-violent protest was organised by the local organisations to stop the ongoing construction of this dam because this dam will displace 30,000 people, majority of whom belong to the Ho tribe in over 61 villages. So far, the project authorities have not come up with any rehabilitation plans to resettle the displaced people. But the lands of the would-be displaced people are being notified for acquisition and only cash compensation is being offered.

On April 9, the deputy commissioner came with a large police force to evict the protesters. When the protestors refused to withdraw the 'dharna' until and unless their demands were accepted by the project authorities, the police started dragging men, women and children to the police bus which took them to Saraikala police station. Before arresting them the police ransacked the tent meant for lodging the activists and set them on fire. They also harassed the women and separated them from their children. Kumar Mardi and 250 tribals were taken into custody. Since then about 50 people are courting arrest every day against the police action. In a meeting with tribal representatives, Jagnanadh Singh, minister of irrigation, Bihar government, assured the release of social activists and all other arrested people by April 30. But they have not been released as yet.

Recently, several offences involving crores of rupees have come to the light which includes withdrawal of excess payments, illegal removal of government property, filling of fake bank guarantees and of false payments. The parties involved are the contractors, Surya Construction and Ganimon Enterprises, the executive engineer of the project and senior officials of the bank concerned. The government has taken no action about these matters. This is not the first time that non-violent protests against the Icha dam has been met with repression and intimidation. On April 4, 1982, Ganga Ram Kalundia, an activist of Icha Kharkai Bandh Sangarsh Samiti was killed by the police when he organised people against the unjust eviction. We strongly condemn

the arrest of activists and other tribal protesters and demand their immediate release. We also demand that the State government and project authorities halt the construction of dam until a proper rehabilitation plan for the displaced population is formulated and implemented; a complete review of the project from the social, economic and environmental angles is carried out; the displaced people are given access to information about the dam, displacement and rehabilitation; strict legal and administrative actions are taken against the corrupt project officials, bank staff and contractors; and project authorities enter into a dialogue with the displaced people and the organisations representing them and stop the use of force by the police.

Kavaljit Singh, Anil Singh, Shankar Sundi, Ghanshyam, Arvind Kumar, Ranjan Pait and Vashudha Joshi, Anil Prakash, J John, Avadesh Kumar, Arjun Kumar and Balram
New Delhi.

Left Front and Left Intellectuals

ON the eve of the polls, a large number of writers, artists, lawyers and other professionals of West Bengal issued an appeal to the people to vote for the Left Front—Rastriya Morcha alliance. The appeal, circulated by the Ganatantrik Lehak Silpi Kalakushali Sangha, a CPC(M)-led organisation, was important not because its support for the Left Front was unconditional. The appeal contained no reference to the implementation of the report of the Mandal Commission, nor to the demand for more power to the States. Instead it emphasised the inability of the State government to perform certain obligations to the people without the

Centre.

Clearly these intellectuals and professionals are not in favour of a federal structure, but only want a Centre more benevolent and more merciful to West Bengal. Ironically, the appeal contains an axiomatic reference to the 'decentralisation' of power to the grassroots through the Panchayats, supposedly an important success of the Left Front government. It seems that the signatories are trying to confuse centralisation with decentralisation. The Panchayats have linked the people with the bureaucracy and the power of the latter remains the same. Fourteen years of Left Front government has revealed this beyond any doubt. To refer to it as 'decentralisation' is sheer make-believe.

Finally, the signatories remind the people of the seventies. It is well enough to point out the horrors of those hoodlum years, but the record of the signatories themselves is hardly credible. In the appeal, they have mentioned their occupational and social identities. Among 'educationist', the first name is B D Nagchoudhury. One recalls well his role as the vice chancellor of the Jawaharlal Nehru University during the Emergency. The list also includes a number of personalities, well known and not so well known, who wooed Indira Gandhi or Siddhartha Ray during the seventies for power and help. Now they have become champions of 'leftism' under the umbrella of the Left Front government of West Bengal. Others who are not as infamous have joined perhaps because of the fear psychosis that has seemingly stupefied them. There are honourable exceptions among intellectuals who by keeping away from this show of progressiveness, have proved themselves wiser.

US\$ 50 (Surface Mail)

Special discount for back volumes 1 to 4. Just Rs 125/- for each volumes.

After Rajiv Gandhi

THE impression is unmistakable that the political establishment in the country perceives the crisis following the assassination of Rajiv Gandhi to be even more serious than that caused by the death, in similar tragic circumstances, of his mother a little less than seven years ago. If reports, widely publicised in the press, are to be believed, President R Venkataraman himself has considered it necessary to broach with prominent leaders representing different shades of the political spectrum the advisability of forming a national government, putting off the general election already under way and even bringing into being a constituent assembly to rewrite the Constitution and refashion the political system. The all-too-evident signs of panic in high political and government circles have to be explained not so much by the stature of the assassinated leader even as perceived in these circles—after all Rajiv Gandhi's entire political career spanned a bare decade and he was prime minister for just one term—but by the vastly enhanced fragility of the country's political institutions, among them very prominently the Congress Party.

It is sad to reflect that, for all the hyperbole now being lavished on him, it is not easy to identify many contributions by Rajiv Gandhi to arresting this degeneration. Quite the contrary, in fact. Prospects of any democratisation of the Congress Party under his leadership were dashed very early on; instead the drive for total personal control over the party, which so marked his mother's reign, was carried to further extremes, requiring the apportionment of all positions of influence exclusively among hangers-on and courtiers. So much so, to mention just one of the more striking consequences, the Union cabinet came over the years to comprise fewer and fewer members who commanded enough popular support even to get themselves elected to parliament. In the States, Congress Party chief ministers had to be shuffled and reshuffled with unfailing regularity and rival factions encouraged deliberately. The style of party management inevitably spilled over into the functioning of the government, with the tendency to use the different parts of the state machinery—most visibly, the official information media—to advance the cult of the sole leader getting progressively more unabashed. The result, altogether predictably, has been corruption, arbitrariness and total lack of accountability. In a political environment surcharged with tension and violence and with both the inclination and the means to commit mayhem widely dispersed, there could scarcely have been a more reliable recipe for what came to pass at Sriperumbudur on Tuesday night.

With the, quite admirable, rejection by Sonia Gandhi of the attempt of the scheming hangers-on to use her to protect their pelf and power by getting the Congress Working Committee to unanimously nominate her as the party president, the possibility has been opened up of the Congress at last

emerging from the spell of the Nehru-Gandhi dynasty. This has let loose a flood of suggestions for realignment of political forces in the country—of all Congressmen, present and one-time, coming together, of all centrist forces teaming up, of all secular elements joining hands to thwart the BJP-VHP combine, of the Left parties coming closer to the Congress, and so on. While a measure of rearrangement of the political pieces is implicit in the logic of the emergence of a post-Nehru-Gandhi Congress, it can hardly be lost sight of that there is a very real danger of the dominant classes and interests, which have their fingers in different political parties and groups, trying to use the so-called political realignment to drum up renewed legitimacy for policies and programmes whose unsavoury consequences as far as the mass of the people are concerned have become pretty well exposed.

Without in any way playing down the danger posed by the strengthened communal forces, the harm done to the country and the people by the policies pursued by the Congress governments in the eighties, which the short-lived National Front and SJD governments did little to reverse, has to be squarely faced. The country today finds itself on the brink of external bankruptcy and loss of economic sovereignty. There has been a marked widening of economic disparities, growth of unemployment, strengthening of inflationary pressures with its consequences for the living standards of the vast majority of the people, festering social inequities and aggravation of ethnic and regional discontent and alienation. These developments have after all played not a small role in creating the climate for the rise of Hindu communalism of the BJP and VHP variety. So any coming together of parties and groups, if it is to mean anything at all, must be based on a commitment to a programme to arrest and reverse these tendencies. But there are, one suspects, those who are championing a realignment of political forces for precisely the opposite reason—to win a fresh lease of life for the Congress's discredited policies. Consider, for example, the enthusiasm that is noticeable in the most unexpected circles for a coming together of the Left and the Congress; these circles are even prepared to accept the idea of the prime ministership under such an arrangement going to Jyoti Basu of the CPI(M). Partly this may well be a tribute to Jyoti Basu's undoubted political stature, but, considering some of the quarters from which these proposals are being mooted, can the calculation be altogether absent that a government with a Leftist veneer will stand a better chance of winning some measure of popular acceptance of the policies which are being pressed upon the country by the IMF and the World Bank as a precondition for the resumption of the flow of external funds to underwrite the continuance of the so-called economic liberalisation?

Survival Strategies

THE shock and sorrow that the people might have felt at Rajiv Gandhi's tragic end were allowed to dissipate within less than 24 hours into a ludicrous anti-climax by his colleagues in the Congress Working Committee when in a desperate search for his successor as the party president, they fell back on Sonia Gandhi. The unseemly haste in which Congress(I) veterans with years of political experience behind them chose to elect as their leader someone who is not even a debutante in Indian politics leaves us with the only surmise that is possible in such circumstances—a bankrupt leadership is trying to clutch at anything that might provide it with a tenuous link with the Nehru dynasty.

As important as the long-term strategy for survival is the Congress(I)'s immediate need to win the elections in the second and third phases of polling. Here again, the party's leaders and cadres have shown the least qualm in making use of the assassination, even before the dead leader's mortal remains could be consigned to the flames, for projecting the Congress(I) in larger-than-life colours to impress the electorate. The distinction between the protocol reserved for the funeral of the head of the state and that for the leader of a national political party was sought to be blurred at every stage to reinforce in the public mind the impression that even out of power, a Congress(I) ex-prime minister—and a scion of the Nehru family at that—could still command all the official honours. The official 'bandobast' can of course be justified on the ground that certain privileges are due to an ex-prime minister. But then, was such a grand 'bandobast' organised by the government when another ex-prime minister, Charan Singh, died a few years ago? What is important to note is the government publicity given to the funeral of the leader of a political party which was elevated to an official function, on the eve of an election where that party can make the most of such publicity in its election campaign. By conceding to the Congress(I) pressures for organising a ceremonial display with all the paraphernalia associated with the funeral of the head of the state who dies in harness, was the present prime minister merely showing respect to an ex-prime minister or plotting a new move in his own political game? Developments in the next few days may provide the answer.

Meanwhile, the publicity offered by the official media and gained through the state funeral of its leader is quite likely to boost the Congress(I) efforts to whip up the 'sympathy wave' on the crest of which it hopes to come back to power. But there is an ominous dimension to such efforts to create a 'sympathy wave'. At the local level, the Congress(I) leaders and their

causes do not appear to be content with a spontaneous wave. Soon after the news of the assassination was flashed by the media, Congress(I) hoodlums came out on the streets. But unlike 1984 (following Indira Gandhi's killing) when they had a particular target in the Sikh community, this time the objects of their fury seemed to be diffused at the beginning. On the night of May 21, in front of Rajiv Gandhi's residence at 10 Janpath, they hurled abuses indiscriminately against policemen, press reporters and photographers, and even attacked the car of President Venkataraman when he came to visit the residence. But soon their fury was cleverly steered by their leaders in the direction of the non-Congress(I) parties. Offices and residences of politicians of the DMK in Tamil Nadu, Telugu Desam in Andhra Pradesh, Janata Dal in north India and the CPI(M) in West Bengal began to be selectively attacked. One could discern a deliberate attempt to silence the anti-Congress(I) parties and their workers as a preparatory step in the next stage of electioneering.

MUTUAL FUNDS Hopes Belied

MUCH store was being set on the collections by the various mutual fund schemes which some of the major nationalised banks and some financial institutions have been allowed to float. The major assumption underlying this optimism was that people would be attracted to subscribe substantially to these schemes, given the tax concessions which subscriptions made under these schemes are eligible for.

Under Section 80CCB, any subscription under these schemes is deductible fully for arriving at taxable income subject to a separate ceiling of Rs 10,000. This meant that such subscription was not to be counted against the ceiling of Rs 40,000 under Section 80CCA for deposits made under the National Savings Scheme. Although both 80CCA and 80CCB contributions are fully deductible subject to the respective ceiling, the latter's additional advantage is that to the extent returns thereon accrue in the form of capital gains and not interest—since the mutual fund schemes are supposed to be equity-linked saving schemes—it also enjoyed exemption allowed to capital gains up to Rs 10,000.

Given the edge 80CCB contributions have over those under 80CCA, it was believed that collections under the various schemes entitled to the benefits of this tax concession would be substantial. The estimates of collections for 1990-91 ranged from Rs 1,000 to Rs 2,000 crore. However, it turns out now that the actual collections under the mutual fund schemes did not exceed Rs 700 crore in

1990-91. Obviously, the optimism originally expressed when the various schemes were launched has been sadly belied.

Whether or not the government persists with this tax concession and allows more schemes to be floated, a point that has not received sufficient attention in this context is that collections under these schemes do not accrue to the Central Budget, they are not shareable with the States on the lines of the small saving collections, which incidentally include deposits under 80CCA. This aspect becomes noteworthy because under the interim Central Budget for 1991-92, it has been proposed to mobilise as much as Rs 2,500 crore by way of disinvestment of government equity in selected public sector undertakings "in favour of mutual funds and financial or investment institutions in the public sector". Clearly, to the extent that mutual funds contribute to the funding of the proposed disinvestment of government equity, the Central Budget would be availing itself fully of the 80CCB contributions and the States would be kept totally out of the picture. Is that fair?

NUCLEAR INDUSTRY Desperate Measure

THE Atomic Energy Commission's latest proposal to accept spent nuclear fuel from foreign countries for reprocessing here appears to be a somewhat hare-brained scheme. Its objective apparently is to earn foreign exchange and it is part of the Indian atomic energy establishment's bid to export its much touted 'indigenously developed' capabilities in the field. First, just how many takers will there be for such an offer? And second, have the safety and security features been given sufficient thought?

According to the International Atomic Energy Agency (IAEA), there are some 325 research reactors in operation almost all of which produce wastes. As of 1989, nine countries were operating or building reprocessing facilities for spent fuel and 11 were sending or were planning to send their spent fuel for reprocessing abroad. Countries in Europe or in South America are unlikely to be shipping hazardous wastes to India, even if, as the AEC chairman claims, reprocessing is a "manpower intensive" operation which "can be done more inexpensively in developing countries"; there are too many other problems to cope with. For one thing, there are the stringent IAEA guidelines to be followed for the transport of such material and for another there are the other safeguards covering materials like plutonium. This means that only countries in Asia or Africa are likely to make use of these facilities. There were (as of 1989) only 24 research reactors in south and west Asia

China. The AEC chairman has also stated that India will accept spent fuel only from research reactors and that too only from those countries which will accept the wastes as well as the plutonium. Given all this, how many countries will be able to take advantage of the offer?

There is also the question of environmental safety. What this operation would involve is the spent fuel which consists of plutonium and other radioactive by-products being transported to India, the plutonium being separated from the wastes and the two being transported back again to the country of origin. Quite apart from the risk of plutonium theft, there are the risks that such transport on a regular basis poses. Only recently a traffic pile up in a European country, involving a truck carrying radioactive wastes, would have resulted in a major tragedy had emergency measures not been undertaken. Not that there is not such hazardous material on Indian roads already. According to a recent report 25,000 radioactive packages were shipped throughout the country in 1990. More significantly, there has been the bulk transport of spent fuel from the various reactors in the country to either the Trombay plant or the one at Tarapur and the movement of radioactive wastes to their designated resting places. Obviously the AEC will have to make extraordinary arrangements for the safe handling and transport of such material both within the country and overseas quite apart from the fact that it will have to be accountable to the IAEA for the high risk plutonium which it will separate from the wastes even if it is to be sent back to the country of origin.

Why should the AEC go to such lengths to earn negligible amounts of foreign exchange? It would appear that these plans have emerged out of a need to cover up past mistakes in planning. Clearly the AEC has now on its hands far too much idle capacity for reprocessing—with the third reprocessing plant at Kalpakkam nearing completion—which needs to be made use of. Hence this desperate scheme?

LEATHER EXPORTS

Large Potential

THE leather and leather goods industry has achieved impressive growth in exports in the Seventh Plan. In fact the export growth of the industry has been more impressive than the growth in its production. While the value of production increased from a base level of Rs 1,670 crore in 1984-85 to Rs 4,000 crore in 1989-90, export earnings rose from Rs 662 crore to Rs 2,030 crore over the same period. Thus

cent of its estimated production in 1984-85, it exported over 50 per cent of its production in 1989-90. Thus the leather industry has emerged as a thrust sector for exports. More importantly, unlike many exporting industries which depend on large-scale imports, the import component of leather goods exports is only about 15 per cent.

Rapid growth in leather exports was facilitated by liberalisation of import and industrial licensing policies, simplification of procedures and rationalisation of export incentives. The decision to discourage exports of semi-finished and finished leather and the accent on exports of value added leather products also paid rich dividends. The result of the fruitful interaction between the government and industry is not just the rise in export earnings but also a significant change in the export product-mix. The share of leather products in the total leather exports is now 65 per cent as against 40 per cent five years ago and this share is expected to increase substantially in the Eighth Plan. Equally significant is the fact that the general currency area now accounts for as much as 78 per cent of leather exports and only 22 per cent go to rupee currency areas.

The export target for 1990-91 was fixed at Rs 2,700 crore, which has been achieved according to provisional figures. But for the Gulf crisis, the target would have been surpassed. Going by the trend so far, the Eighth Plan export target of Rs 3,400 crore is expected to be achieved in 1991-92 itself. The Indian Leather Products Association (ILPA) is formulating a plan to increase India's share in the world leather products trade from the present level of 3 per cent to at least 5 per cent by 1994-95. The world leather trade is expected to increase from the current level of \$ 35 billion to \$ 50 billion by 1994-95. Thus the ILPA aims at stepping up India's leather and leather products exports to \$ 2.5 billion (Rs 6,000 crore) by 1994-95.

According to the Council for Leather Exports, it is possible to raise the country's leather exports to a level of Rs 10,000 crore by the year 2000. However, proper planning and policy measures would be required to achieve this ambitious target. Special efforts would be required to promote exports of high value items such as footwear and leather garments.

Footwear account for more than 50 per cent of the global imports of leather products. India exported footwear worth Rs 171.43 crore and footwear components worth Rs 518.45 crore in 1989-90. By 1994-95, it is proposed to increase exports of footwear from the current level of 16 million pairs to 45 million pairs. The

by 1994-95 from 40 million pairs in 1989-90. The leather garment segment of the industry has achieved a spectacular growth in exports. Its export earnings in 1989-90 amounted to Rs 332.88 crore, an increase of 100 per cent over the previous year's level of Rs 166.15 crore. The earnings of this segment are expected to reach a level of Rs 750 crore by 1994-95.

A major constraint in achieving the projected export targets is the growing shortage of hides and skins. According to official sources, the total requirement of leather by 1995 is estimated at 1,500 million square feet for the domestic and export markets for leather products. The demand-supply gap by then is expected to be roughly 200 million sq ft. This gap can be reduced to some extent through improved recovery of hides and skins. According to one estimate, the country loses about Rs 500 crore per annum due to non-recovery of hides and skins.

Apart from improving the recovery of hides and skins, it may be necessary to import some quantities of leather to meet the requirements of exporters of leather products. At the same time efforts must be intensified to phase out exports of finished leather to ensure that by the end of the current decade the country exports only value added leather goods.

Some other areas which need attention are lack of modernisation of tanning units, need to upgrade the quality of hides and skins by application of PU films and PU chemicals and augmenting supplies of leather chemicals and other raw materials through imports and domestic sources. Since units in the small-scale and cottage sector account for 85 per cent of the total production, they need help from government agencies and financial institutions.

YUGOSLAVIA

Balkan Crisis

WITH the ruling Serbian communists scarcely in a mood to dilute their obdurate chauvinism, that by and large provoked the electorates of four of the six Yugoslav republics to bring non-communists governments to power, a Balkan crisis of a kind has erupted yet again. Since the new governments in Croatia, Slovenia, Bosnia-Herzegovina and Macedonia themselves represented ethnic assertion against Serbian domination, the developments since last year's election seem in retrospect to have been proceeding ineluctably towards confrontation between the four rebel republics and Serbia and its satellites. The latest crisis is clearly an outcome of this accentuating conflict reaching the higher federal institutions and is for that reason perhaps the more serious, par-

not active complicity, is evident in Serbia's move to depart from the formal arrangement relating to presidency. The Croatian State Presidency representative Stipe Mesic's elevation to presidency following the expiry of the term of the Serbian representative Borislav Jovic has been obstructed. The eight-member State Presidency, representing each of the six republics of Serbia, Croatia, Slovenia, Bosnia-Herzegovina, Macedonia and Montenegro and the two provinces currently under Serbian control, Kosovo and Vojvodina, has a system of rotating presidency with each representative holding office for one year at a time. The system was devised by marshal Tito to prevent precisely the kind of ethnic problems now being faced.

The reason for the startling Serbian move lies not merely in the historical Serbo-Croat rivalry, but perhaps to a greater degree in the post-election tendency among the four rebel republics to demand a far looser confederation than currently obtains. In December last Slovenia, the most prosperous of the republics, producing 25 per cent of the country's GNP and with a 90 per cent Slovenian Catholic population, declared its intention, through a plebiscite, to secede. Slovenian president Milan Kucan has threatened to implement this decision by June 26. Likewise Croatia, the second largest republic with 75 per cent Croatian Catholic and 12 per cent Serb Orthodox population, has under the Right-wing nationalist presidency of Franjo Tudjman organised a referendum and opted out of the federation in order to create a far looser confederal system. Similarly, Bosnia-Herzegovina, with 43 per cent Muslim Slavs and 18 per cent Croats, and Macedonia, with 68 per cent Orthodox Macedonians and 25 per cent ethnic Albanians, though yet to hold referendums, have, fearing Serbian designs for 'Greater Serbia', followed more or less the Croat-Slovenian tendency towards greater autonomy.

The army's interest in the affair is not surprising either. With a 70 per cent Serbian officer corps the army has an interest in perpetuating Serbian domination. It had threatened to act independently after the State Presidency vetoed its demands for sweeping powers to combat ethnic violence and for imposition of martial law in Croatia and following the republics' refusal to heed its call for the disbandment of private anti-Serb militias. The State Presidency is the joint C-in-C of the army which would have been far from comfortable with a Croatian president. The obstruction of Stipe Mesic's presidency followed soon after the army

issued its ultimatum and the vote in the State Presidency followed existing divisions. The four non-communist republics voted in favour of his candidature while Serbia and the provinces of Kosovo and Vojvodina opposed it. Serbian satellite republic Montenegro abstained. A five-three majority is the minimum requirement in the State Presidency.

This move has evoked a sharp response from both prime minister Ante Markovic and foreign minister Budimir Loncar while the four republics have withheld their contribution to federal funds in violation of federal laws and added threats of total independence.

What raises fears of army intervention is not only the delicate state of inter-ethnic relations but the equally peculiar territorial distribution of ethnic groups. Croatia has a significant Serbian presence. In eastern and southern Croatia Serbs dominate to the extent of being 80 per cent of the population while places like Knin have formed anti-Croat Serb militias. Bosnia-Herzegovina has 31 per cent Serbs with cities like Banja Luka and Trebinje being fully Serb dominated. The anti-Serb feeling in these two republics has led to a kind of loose alliance between Muslim Slavs and Croat Catholics. Additionally Serbian controlled Kosovo has a 90 per cent Albanian population which could well link up with ethnic Albanians in Macedonia.

Serbian communist leader Slobodan Milosevic's popularity in his republic has much to do with his cultivation of Serbian chauvinism, using the plank of 'Greater Serbia'. This has also meant that Serbia has been providing aid to Serbs in the other republics. For instance, Serb militants in Croatia have already formed their own state in Krajina and merged it with Serbia. It is clear that non-resident Serbs have given up all pretence of any larger Yugoslav identity. And the army using the excuse of harassment of the Serb minority has begun to make intemperate noises about 'Croatian fascism'.

What has got the republics on the defensive has been the singular absence of Western enthusiasm for their project, if the Slovenian experience is anything to go by. Slovenian foreign minister Dmitri Rupel seeking international recognition for independent Slovenia admits that only two countries—believed to be Austria and Greece—have guaranteed recognition, while both the European Community and the US have actively discouraged Slovenian independence. In the light of this and fearing army invasion, Slovenia has sought to buy its freedom having already paid Serbia generous sums of money and offered to meet 25 per cent of Yugoslavia's debts. But even this has been of no avail.

TWENTY YEARS AGO

EPW, May 22, 1971

One of the many sweeping conclusions hastily accepted after the last Lok Sabha elections was that the results of the poll reflected the political demise of essentially regional parties. The fate of the Akali Dal in Punjab, the BKD in UP, the Bangla Congress in Bengal and so on was held up in support of this assertion. To that extent the elections were supposed to have reversed the trends towards fragmentation of political loyalties and support revealed by the 1967 general elections. There is, however, room for argument that what happened in 1967 was perhaps more typical of what may be expected of the political system in future and that it was this year's election results which were in the nature of a freak. In any case, there is little ground for reading into them a defeat for the regional parties specially; all parties, whether national or regional, with the possible exception of the CPI(M) in West Bengal, crumpled before the onslaught of the Congress(R). Indeed it can as well be argued that the elections exposed the essentially regional character and support-base of supposedly all-India parties like the CPI(M) or Jan Sangh.

It remains to be seen whether the apparent coherence and stability imparted to the political system by the massive success of the Congress(R) in the last elections is something more than a nine-days' wonder. But the circumstances in which the elections were fought were special enough to preclude any long-term conclusions being drawn about how far the cultural, linguistic, economic and other differences within our plural society, which had till the other day seemed to so strongly influence the political system, have been altered. It still seems a plausible hypothesis that the Congress(R) is likely to be most effectively challenged by local or regional parties; and if it is so challenged successfully in one State after another, its own all-India character and image, which shine so bright today, are bound to suffer.

* * *

In sharp contrast to the hysteria which has convulsed our elitist 'intelligentsia' over Bangladesh, there has been almost a deafening silence over the killings, mostly of young revolutionaries, in another neighbouring country—Ceylon. Those reactions that there have been are invariably sympathetic to the 'dilemmas' of the United Front government of Ceylon. Our government's reaction was indecently hasty. No sooner had Sirimavo Bandaranaike asked for military aid and armed personnel, than did Indira Gandhi oblige. In fact, some reports from Ceylon claim that if Indian Air Force planes had not landed with our old stocks of ammunition for the 303 rifles and Bren guns of the Ceylonese army, it is quite possible that the widespread and spirited attacks of the Janata Vimukti Peramuna, during the first few days after the beginning of the insurrection on April 5, would have overwhelmed the forces of the establishment.

Poetry Changes Nothing

GPD

What appears at first sight to be an ordinary patriotic poem published in the overseas edition of the People's Daily may end up creating something of a media storm in China

SUB EDITORS and assistant editors are in for hard times in (what was once People's Republic of) China. When it was being ruled by Stalinists and Maoists it all made sense perhaps. Who does not know the repressive methods and the constantly invigilating eye of those communists? Now that all of them are gone and forgotten you must wonder why the editors and sub editors face any difficulty in (Deng's Republic of) China. Well, they are about to. The overseas edition of the *People's Daily* carried a poem which it should not have, at least from the point of view of job-security of a sub editor or two. Maybe our human rights enthusiasts could be put on the job of monitoring the future and, of course, the past of the editorial staff of the *People's Daily*. Since the edition involved is the overseas edition, they can legitimately do so.

The two reference to the overseas edition (with due apologies to our human rights enthusiasts) are made on purpose. This is with a view to dispelling the impression that the controversial poem has been circulated within China. It has not been. Eventually via Hong Kong and coastal China it will reach there. But in all probability this has not happened yet.

Not only was the poem carried in the overseas edition, the author also happens to be studying in the US. If the American government was as sensitive to the rights of the Chinese as it was to those of the Kuwaitis after it was invaded by Saddam's Iraq, it might well allow the Chinese poet to settle down in the US. He might make an ideal teacher of poetry and politics. Anyway, it must be made clear what kind of game he played with the editorial staff of the *People's Daily*. All and sundry will play games with you if you are outdated. After all, this newspaper must be the only institution in China which still carries the qualifier 'peoples'. That is, six years after Gorbachev became the (doubtful) boss of the Soviet Union and exhorted everyone that "we are in the same boat and should row in the same direction". Obviously the staff at the *People's Daily* do not think so. But then they have landed themselves

in an impossible situation.

Anyway, to return to the poem. It is printed in the traditional Chinese style. Vertically and from right to left. It makes a nice little square. Seven vertical lines and eight characters in each line. In translation the poem reads:

The East Wind stroking the face
prompts the growth of peaches
and plums,
A strong eagle spreads its wings to soar
to great heights
A bright moon shines on the sea, and
I shed my passionate tears,
Far away from home, I ascend a height
to think of my native land
I am determined to dedicate myself to
the service of my country,
People nourishing me weigh heavier than
10,000 taels of gold
I rise bravely and dash ahead to
revitalise the country,
Wait the Divine Land for spring is
everywhere

It is easy to see that it is a typical example of a patriotic poem. It could have been written in any country and in any language. During the days of the nationalist movement any number of such poems were written. Savarkar in fact used the very words 'passionate tears' in one of his poems. We are told that any number of 'new' historians are increasingly questioning the 'nationalist' character of our nationalist movement. But they probably do not question the fact that any number of poems, plays and pieces of fiction and essays were written during those years. So what is so great about this poem? And why should it create a storm in the 'international' and, therefore, in the Chinese newspaper world?

That it has created a storm in the

Chinese policy-makers' world is clear enough. The reason for it is two-fold. Zhu Haihong (the poet) played a nice little game with the editorial establishment of the *People's Daily*. The game becomes clear if you started reading from left-hand top diagonally to right hand bottom, from line 1 on the right to the line 7 on the left. If you read the relevant characters they are *Li Peng Xia Ping Min Fen*. In translation they mean "Li Peng must be removed from power to assuage popular indignation".

In short, this is a modern version of 'bombard the headquarters', except that it emanates from the safe haven of the American paradise and Beijing is no Baghdad for Bush and his men to discipline. This is not because the rulers in Beijing are (or are not) socialist, but rather because China is much too big for the Americans to intervene directly. There are certain advantages in bigness. All our secessionists do not realise that they would be turning their people into cannon-fodder for the Americans if they actually succeeded in carving out small little states for themselves. So there would be some media storm over the Chinese poem, but it would lead to practically nothing else.

The poem was appropriately entitled as Yuan Xiao ('The Sweet Dumplings'). These dumplings are made at the time of the lantern festival which usually announces the arrival of spring—like Baisakhi in North India and Chaitra Pratipada to the south of the Vindhyas. In short, the poem will be a tearful memory of the motherland and of those who, whatever their number, were killed in the Tiananmen Square in June 1989. A sub-editor or two will lose their jobs. But that's about all. Poetry changes nothing. Nor does the tearful memory of the motherland. And certainly long-distance strategies of political change are even more futile. Gone are the days of Lenin when writing in exile was and could become such a force. Changing the world is out of fashion now. As we said above, Zhu Haihong can look forward to a job in an American University and continue writing his diagonal poetry—but that's about all.

Incoherent Privatisation, Indian Style

D N Ghosh

Privatisation does not necessarily mean reduction in the role of the state; it requires a more effective state, with the political will to create conditions for industrial efficiency, productivity and technological advance. Any policy thrust that has as its sole objective the reduction of the fiscal deficit will, sooner than we expect, result in serious market failures.

I

IN defence of a sweeping privatisation law, Czechoslovakia's finance minister, Vaclav Klaus, whom some economic journalists describe as his country's Milton Friedman, asserts, "Those who reject privatisation and seek a Third Way between the market and socialism, should realise it leads to the Third World".¹ Somewhat uncharitable, perhaps, to have dragged in the Third World to score a debating point, but to win political acceptance for a highly emotive and sensitive issue as privatisation is an unenviable task for any finance minister.

What our finance minister has sought to do is to strike a middle path between the public and private sectors; 20 per cent of government equity in selected public sector undertakings would be divested in favour of mutual funds and financial or investment institutions in the public sector. The measure would yield Rs 2,500 crore to the exchequer in 1991-92, but, equally importantly, the finance minister expects that this broadbasing of equity through the proposed disinvestment would improve the management of the public enterprises. The expectation is based on questionable premises.

The first set of implicit premises. It has been taken for granted that divesting of equity in the manner proposed would bring about a qualitative change in the management of the concerned public enterprise. There is an intrinsic nexus between the objective of an enterprise and the managerial efficiency of that enterprise in harnessing its resources for the achievement of that objective. Management efficiency in the same enterprise over a period of time or comparative efficiency of managements in different enterprises would lend itself to easy evaluation, if the objective were set clearly in terms of market costs and profitability. If a public enterprise has multiple objectives (such as employment maintenance, regional development and income distribution) and con-

tinues to be one of the instruments of the state for reaching these objectives, appraisal of managements between two time periods or between the public and private sectors becomes an extremely complex and baffling exercise, beset with a host of methodological issues. With multiple objectives where the focus is lost, both public and private enterprises suffer from the same limitations. It does not seem that the multiple objective character of a public enterprise is proposed to be altered; and if not, mere infusion of private shareholding in public enterprises would not bring about any improvement in management if such improvement is to be judged against the performance of a similar private sector enterprise with clearly defined market objectives.

The second set of fallacies arises from the axiomatic belief that private sector managers, given their incentives and autonomy, exhibit performance better than their public sector counterparts. This is a popular belief, not without logic or rationale, but certainly not of universal applicability.

Evidence of the connection between ownership and efficiency is mixed.² Ownership is not always a distinguishing reason for the difference in performance. It is not ownership but inter-connection between ownership and competition that promotes efficiency. Under competition, private firms are likely to do better, but if there is little competition, regulated private firms do not perform better than public firms and may do worse. The incentive to productive efficiency comes from the pressure on private firms to achieve better to stay in business, in competitive product markets to avert the threat of take-over of corporate control from the market. If, however, there is little competition in the product market, if the risk of bankruptcy is slight and if the risk of take-over is also minimal, the pressures of the market affect the private sector manager no more than his public sector

counterpart. Available evidence also does support the view that efficiency of firms, public as much as private, is improved by a competitive environment.

In the case of sectors where competitive conditions do not exist and are difficult to generate and sustain, change in ownership would not necessarily lead to efficiency in terms of costs and profitability. Given the structure of an industry and the technological compulsion to operate on a certain minimum scale too large to allow the existence of a number of other competing units, it may be unavoidable, as a measure of public policy, to regulate the operation of these enterprises in such monopoly or quasi-monopoly situations. The regulatory authority will have to fix prices on the basis of normative standards and function as a proxy for market pressure. Efficiency in this type of industries is a function of the market structure rather than ownership. The market structure in many developing countries allows private enterprises to flourish without due regard for costs and profitability; this is unlike the situation in many of the developed countries where norms established by the regulatory bodies act as severe deterrents. Assuming that the finance minister had in mind some selected public enterprises with the objectives set in terms of costs and profitability, it cannot be laid down without reservation that privatisation would necessarily lead to productive and allocative efficiency.

The third set of fallacies. Look closely at the new hybrid corporate creature that the finance minister proposes to create with part of the divested equity. The scheme envisages divestiture of shares to mutual funds and investment and financial institutions in the public sector. A purely revenue-raising measure, it will be far-fetched to call it a move towards privatisation. Clearly, this would be construed as a direct interference with the autonomy of the mutual funds in the making of their investment decisions for maximising returns to investors. Their manoeuvrability in the management of funds entrusted by the investors will be affected adversely not by market forces but by other considerations. Assuming ultimate divestiture at a later stage to the public at large, we would have a new class of corporate creatures where 80 per cent of equity will be with the government and the remaining 20 per cent with the public.

Would this make any difference to the current behavioural pattern of public enterprises? It does not look possible. The public sector character of the enterprises will continue to remain as it is, since only

a minority part of the government holding is being diluted. The control and regulatory parameters may remain as they are; and if so, the divestiture will not make any difference to the management style of the public enterprises. It would purely be a measure towards reduction of the fiscal deficit and with hardly any impact on what is being conceived of as the efficiency fall-out of the privatisation move.

Visualise another scenario. In the event of the holdings of mutual funds being off-loaded to the public at large, is that likely to make a difference to the enterprises? The tradition in India is that the minority shareholders in the private sector manage the company even though the majority of the equity may be with the financial institutions. In the Indian corporate scenario, we live happily with the concept of a private group owning a minority share and controlling the company as the owner-manager. Any attempt to rationalise this is interpreted as a grave interference with the rights of the particular group of shareholders, even though they happen to be in a minority. Can it therefore be ruled out that, despite certain statutory safeguards, a determined controlling group acquires control over some of these public enterprises and uses it in a manner which is detrimental to the ultimate interests of the company or the shareholders? In the context of the present relationship between business and politics, taking the state out in certain sectors, even marginally, would open up golden opportunities for certain classes of the private sector to bring in the state in another way for guaranteeing benefits which otherwise would not accrue to them in a competitive situation.

The finance minister's statement raises more questions than it answers. We have raised these not to argue against privatisation as such, but to search for clarity. The finance minister has, quite understandably, the task of absorbing the shock of abandoning the holy cow and at the same time sending the distress signal to IMF. In this clever political game of obfuscation, he seems to have perhaps succeeded.

II

The finance minister's bald statement while presenting the budget does not provide us with a guide map for privatisation. We have raised a trail of unanswered questions above and we now need to understand in this context the principles and problems or priorities for evaluating any policy initiatives towards privatisation.

Privatisation did not emerge as an ideology as socialism did. It may be viewed as a pragmatic reaction to the perceived inefficiencies of most public enterprises. The sources of inefficiency

NOTICE

It is hereby notified for the information of the public that The Mafatlal Fine Spg. & Mfg. Co. Ltd., proposes to give to the Central Government in the Department of Company Affairs, New Delhi, a notice under sub-section (1) of section 21 of the Monopolies and Restrictive Trade Practices Act, 1969, for substantial expansion of their undertaking. Brief particulars of the proposal are as under:

1. Name and address of the owner of the undertaking:

The Mafatlal Fine Spg. & Mfg. Co. Ltd.
Mafatlal Centre, 7th Floor,
Nariman Point,
Bombay-400 021.

2. Capital structure of the owner organisation as on 31.3.91:

| Particulars | Rs. in lacs. |
|-------------|--------------|
| Authorised | 3,000.00 |
| Subscribed | 1,447.44 |

3. Location of the unit or division to be expanded.

The Mafatlal Fine Spg. & Mfg. Co. Ltd.
Unit No. 2, Rambhau Bhogale Marg,
Bombay-400 010

4. In case the expansion relates to the production, storage, supply, distribution, marketing or control of goods/articles, indicate.

- (i) Names of goods
- (ii) Licensed Capacity/turnover before expansion
- (iii) Expansion proposed

Not applicable. The proposal is for import/installation of 8 Nos. Open End Spinning Machines consisting of 192 rotors each in replacement of existing 1536 Ring Spindles in terms of Press Note No. 26 dt. 12.10.1989 issued by the Ministry of Industry, New Delhi, permitting the replacement of Spindles by Open End Rotors in the ratio of 1:1.

5. In case the expansion relates to the provision of any service, state the extent of expansion in terms of usual measures such as value, turnover, income etc.

Not Applicable

6. Cost of the project.

Rs. 7,50,32,320/-

7. Scheme of finance, indicating the amounts to be raised from each source.

| | |
|------------------------|-------------------|
| Internal Accruals | Rs. 18,20,000/- |
| Financial Institutions | Rs. 7,32,12,320/- |

Any person interested in the matter may make a representation in quadruplicate to the Secretary, Department of Company Affairs, Government of India, Shastri Bhavan, New Delhi, within 14 days from the date of publication of this notice, intimating his views on the proposal and indicating the nature of his interest therein.

Dated this 24th day of May, 1991.

For THE MAFATLAL FINE SPG. & MFG. CO. LTD.

(E.V.S. CHAKRAVARTHY)
SECRETARY

arise from decision-making processes based on political expediency rather than on commercial logic, on investment decisions dominated by Treasury compulsions and inherent conflicts of interests with government both owning and controlling an industry.

In their privatisation efforts, different countries have given priority to different objectives: improving economic performance of the unit concerned, resolving the persistent problem of management and control relationships between government and industry, raising of resources for reduction of fiscal deficits, disciplining the power of public sector trade unions, promotion of a kind of popular capitalism through wider share ownerships.³ The multiple objectives may be mutually inconsistent, but this in itself cannot be construed as a criticism of the policy. By and large, any objective which seems achievable is seized upon as justification, though economic efficiency, which is the most important of these objectives, has been the most difficult to attain.

International experience is a pointer that the privatisation programme should not, to start with, be undertaken on a grand scale. Look at the UK. Its interesting experience is instructive in many ways. Privatisation did not start in that country as a well-designed policy at all. When the Conservative government was first elected in 1979, it was little more than a gut reaction born out of impatience with the shortcomings of the nationalised industries. As the programme got under way and met with an unexpectedly enthusiastic response from investors, it became, as a financial commentator put it, "a policy with almost everything going for it, as if by a process of alchemy, the dull metal of Britain's unloved public sector was being transformed into pure gold".⁴ In Chile, the 1973-74 bout of privatisation was privatisation by fiat leading to serious market failures. It was corrected in 1982-83 by a second re-privatisation programme, subsequently fine-tuned in two further sectoral privatisation programmes in the late eighties. In Eastern Europe recently privatisation has failed to gain momentum, as earlier anticipated, in the absence of property rights, competitive market conditions and lack of a scientific regulatory system and support of technology and the market. The lessons both for developed and developing countries do point to the futility for rushing ahead full-scale with a strategy of grand design without adequate preparation.

Selection of the enterprise and the specific industrial segment is the heart of any policy. Different sectors raise very different issues of economic organisation and efficiency, different aspects of public policy (like national security, regional

development, control of monopoly, etc) and a differentiation of policy responses according to the circumstances of the case. As discussed above, change in ownership cannot guarantee efficiency. What is critical is the market structure in which an industry operates and the climate of competitive pressures. It is, therefore, simplistic to press for divestiture across-the-board in all public enterprises. This is not to argue against divestiture as a mode of privatisation or to ignore its deficit-reducing impact; in fact, in the UK the move towards privatisation was spurred largely by the size of the fiscal deficit. What is important is the selection of enterprises in specific industrial and market structures where the two objectives of economic efficiency and divestiture converge.

The choice of modality. Commonly, privatisation has been associated with transfer of government-owned industries in a way which ensures that the predominant share in the ownership of assets lies with the private shareholder. The range of modality may be enlarged to cover transfer of responsibility of operating any activity to the private sector (and incidentally reducing the impact on the budget). In this wider perspective, other groups of activities readily come to mind; services which are currently provided by the government at zero or near-zero cost (financed by taxation, but which might conceivably be sold in the market with or without a public subsidies programme); an outside private sector contract brought in to replace an insider for government purchases and services and relaxation of official restrictions on entry of industry into different markets. If we are looking towards efficiency, we should be flexible in the choice of modality. In different countries, the variation of modality has been freely encouraged to realise the basic objective of economic efficiency.

In the UK, public offering has been the most conspicuous method with the government retaining special powers conferring on it special privileges in the public sector. This method was adopted in Rolls Royce, British Airways, British Petroleum, the British Gas Corporation and British Telecommunications, to name a few. Royal Ordnance was privatised through private sale in two phases: in July 1986 to Vickers to purchase the Leeds Tank Factory and the rest in April 1987 to British Aerospace. British Airways Helicopters was sold through private sale to a private consortium newspaper group comprising Robert Maxwell, *Scottish Daily Record* and *Sunday Mail*. Buy-out by employees was adopted in Leyland Bus, National Bus and National Freight Companies. There are cases of merger, notable among which was that of British Leyland with the Rover

Group. While the UK has the advantage of a very developed stock market and a financial services sector, it is not always so in other countries. Take Spain. It has a small public sector but when the public sector deficits went up sharply during the seventies from 0.3 per cent of GDP to 5.6 per cent, the government sold the assets to foreign companies, one of the major reasons being that the stock market could not have absorbed a large stock fluctuation. The experience of Chile is instructive from the Indian angle; it brings out sharply the need for screening potential buyers, care and caution needed for large-scale divestiture in a limited financial market and the risk factor of relying heavily on debt as an instrument of financing the sale of shares.⁵

A major source of controversy has been the extent of shareholding that should be divested to the public, and the extent and nature of control of management as between the representatives of private and public shareholders.⁶ In the privatisation cases which started in the UK from 1979 onwards, the majority of equity was transferred to the public, but the government retained a minority holding with considerable power of intervention through the instrumentality of what is called the 'golden clause'. The intention is to assign to the government certain special rights to approve or disallow certain actions including liquidation, take-over, issuance of certain special shares and limitation on control by any particular investor group. The government has also taken certain special rights to be present at the meetings as an observer, requiring written consent for the removal of any articles of association and for approval of certain special appointments. The British pattern is virtually true of almost all countries, though the nature of control differs. A divestiture makes the break from the earlier character of public enterprises only in the sense that the government tradition of continuing with the monopolist control function lapses, though no government has abdicated full control.

Regulation after privatisation has been invariably a thorny issue. It would not do to privatise without a rigid regulatory framework. Where markets cannot determine costs and profitability, the regulatory bodies will have to do so. Experience in many of the developing countries is that a private sector running public utilities can, with the help of the state and without an independent regulatory agency, make the whole system more inefficient. In the case of monopolies and utilities, particularly such as gas, water and electricity, market forces can, without a regulatory intervention, generate dislocation and exploitation. In the privatised utilities, British Gas, Water and British Telecom,

the regulatory authority is, in fact, stepping into the shoes of a market maker;⁷ otherwise, these would tend to become self-serving organisations. In the case of units which are sought to be privatised and where competitive conditions are difficult to create, as in most of the developing countries, it is extremely important, as a pre-condition, to set up a strong regulatory body which performs the watch-dog functions from the beginning itself.

Lastly, an essential precondition for the success of privatisation is the reform of the private sector itself. It has been fashionable to talk of the reform of the public sector, but it is no less important to ensure that the private sector behaves responsibly. The crucial issues concern corporate disclosures and the corporate ownership pattern, with large family or business houses with entrenched concentrations of economic power. An extensive programme of divestiture, it is not far-fetched to visualise, could reinforce the existing patterns of economic power and control. These could frustrate any deregulation and competition policy, if some of the recent instances are any pointers. This is not to argue against privatisation but to stress the highly critical role of the regulatory and statutory agencies to enforce efficiency in the overall public interest. We can ignore the risk of conversion of public monopoly into private monopolies at our own peril.

Reduction of the fiscal deficit is important but the mechanical process of raising resources for the budget should not guide the modalities of a privatisation policy. Privatisation is not itself a development strategy; it has to be fitted appropriately within the framework of a development strategy.

Privatisation does not necessarily mean reduction in the role of the state; it requires an effective state, with the political will to create conditions for industrial efficiency, productivity and technology. Any policy thrust that has as its sole objective the reduction of the fiscal deficit will, sooner than we expect, result in serious market failures.

Jealousy of Possessions

Jeena Khatkhate

The Indian (from Bharat, that is India) comes to the America of Columbus aggressively determined to establish his identity, but as he begins to feel increasingly American his obsession with his Indian identity evaporates and he strives constantly to disidentify himself with Indians.

A FEW centuries ago, Columbus came to the shores of what is known as modern America and called its natives 'Indians'. It was sacrilege then, as it is now. How could anyone call the cultureless, 'tribal' people, steeped in ritualistic cannibalism, Indians? The people of Aryavarta, who created one of the greatest civilisations of the world and enriched a philosophical domain, deserved better than to be identified with the barbaric natives of America of some mere four hundred years ago. The Indian (from Bharat, that is India) now comes to the America of Columbus, resolutely trying to establish his identity. When he meets an American, he harks back to his Indian prototype and curses himself that the American does not behave like an Indian. He is distant, callous, artificial, synthetic, outwardly pleasant but inwardly rude. He visits a department store, but what troubles him is the 'deafening discord' he hears from the metronomic beep and stutter of the cash register. That evokes in his mind the picture of a "wizened old man back home who gingerly put the weights onto his scale, weighed the potatoes, counted the change, and talked about his son". He goes to a bank to open an account and feels put off by the bank which identifies him not by his name, but by an alphanumeric symbol. He is disquieted by his alienation, but he wants to remain in a society where he sees neither his past, nor his present, nor his future; he consoles himself that "maybe constant alienation is a healthy antidote to the threat to individualism in a foreign culture".

If the young man who arrives in America thinks in old ways, the old man who comes here to settle thinks in ways befitting his ancient traditions, scriptures, and culture. He will see divorces around him, and mope over the decadence of American families; he will see young girls and boys dating and curse their sexual promiscuity while reminiscing over the virtuousness of his youth. He will look at the

morning papers for news about India and set them aside as useless. If India does not figure in the news or is given only a little space to describe some railway accident or a communal riot, he will condemn the self-centredness of American journalism. Yet when newspapers flash on their front pages the riots following the Ratha Yatra, or the Kashmir insurgency or the Punjab shootings, his blood boils. These cursed Americans revel only in showing the worst that is happening in India. Why are American art critics raving over Peter Brook's *Mahabharat*? Bhishma is black, Karna is black, Gandhari is black. How can Aryans as fair as the Greeks be black? Even our greatest epic is vulgarised by the West. They would then conclude that the society which they are blessing not only by their visits but also by hankering after permanent resident visas is rotten to the core.

But time is a healer. The ardour for identity evaporates with the efflux of time. The Indians' loathing for Americans undergoes a radical change. After all, if we live in America, what can we do except tolerate them. And if you tolerate them, then why not choose the best amongst them—the white. The blacks, they come from the bush; they live in slums; they are drug addicts; they are violent; they are not people we should break bread with. And relationship with them by marriage? Never! With white Americans, yes, of course.

As they feel increasingly American, they give up their obsession with an Indian identity and strive constantly to disidentify themselves with Indians. You see many Indians who, running into other Indians for the first time, will try to use every device to identify their caste, their language and their possessions. Somebody's last name sounds unfamiliar, somewhat unusual. Who could he be? A Tamil, an Andhra, a Brahmin? Is he well placed? Otherwise he will be a pest; he will ask for some favour which I cannot,

do not want to, bestow. Why should I when he does not belong to my caste, does not speak my language? Better I preserve my powers to do good only to the privileged few. If Indians are holding important positions in international organisations, they have to guard themselves from contamination by other Indians. What if they were to ask for favours? How would I look in the eyes of the Europeans or the Americans, if I am seen helping the brownies? I have to maintain my image as an international civil servant, above board in every respect! After all, it is wrong to expect a highly placed Indian in an international organisation to be a Salvation Army man offering succour to all and sundry Indians. Not doing good does not mean doing bad is expunged. You can be a hatchet man for someone above you and damn if the victim is an Indian. This too proves your non-parochialism. So the excluded Indians almost say to themselves what president Havel said when he assumed the presidency: "I would only add that, in my opinion, the hidden motivation driving all my dogged efforts is precisely this innermost feeling of being excluded, of belonging nowhere, a state of disinheritance as it were, of fundamental non-belonging. The real reason I am always creating something, organising something, is to vindicate my permanently questionable right to exist!"

However, the malign neglect of the unlucky fellow Indians suddenly becomes benign if perchance he falls on evil days. There will be gallons of crocodile tears shed. Some help may be offered knowing full well that things have gone beyond redemption. In social relationships, Indians reveal their arithmetical and mathematical skills. If one is prospering, they divide his virtues, if one is down and out, they multiply his vices.

The Indian society in the US thrives on jealousy—caste jealousy, religious jealousy, language jealousy, the jealousy of one's own possessions and the possessions of others. As in the case of the Pacific Islanders, jealousy of possessions is the key to the Indians' culture. Thus their identity is with their old habits, old mores, old modes, while they are busy disidentifying themselves from their compatriots. They are like philosopher Kant's timber, "so crooked as that from which man is made, nothing entirely straight can be carved".

Constraints on Economic Policy Price of Profligacy

B Gopalakrishna Kumar

While the short-term economic problems may at first sight look daunting, they are tractable compared to the longer-term questions which will essentially determine the possibilities of development in the nineties and beyond.

AS negotiations with international agencies continue to arrange financial assistance in helping the country tide over its external payments crisis, the government appears to be confident that the worst is over and that the ignominy of a default on loan obligations—which looked a real possibility just two months ago—has been staved off. Meeting the press in Vancouver, the finance secretary was recently quoted as saying, "We will continue to maintain an impeccable record on debt service and on contractual payments." In what must have been music to his ears, the Aid-India Consortium at a meeting in Washington in the last week of April apparently pledged one billion dollars to help India meet its balance of payments problem for the next three months.

On the foreign exchange front, it appears that the country may be just about keeping its head above water. The Reserve Bank has recently further tightened the screws on domestic industrialists: first, by hiking the margin on letters of credit (thereby making it even more difficult to raise foreign exchange for imports); second, by augmenting interest charges on delayed export realisations and decreeing that exporters will get replenishment licences only on repatriation of earnings, not on shipment as before, and third, by putting pressure on banks to restrict the granting of fresh credit to industrialists. Since a huge amount of money—in the region of one billion dollars—is tied up in unremitted export proceedings, measures on this account are intended to help convert blocked funds into liquid cash. Curbs on bank lending, on the other hand, sound more like a good old-fashioned credit squeeze with the aim of bringing down the level of economic activity and thereby achieving a lower external deficit at a reduced level of domestic output.

Despite the grim resolve that is sought to be demonstrated through the imposition of these measures, there is really no dispelling the sense of crisis that seems to have set into the body politic in recent months. India's short-term debt is esti-

mated at \$4 billion. This is a reflection of the predilection of previous governments to maintain growth rates at any cost even if it meant getting into risky short-term commitments with international financiers. Now that the chicken have come home to roost what is urgently needed to ward off a repayment crisis is a large medium-term loan to give the country some breathing space. It remains to be seen whether this will materialise.

The short-term macro objectives and their underlying constraints can be simply stated: they are to ensure that attempts to curb the external imbalance and in particular restrain the growth of imports take place in a graduated manner until the domestic situation stabilises and the second round of loans from Fund sources can be mobilised along with further slices of commercial loans when and if the country's credit rating improves. There is, therefore, a need to prioritise import reductions; and here it must be said that across-the-board measures like the RBI's recent restrictions, notwithstanding some relief given to the diamond industry, do not sufficiently differentiate between essential and non-essential production. Many small companies which contribute substantially to export earnings will simply be unable to find the cash to deposit the 200 per cent margin on letters of credit. Further, wholesale credit restrictions, even on borrowers which secure their raw materials entirely from domestic sources, are a recipe for imminent stagflation. It is vital, generally speaking, that full support continues to be given to exporters, even as the inevitably painful squeeze on imports is applied. Otherwise, there is the obvious danger that whatever is gained on import reductions will be offset by shortfalls in export earnings, particularly in sectors where export earnings are import dependent.

BEYOND JUNE

Beyond June, a different script will have to be written. A much larger loan than

was made available in the first instalment will probably be negotiated under the IMF's Extended Fund Facility. It is clear—whatever the government of the time says—that the IMF will impose conditions. The governor of the Reserve Bank has recently disclosed that the country's current account deficit had soared to 3 per cent of GDP last year. In today's terms, a deficit of the order of \$8 billion (or Rs 16,000 crore) is not very good news in terms of the macro-economic adjustments required. If the IMF asks for an adjustment similar to the one agreed upon on the last occasion (in 1981) when a large loan was negotiated, the deficit will have to be brought down to around 1 per cent of GDP. This means that the country will have to reduce its current account deficit by Rs 12,000 crore in a reasonably short time (perhaps three years). Export growth by itself cannot bring this about, given the situation in the international economy and the hardening of protectionist tendencies in many potential markets in the EEC and elsewhere. In this context it is doubtful whether even a fuller devaluation of the rupee (as opposed to the gradual depreciation of its value that has been taking place in recent years) will add much to our export performance. It is also unreasonable to think that other inflows (such as NRI balances or foreign inflows) could in any way foot the bill. It thus seems inevitable that in the medium term a cutback in imports combined with a reduction in domestic absorption should be on the cards.

One aspect of the crisis on the external front has to do with essentially extraneous factors, namely, a vastly heightened threat perception which keeps defence expenditure at unsustainably high levels. The RBI governor in fact recently also admitted that one of the most immediate reasons for the huge trade deficit is the volume of defence imports that the country committed itself to; the problem is complicated by the fact that this import expenditure has not been properly accounted for. Unless something is done on this front, the burden of adjustment will fall entirely on other sectors and the process will be even more painful than it ought to be.

A second equally important aspect of the current scene is that it has brought into sharp relief an endemic feature of our economic system, namely the extent to which it is dependent on doles and hand-outs to various interest groups, the cumulative effect of which is to keep government expenditure commitments at a very high level, and which ultimately

serves to rob policy-makers of any alternatives that might otherwise have emerged.

Take the mounting bill on subsidies alone. The total amount of subsidies in 1990-91 came to around Rs 10,000 crore (taking up roughly 10.5 per cent of total expenditure), of which the food and fertiliser subsidies took up Rs 2,200 crore and Rs 4,000 crore respectively (with the export subsidy coming to around Rs 2,610 crore). It is well known that a large component of the fertiliser subsidy is regressive in nature and that the beneficiaries are on the whole prosperous agriculturists who, in addition, are not income-tax payers. The food subsidy, though undoubtedly more justifiable, ultimately really benefits only urban households (except in a few States like Kerala) whereas the majority of the poor are in the rural areas. In addition the PDS bill has been inflated by large numbers of bogus ration card holders. (It has been estimated that a pruning of the fertiliser subsidy which would raise the price of fertilisers by 20 to 30 per cent would entail only a marginal increase in the overall cost of production. Similarly there is scope for streamlining the operation of the food distribution system, and diverting the savings for expanding the operation of food for work programmes in rural areas.) In addition to these costs, the tax payer spends crores of rupees on hidden subsidies: for instance, he by and large underwrites the huge losses suffered by state electricity boards. According to some estimates, once all this is taken into account, the total bill on account of subsidies will mount to Rs 20,000 crore.

Besides the subsidy element, the expenditure commitments of the government increased several fold since the seventies. Large public sector pay increases were conceded, including much larger allocations for defence pensions. Against the backdrop of a deteriorating law and order situation, government administrative expenditure itself increased at a dramatic rate, registering a compound rate of growth of 20 per cent per annum over the eighties.

WEAK MULTIPLIER EFFECTS

These developments are largely mirrored in fiscal trends that became apparent in the last two decades. The revenue deficit widened sharply, and the government increasingly had to borrow, first from the RBI (defining the so called official level of deficit financing) and, secondly, and more importantly, from the public. The bulk of the borrowing was used to finance current government consumption expenditure including debt servicing. As a result, whereas the ratio of Central government debt to GDP was 37.1 per

cent in 1980-81, it shot up to 51.7 per cent in 1989-90. In fact, the fiscal year that ends on March 31, 1992 will be the last in which borrowings will have any surplus over debt servicing (estimated at more than Rs 23,000 crore in 1991-92, i.e. one-fourth larger than that in 1990-91). In future, unless there is some unexpected improvement in government finances, domestic borrowing will fall short of debt service requirements.

The increase in expenditure and the resort to debt need not have caused such severe macro-economic dislocations if the expenditure had substantial multiplier effects on the economy. It is often held that government deficits 'crowd out' private saving, that is, the burden of debt financing together with its servicing component makes the government soak up the available private saving for its own use, whereas it could have been put to more productive use by private individuals. This kind of thinking permitted the criticism levelled at the large government deficits in the Reagan years in the US, culminating in the so called Gramm-Rudman amendments calling for constitutional limits to deficit financing.

Arguments of this kind, however, neglect to point out that private investment activity is often too weak to make use of the saving that individuals would supply and that in such cases the economy operates below capacity because there is too little spending relative to the available saving. In these circumstances, government spending and even deficit financing could absorb private saving that would otherwise not be used. There is considerable evidence that such 'crowding in' between public and private economic activity existed in the Indian economy till at least the late sixties.

Several factors pointed in the subsequent period to reverse this trend. First, public investment which had shown substantial complementarities with private economic activity went into a cyclical downturn in the eighties. Second, the pattern of economic growth in the seventies and eighties, following a period of gradual lifting of controls on private investment activity, was oriented less to manufacturing items and more to consumer durable and service sector products. This meant that the process of industrialisation became more and more import dependent, initiating the start of the pressure on the external front witnessed today. Finally, the effects of the large growth in government employment noted above not only strained government finances but also added a large chunk of middle class demand for consumer durables, many of which were, as we have seen, largely import fuelled.

The difference in the character of growth in the two periods thus made it more difficult for any of the complementarities noted above to take effect. Rather the process of growth simply became debt-financed instead of investment financed and government expenditure increasingly began to draw on the extent of savings available in the economy. Adding to the shortage of investible resources was the progressive failure to mobilise more revenues, and greater and greater reliance on indirect taxes and instruments like administered price hikes—which have an in-built inflationary potential—as a way of garnering resources. While certain sectors of the economy witnessed fast growth, total employment growth fell over the seventies and eighties. Organised sector employment, which registered growth rates of more than 5 per cent per annum in the 1960s, fell in the next two decades: between 1983-87, it grew only by 1.4 per cent per annum.

HARD DECISIONS

The government is therefore in a quandary, from which it cannot escape within the current rules of the game. Given the current limitations on resource mobilisation and difficulties in cutting expenditures, the state has to get deeper into debt to fulfil even existing commitments, like the inhabitants of Alice's Garden of Wild Flowers, it simply has to keep running to stay in the same place. A number of consequences follow from this state of affairs: first, in the short run, by cornering so much of the available funds, the government has been rail roading other borrowers on the capital market; second, in trying to persuade the public to buy its paper, the fisc has been pushing up the rate of interest on government securities, making returns on other equity and deposits look less and less attractive. But in the longer term, the consequences are that an imbalanced macro-economic structure, that lacks any of the characteristics that could promote sustainable growth and employment, has been set into motion.

Breaking out of this bind will call for a number of hard decisions which will have implications much beyond the immediate fiscal adjustments that the IMF may call for. It is first important to see what should not be done. One option which a future government may take in order to meet a hypothetical target reduction in the budget deficits is to make token cuts in revenue expenditure here and there, with perhaps a bit more of the ersatz privatisation involved in disinvestment of selected government equity holdings in public corporations, and then take a large swing at capital expenditure. This would

have the merit of avoiding a confrontation with any entrenched interest group. There were clear indications of this kind of thinking in the finance minister's mini budget speech on the occasion of the vote on account. But this would be irresponsibility at its worst, not just because it would put future development efforts in jeopardy (and notably muddy any prospects of finalisation of the Eighth Plan, already delayed by a year) but also because it would simply postpone the hardest decisions as regards government's economic policy.

The policy changes which are likely to have the highest pay-offs are in the area of government expenditure and its reorientation into more productive areas, a cutting down of inessential imports (including the

large and unscrutinised defence component already alluded to) and much greater attempts at harnessing resources so that they can be redeployed to revive falling employment growth. In the longer term, much more concerted efforts at improving the country's abysmal record in granting basic literacy to its citizens will also be needed if the productivity gains of better human resource endowments are ultimately to be reaped here as they already have been in South Korea and other south-east Asian success stories.

In sum, while the short-term problems may at first sight look daunting, they are tractable compared to the longer-term questions which will essentially determine the possibilities of development in the nineties and beyond.

Social Background of Kerala District Council Members

George Mathew

A study of the social background of the newly-elected members of the district councils in Kerala brings out many interesting aspects of Kerala's socio-political and economic set-up and some characteristics of the emerging political leadership.

A SURVEY was carried out under the auspices of the Institute of Social Sciences, New Delhi, to understand the social background of the newly elected district council members in Kerala. The Kerala district council election, held in January, attracted national attention because of three important reasons:

(i) This was the first election after vesting the district councils with enormous powers (about 150 subjects have been transferred from the State to the districts), which will make Kerala a federation of districts, a unique feature in the panchayati raj system in the country.
(ii) National and international issues like the Gulf War, the Mandir-Masjid dispute, reservation for backward castes, etc. were the determining factors in this election to the local bodies, more than local issues.
(iii) The Congress(I) could not gain control of even a single district and, contrary to the usual electoral experience, the ruling LDF gained absolute majority in 12 out of the 14 districts. In one district there was a tie between LDF and UDF and the other, Malappuram, went to UDF because of the Muslim League.

The main aim of the study was to know the kind of leadership emerging at the local level in the State. Local self-government—at the district and below—is, no doubt, the nursery for a healthy and

vibrant democracy and therefore such a study was considered significant when there is serious thinking on amending the Constitution to give panchayati raj the prime place in our polity.

The Kerala district councils have 474 seats. Out of that two members had expired when the survey was conducted and thus the effective strength was 472. Out of 472 members, 363 (77 per cent) responded from all over the State. All members from the districts of Wayanad and Alleppey responded. In Trivandrum district, out of 40, 39 responded and in Pathanamthitta district, 22 out of 23 responded. While the response was 75 per cent and above from Quilon, Kottayam, Ernakulam, Trichur, Palghat, Malappuram and Cannanore districts, the lowest response came from the districts of Idukki and Kasargodu. The data were collected through interviews with questionnaires.

The result of the survey reveals many interesting dimensions of Kerala's socio-political and economic set-up and emerging characteristics of the political leadership.

(1) Out of the 363 members interviewed, 125 were women and 238 men. That is to say, women members were about 35 per cent of the total elected members, which is well above the 30 per cent reservation for women proposed in the national

legislation. This means a large number of women fought non-reserved constituencies against men and won.

(2) Only 14 per cent of the members are unmarried.

(3) The religious composition of the members is almost proportionate to the population pattern existing in the State. Hindu members are 57 per cent (percentage of Hindus in Kerala 58.15), Christians 23 per cent (the State has 20.56 Christians) and Muslims 17 per cent (Kerala's Muslim population is 21.25 per cent). The drop in percentage of Muslim members could be attributed to the low response we got from certain districts where Muslims are in a majority. Moreover, eight members had not specified their religion.

(4) 17 per cent of the members belong to Scheduled Castes and Scheduled Tribes. This is much higher than the State's SC/ST population. Percentage of SCs in the State is 10.02 and that of STs 1.02 only. Members belonging to the Other Backward Castes (OBCs) are 31 per cent. About 16 per cent members have refused to identify their caste, saying they do not believe in caste. Interestingly, all of them belong to the Communist Party (Marxists).

(5) Kerala has a preference for younger leadership. 26 per cent of the members belong to the age group (21-35 years); 50 per cent belong to the age group (36-50 years). Thus, 76 per cent of the members are below 50 years. Those who are 65 and above constitute only 2 per cent.

(6) The State is well known for its rural-urban continuum. 79 per cent of the members are from villages and only 21 per cent live in town areas. In a way, these towns in Kerala are also extensions of villages. According to official statistics Kerala's rural population is 81.26 per cent

TABLE 1: AGE DISTRIBUTION OF ELECTED MEMBERS OF KERALA DISTRICT COUNCILS

| Age Group | Total Number | Percentage |
|-----------------|--------------|------------|
| 21-35 | 94 | 25.89 |

| Any other | 23 | 6.34 |
| Not ascertained | 158 | 43.53 |
| Total | 363 | 100.00 |

TABLE 5 NEWSPAPER READING HABITS OF ELECTED MEMBERS OF KERALA DISTRICT COUNCILS

| | Number of members | Percentage |
|------------------------------------|-------------------|------------|
| <i>No of newspapers read</i> | | |
| One | 10 | 2.75 |
| Two | 41 | 11.29 |
| More than two | 300 | 82.64 |
| Not ascertained | 12 | 3.30 |
| Total | 363 | 100.00 |
| <i>Language of Newspapers read</i> | | |
| English only | 2 | 0.55 |
| Malayalam only | 157 | 43.25 |
| Both English and Malayalam | 174 | 47.93 |
| Any other | 5 | 1.38 |
| Not ascertained | 25 | 6.89 |
| Total | 363 | 100.00 |

sets, commercial vehicles, etc. 5 per cent say they have no assets. Coming specifically to the ownership of land, 60 per cent of the members own land and 13 per cent are landless. It needs to be mentioned, however, that 5 per cent women members have indicated that they do not own any land, the land could be in their husband's name. Therefore, the percentage of landless could be less than what is indicated above.

Interestingly enough, a large number of members (up to 27 per cent) hesitated to indicate whether they own assets or not. This again could be attributed to the factors mentioned above.

(8) Needless to say, given the unique characteristics of Kerala, all the members are literate. 51 per cent has completed higher secondary, 28 per cent are graduates, and 13 per cent are post-graduates. Those who have studied up to primary school only form just 7 per cent.

(9) Regarding their occupational background, 45 per cent stated they were full-time party workers. 10 per cent are agriculturists and 5 per cent are in business. While 7 per cent are primary school teachers, 5 per cent are secondary school teachers and an equal percentage are college teachers. It is interesting to note that in the entire sample there is only one member who is a contractor.

(10) About 13 per cent of the members are in law by profession, 3 per cent in engineering and about 2 per cent practise homoeopathy/ayurveda. 7 per cent have B Ed and M Ed degrees. Interestingly enough, no doctor (allopathy) is a member of any district council.

(11) The print media's place in Kerala's social and political life is well known. Therefore it was not surprising when all members rightly claimed that they read newspapers. 83 per cent read more than two newspapers, 11 per cent read two newspapers and 3 per cent read one newspaper a day. 48 per cent read Malayalam as well as English newspapers. It may be noted here that although Kerala is a small State it has in Malayalam language alone 114 dailies, 121 weeklies, 103 fortnightly and 527 monthlies.

(12) From the study we find that 19 per cent of the members elected are from families having a political and public life tradition. 18 per cent indicated that their fathers were in politics and more than 1 per cent have indicated that their mothers were active in public life. 7 per cent indicated that other members of their families were in politics and public life. 32 per cent are from families entering public life or politics for the first time. Among

TABLE 6 INVOLVEMENT IN POLITICS: THE PREVIOUS GENERATION OF FAMILY MEMBERS OF ELECTED MEMBERS OF KERALA DISTRICT COUNCILS

| | Number | Percentage |
|----------------------|--------|------------|

| | Number | Percentage |
|----------------------|--------|------------|
| Brother | 67 | 18.46 |
| Sister | 5 | 1.38 |
| Husband/wife etc. | 40 | 11.02 |
| More than one member | 32 | 8.82 |
| No involvement | 102 | 28.10 |
| Not ascertained | 117 | 32.23 |
| Total | 363 | 100.00 |

them 20 per cent have their sisters/brothers in politics or public life while 11 per cent have indicated that their husbands/wives were already in politics or public life.

(13) 10 per cent of the elected members have lived and worked outside India. Among these, 32 per cent had lived and worked in Gulf and the remaining in other countries.

CONCLUSION

This survey shows that the members elected to the district council are educated and are exposed to issues and developments outside their State. Their reading habits and interaction with people outside the State and the country have a significant bearing on their perception of civic life and political understanding. That is the main reason why broader issues of national and international importance affect the Kerala electorate even in local bodies elections.

Secular ideals have made deep inroads into Kerala society. For example, a 37 year old woman respondent from Malabar has said that she had education up to tenth class (secondary school). She reads more than two newspapers a day. She is a member of the board of the District Co-operative Bank and co-operative society. She refused to indicate the caste to which she was born.

[I am grateful to Gurus Kumari and Archana Ghosh of the Institute of Social Sciences and H N Singh of the Jawahar Lal Nehru University for their assistance in the preparation of this note.]

Health Damage due to Bhopal Gas Disaster

Review of Medical Research

Rajiv Lochan

The findings of the various studies undertaken by the Indian Council of Medical Research in Bhopal are beginning to produce medical evidence of the enormity of the Bhopal Gas Disaster.

CONSIDERING the enormity of the health damage caused due to the Bhopal disaster the scientific information available on the health status of the victims of the disaster is far from adequate. Lack of scientific information has led to an underestimation of the damage caused by Union Carbide Corporation. It has also impeded the emergence of a proper line of medical treatment for the gas victims. Most of the large scale attempts to generate information have been carried out through studies conducted by the Indian Council of Medical Research (ICMR). It is indeed unfortunate that even this information and the implications they carry have not been made available outside a limited circle. This note is primarily an attempt towards dissemination of the information generated by ICMR.

After the gas disaster the ICMR initiated studies on the effect of the gases that leaked on the night of December 2-3 1984 from the Union Carbide pesticide factory. In all, ICMR took up 27 projects that were directed mainly towards the study of the effects of the gases on the respiratory, reproductive, gastro intestinal, ocular systems of the affected people. A few studies were carried out on the impact of the gases on children of various age groups. The sample populations for the studies were taken from among the gas exposed people and for comparison a sample population from the non gas exposed areas (control area) were made part of the study. The data for the studies were collected both from hospital and through visits to the community. The ICMR has established a special centre for carrying out the studies known as the Bhopal Gas Disaster Research Centre (BGDRC) which has carried out the only extensive medical studies in the aftermath of the Bhopal disaster. The findings of the ongoing studies are reported in the annual reports published by the centre which are the data sources for this article. In places findings of sample studies have been projected to cover the estimated gas affected population so as to arrive at an overall assessment. Along with the estimation of health damage caused by the Bhopal disaster we

also consider the health care costs that would need to be borne to deal with the large scale and serious damage. It is understood that such health care will have to be provided to the gas affected population at least for the next 20 years. Given that the suit for damage pressed by the Indian government on behalf of the gas victims against Union Carbide is yet to be decided, all medical findings and analysis based thereon have legal implications.¹

Though a number of studies have been carried out only those studies are considered here in which the health effects in the study area are found to be significantly higher than those found in the control area. Health effects of the toxic gases and the costs of health care for individual health problems have been discussed with reference to these chosen studies.

According to the 'Long Term Epidemiological Study on the Health Effects of Toxic Gas Exposure' (principal investigator, M. P. Dwivedi, director Bhopal Gas Disaster Research Centre) the total estimated exposed population in 1984 was 5,21,262. Of this population 32,477 were in severely exposed area, 71,917 in moderately exposed area and 4,16,869 in mildly exposed area. A population of 80,021 (20.3 per cent) of the total was covered by the ICMR study. The division of the entire gas affected area into mild, moderate and severe areas has been done on the basis of exposure related mortality rates in the immediate aftermath of the disaster.

According to this study the abortion rate was 7.63 per cent in 1990 in the affected area while in control area the rate was 3 per cent. The abortion rate is decreasing in the gas affected area gradually. It came down to 7.63 per cent in 1990 from 8.22 per cent in 1989. At this rate it will take about nine years to attain the control area rate. During these nine years 3,568 abortions would be due to gas exposure. An estimated Rs 1,000 is required for health care in the case of abortion which means Rs 3.56 million will be required for health care of the gas-affected women who have undergone abortions.

The people who have gas exposure

symptoms at the end of six years are, obviously, 'permanently' rather than just 'temporarily' injured. The symptomatic population among all gas victims is 30.52 per cent and is increasing year after year as the injury has affected their body systems irreparably. In the control area the symptomatic population is only 18.94 per cent. This means that 60,632 additional people are suffering from gas exposure over and above the control area figures. For the care and cure of this general morbidity at least Rs 10 per person would be required. Although the number of people suffering from general morbidity is increasing in the gas hit areas, for the sake of simplicity if we take this number to be stationary then the money required only for the medicare of this morbid population would be for Rs 1.45 billion (Table 1).

LUNG INVOLVEMENT

Various studies have established the severity of effect on lungs due to exposure to toxic gases in Bhopal. According to this study (principal investigator N. P. Mishra) 98.4 per cent of the gas exposed population was found to be having exertional dyspnoea and it was found to be progressive in some cases. Recurrent respiratory infections (73.4 per cent), chest pain (42 per cent), joint pains and easy fatigability are the other common symptoms.

About 24 per cent of the gas affected population have Reactive Airway Dysfunction Syndrome (RADS) in which the patient had paroxysmal attacks of breathlessness following toxic gas inhalation. In

TABLE 1. GENERAL MORBIDITY TREND (SYMPTOMATIC)

| Time Period | Per Cent Morbid Population | |
|----------------------------|----------------------------|--------------|
| | Affected Area | Control Area |
| May 4 to Nov 3 1987 | 15.26 | 4.24 |
| Nov 4 1987 to May 1988 | 15.69 | 8.05 |
| May 4 to Nov 3 1988 | 16.15 | 5.55 |
| Nov 20 1988 to May 29 1989 | 23.01 | 17.26 |
| May 30 to Nov 21 1989 | 26.14 | 18.50 |
| Nov 22 89 to March 31 1990 | 30.52 | 18.94 |

TABLE 2. MENTAL HEALTH STATUS (Per 1000 Population)

| | Severely Affected Area | Mildly Affected Area | Control Area |
|---------------------|------------------------|----------------------|--------------|
| Anxiety state | 30.2 | 20.91 | 5.71 |
| Neurotic depression | 15.10 | 17.25 | 7.99 |
| Others | 2.03 | 2.21 | 1.14 |
| Total | 48.13 | 7.77 | 14.84 |

TABLE 3: GROWTH FAILURE IN CHILDREN BORN TO GAS-EXPOSED WOMEN

| Age of Children (Months) | Failure Rate in Affected Population (per cent) | Failure Rate in Control Population (per cent) |
|--------------------------|--|---|
| 12 | 11.47 | 10.36 |
| 18 | 13.03 | 16.26 |
| 24 | 12.92 | 10.57 |
| 30 | 8.78 | 4.81 |
| 36 | 13.25 | 7.25 |
| 42 | 15.43 | 13.02 |

the control population such symptoms were presented by 2 per cent of the population. Research studies have shown that RADS could persist for several years after the injury. It is also likely that a number of persons with RADS will turn into cases of asthma and the disease would become incurable. Symptomatic treatment with regular use of bronchodilators is the only course of treatment for such patients. It is safe to assume that there are at least 1,14,677 persons whose symptoms can be related to inhalation of toxic gases. Considering that treatment of paroxysmal attacks will cost an estimated Rs 1000 per person per year for the next 20 years the total cost of health care of persons presenting RADS will be Rs 2.3 billion.

Detailed lung-function tests reveal that 11.4 per cent of the gas victims have Chronic Obstructive Airway Disease (COAD) as against only 4 per cent in the control population. The national average for this disease is only 1.7 to 2.2 per cent. A significantly high number of victims (even young non smokers) have developed COAD as a result of toxic injury to the airways. That means 38,573 persons are suffering with COAD above the control area figures. COAD is a progressive and deteriorating disease. For its medical treatment at least Rs 1,000 will be required per year per person for the next 20 years on average. That means Rs 77.1 million will be required (Table 3).

The study of small airway function among the gas affected population revealed that almost all the patients (97.5 per cent) had evidence of small airway obstruction. In the course of the study risk parameters were identified for positive identification of small airway obstruction and it was found that 60.7 per cent of the affected population showed the involvement of three or more parameters. In contrast, 74 per cent of the control cases had either no involvement or only one parameter involvement. Such findings have led the researchers to suggest that small airway obstruction be taken as a marker for the diagnosis of toxic gas induced lung disease.

The costs of health care for the 5,08,230 (97.5 per cent) victims suffering from small airway obstruction for the next 20 years at the rate of Rs 1000 per year per person amounts to Rs 10 billion.

OTHER HEALTH PROBLEMS

In the house-to-house survey undertaken between September 1988 and August 1989 by the ICMR, it was found that anxiety neurosis and neurotic depression were the most common psychiatric problems among the gas-affected people (principal investigator B. B. Sethi). The study conducted in 1990 indicates that 48.13 in 1,000 persons in severely affected and 47.77 in 1,000 persons in mildly affected areas were suffering from these mental illnesses as compared to 14.84 per 1,000 persons in the control area. By taking into account figures from previous studies it is possible to conclude that while the incidence of psychiatric illness remains more or less stationary in the control area, 14-15 per thousand, it has been increasing in the gas-affected area. While this incidence was 40 per thousand in 1988 and 42 per thousand in 1989 it has gone up to 47 per thousand in 1990. Even without taking into account this rise, the number of persons whose mental health impairment can be attributable to toxic gas exposures is 1,72,590. Assuming treatment costs for psychiatric illness to be Rs 1,000 per person per year the total cost of mental health care for 20 years comes to Rs 3.45 billion (Table 2).

In one study (principal investigator N. R. Bhandari) the growth of children born to gas-exposed women was monitored considering different parameters. It has been found that the failure-to-grow rate is significant after the age of 18 months (8.78 at the age of 30 months). Children born to gas-exposed women also exhibit a significantly higher delay in gross motor (control of voluntary body movements) and language sector develop-

ment. At the age of 36 months 4.83 per cent children show delay in gross motor development and 6.59 per cent show deficient development in language sector. The circumference of the head of both male and female children was found to be significantly higher in the affected area than in the control area. It was also found that the chest circumference for female children was significantly lower compared to the control population.

The birth rate in the affected area is 29.43 per 1000 population. That is, in the next 20 years 3,06,800 children will be born. With the above maintained failure rates 12,180 more children will show delay in growth, 6,656 children will show delay in gross motor sector, 11,720 children will show delay in language sector development in the next 20 years in the affected area over those in the control area. All these children will require special attention to aid growth. If Rs 1,000 per child were to be assumed to be required for the special care of these children, then Rs 30.55 million will be required (Table 3). It needs to be mentioned that the children covered by this study were born much after the gas exposure to their mothers. Abnormalities found among such children therefore, indicate systemic damage caused by the toxic gases.

The health status of children of age group 6 to 15 years was studied (principal investigator N. R. Bhandari) and was found to be similar to that of the adult population in terms of the nature of ailments. 55.96 per cent of the child population in the affected area had breathlessness while the corresponding data for the control area was only 1.6 per cent. Cough was reported by 61.23 per cent of the affected children as compared to only 2.34 per cent of children in control area. Chest pain was reported by 1 per cent children in the control area while 17.4 per cent complained of chest pain in the affected area. As many as 6.65 per cent of affected children were hospitalised between May 1989 and March

1990 compared to 0.25 per cent of population in the control area in the same period.

An estimated gas-affected population of 5,00,000 will require some kind of health care or other for the next 20 years. The total cost of such health care comes to \$ 1.14 billion. It needs to be mentioned that the total compensation claimed by the Indian government is \$ 3.3 billion and the compensation amount calculated by the Citizens Commission on Bhopal, a US-based coalition of 50 social and environmental organisations, was 4.1 billion dollars. The health care costs arrived at in the present note, therefore, are quite in accordance with the forementioned amounts of total compensation.

Notes

- 1 We are aware that the computations of health care costs presented here also have legal implications and we hope that these computations can help the court in quantifying the liability of Union Carbide once such liability is established. It needs to be made clear,

however, that the computations presented here do not purport to be the total compensation payable by Union Carbide but address the issue of health care costs alone and are thus part of the amount for relief and restitution payable by the offending party in a law suit. However, these calculations do not include health care costs that may need to be borne for health effects that have not manifested so far but are likely to emerge. For instance, the study of chromosomal aberrations by ICMR has indicated their presence among the gas-affected population but has yet to quantify such aberrations. The problem of genetic diseases that may occur due to gas exposure-related chromosomal aberrations are also left out. Nor does it include in its estimation the health care cost that has been borne (both by the Indian government and the gas victims) during the acute phase between December 1984 and the year 1990. Significantly excluded is also the cost of medical surveillance which is an essential task considering that very little is known about the exact nature of the toxic gases and the long-term damage caused by them. As will be apparent, the medical care costs mentioned in the paper are conservative estimates.

Wastes Not Wanted

Satyaban Sarkar

The control of toxic wastes which are polluting our river waters rapidly merits urgent and special attention.

At a recent workshop in New Delhi, representatives of WHO and the Central Pollution Control Board once again expressed concern about the extent of river water pollution in India. The Yamuna, for instance, is highly polluted because of the dumping of industrial wastes from 50,000-70,000 small-scale industrial units operating in India's capital. In Bihar the Son river has the highest fish mortality rate amongst all rivers and its once thriving carp fishery has been wiped out by discharges from paper, chemical, cement and sugar factories. The indiscriminate dumping of lethal cyanide wastes in Ezhinagar canal from electroplating operations has caused buffalo deaths in Madras. The control of toxic wastes is a small focus on the large canvas of environmental pollution control measures, but it merits special and urgent attention.

In the manufacture of some industrial end-products, highly toxic by-products are released and are difficult to neutralise. There are also some chemicals which serve useful purposes but have to be safely disposed of once they have been so used. The pesticide industry, manufacturing synthetic organochlorine and organophosphates, etc, is an example of this. Dioxin, for instance, is a by-product in the manufacture of certain herbicides and ob-

tained during the bleaching of paper pulp. Extremely small doses of dioxin can cause horrible diseases. America's Environmental Protection Agency sets its safety standards by assuming that any dioxin—even, in theory, a single molecule—is bad for you.

Disposal of seemingly innocent refuse may give rise to toxic products. Every year the average American opens 300 kg of boxes, bags, and other packaging material, then throws it all away, and after a while that adds up to a new landfill, which again is a hazard in its own class. Plastic products are not biodegradable. At best, they may only break up into smaller bits of plastic which stay around and do not decompose in the same way that plant, animal products and pottery do. In bonfires, they give off toxic products—PVC gives off hydrogen chloride, besides such highly toxic and carcinogenic chemicals as dioxins and dibenzofurans. Nylon, some acrylics and polyurethane foam not only spread fire swiftly but also produce hydrogen cyanide. Polyurethane foam at below 600°C gives off a dense, choking yellow smoke that contains isocyanates, including toluene di-isocyanate, a very potent allergen and irritant.

Heavy pollution is being discovered in US bases in Germany as the US prepares

Europe: contaminated airfields where jet fuel has drained into underground aquifer and has migrated outside the military complex, hazardous chemicals and poisonous metals in landfills, toxic chemicals in water tables from dry-cleaning plants. Governments of the industrial North are increasingly seeking to ship this waste to poorer nations and paying them to deal with it. In their own countries, the estimated costs of cleaning up the waste disposal sites are enormous—\$20 to 100 billion in the US, \$10 billion in FRG, and in the non-nuclear, tiny, clean Netherlands \$1.5 billion, *Future Earth*, published by Christopher Helm, London, 1988, p 103.

Shipment of toxic wastes for disposal/destruction within governmental guidelines is big business. The case of polychlorinated biphenyls or PCBs in UK has gone into the political arena, with trade unions stepping up the campaign against import of dangerous wastes without adequate safeguard regulation and forcing disposal contractors into refining their incineration techniques to avoid the generation of dioxins. Incidentally, little is known about how we dispose of our PCB oil or PCB-contaminated material like disused transformer castings.

A mere transfer of location of the waste often does not mean environmentally safe disposal of the waste. Take the case of emissions from coal-fired power stations. In UK, plans to scrub out the impurities that go up the chimney and to discharge the mercury and the chloride into rivers will merely add to the river pollution, and objection has been raised by the UK National Rivers Authority. Nuclear or radio-active waste is a class apart—it will stay around till time can take care of it. Nor can metallic poisons (copper, mercury, etc) be made benign.

Organic wastes can however be rendered non-toxic. One of the most effective treatments for toxic organic waste is to burn it at around 1300°C at which point the chemical compounds break down into their constituents and (in theory) non-toxic parts. The caveat is that the incinerators have to be run super efficiently, otherwise, the toxics will survive the burners, escape into the air and end up in human lungs or intestines, via food-chain, etc.

Bronze age metalworkers phased out arsenic alloys in favour of inferior tin alloys because of the health hazard involved. They knew what was bad for them and acted accordingly. Shall we be so lucky especially in countries like ours where appropriate technology may generate research papers and conferences but not the technology?

Jotirao Phule: An Incomplete Renaissance

Satyakam Joshi
K S Raman

The sharp and manifold increase in the caste and communal struggles of the recent past has made Phule's thought and action more relevant than ever before. A report on a seminar which evaluated his relevance in the present crisis.

JOTIRAO PHULE has once again been in the news, discussions, debates, etc. and rightly so at the time of his death centenary. Phule born at Pune was a pioneer activist and thinker of his times who fought against upper caste domination, exploitation, hypocrisy, and social injustice, and led the Satyashodhak non-Brahmin movement in late 19th century. His manifold contributions to the understanding of Indian society left a deep imprint on Maharashtra society. Unfortunately, so far he has remained as a 'regional thinker' of Maharashtra despite his pioneering contribution.

Many sections of Indian society have been trying to appropriate the 'legacy of Phule' not with a view to continue his unfinished mission of democratic revolution but to legitimise their own interests. It is not a coincidence that the recent crises in India not only reflect the interests of those sections but also suggest the emergence of new caste class alliances in the process of 'democratic revolution'.

Seeing the need to understand Phule's contributions dispassionately against such a background and liberate his image from the shackles of regionalism, the Centre for Social Studies, Surat, organised a seminar first of its kind outside Maharashtra to evaluate his thought and action and understand his relevance in the present crisis. The seminar was held from January 9-11, 1991 with financial support from Western Regional Centre of the Indian Council of Social Science Research (ICSSR). About 50 leading scholars and activists from various parts of India participated and 13 papers were presented. These papers were discussed in five different sessions: (i) Culture, Counter Culture and Ideology, (ii) Peasantry and Peasant Movements, (iii) Relevance of Phule in 20th Century, (iv) Education, Reservation and Caste Politics, and (v) Women, Dalits and Social Oppression. An impressive bibliography of about 300 titles relating to Phule and Phuleism was also distributed by the Centre to all the participants.

I

There were three presentations in first session. J V Naik outlined the genesis and

development of the ideology of Phule. Arvind Deshpande sought to construct a framework to locate Phule in a larger perspective and explain his efforts in creating a 'counter culture' to the existing Brahminical culture. S P Punalekar tried to locate Phule in a larger historical perspective to evaluate his legacy—both his positive contribution to the Indian democratic revolution and its limitations, and grappled with a more crucial question as to why his efforts were unsuccessful.

J V Naik traced historically the external influences on Phule's thought and action. Phule's career, according to Naik, could be assessed into two distinct phases. In the first phase, he was a social activist with local and Western influence and did not try to develop an ideology of his own. His ideas were influenced by Reverend Theodore Parker and Thomas Paine from the West and various socio-reformist movements in India, more notably the struggles of local Kolis and Ramoshis on the one hand and Paramahansa Sabha and Dadoba Tarkhadkar on the other. In the second phase, particularly from 1869 onwards, Phule tried to develop his non-Brahmin ideology which could be discerned in his three celebrated studies of the period—Chhatrapati Shivaji Raju, Bhosle Yancha Powada, Brahmanache Kasab and Gulamgiri.

Punalekar argued that an evaluation of Phule's thought and action was imperative because most of the "contemporary social and political problems and the crises arising out of their irresolution date back to situation and questions raised by Jotirao Phule in mid 19th century." Phule's 'social project' according to Punalekar, had two domains: (a) 'building a theoretical understanding of Indian society and its cultural matrix', and (b) articulating this through some 'radical practice'. He perceived the Indian social system from four dimensions: (i) Social hierarchy and dominance, (ii) subordinated status of women, (iii) exploitation of the primary producers by the state and Shetjis and Bhatjis, and, (iv) religious fundamentalism and casteism. Phule and Phuleism, therefore, should be understood and assessed in overall socio-cultural and political context, i.e. against a background of "economic want, social

neglect and cultural oppression of majority by the minority." However, according to Punalekar the significance of Phule's philosophical-ideological contribution lies in "situating a problematic cultural system, i.e. overarching ideology dominating the thought process and behaviour of the toiling masses."

Punalekar argued that the failure of Phule's social project was related to various questions such as emergence of upper and middle classes among the shudra peasantry, neo-Brahminism among the shudra peasants, etc. and so only through a serious scrutiny of 'the structures of hegemony in Indian society' and their 'changing saliency in a changing socio-economic context' could these questions be properly answered.

Arvind Deshpande suggested that Phule tried to destroy the anti-humanist traditions in India and replace them by a universal humanist tradition. He held that Phule was distinctly different from the erstwhile social reformers. Social reform movement aimed at social change within the framework of culture, whereas Phule had a broader understanding of culture and society. His attack was not just on Brahminism but the social culture of the Hindu.

Phule was the first thinker to classify the Bhat Brahmins not merely as religious social castes but also as economic occupational classes. He was convinced that economic poverty was the main cause of the social backwardness of the masses and was perpetuated by the culture of Hinduism. And hence the need to create a 'counter culture'. In his attempt to create a counter culture—the culture of the rustics, Phule, according to A Deshpande, had to rely upon religion because 'no culture can sustain itself without a religion'. However, Phule decisively broke with the erstwhile upper caste reformers who took an easy recourse to the myths of great tradition, mythology of success, victory, glory.

While creating a culture of the rustics, whose traditions he represented, Phule had to face a dilemma. As a rationalist, he was against superstitions and yet he could not accept a complete severance of ties with the traditions. To avoid this dilemma, he revitalised those elements of the popular mass tradition which could be interpreted as struggles of natives against the Aryans. And secondly, in the process of reinterpretation, he insisted upon a robust rationality that made the supernatural elements ridiculous. Thus the non-Aryan struggle against the Aryans became the local theme of Phule's counter-culture of the masses.

The discussion centred around whether Phule was a reformer or revolutionary and whether the concept of counter culture is adequate and correct. G P Deshpande

held that Phule provided a language to revolutionary theory and wondered whether Phule could be seen only as a part of the reformist tradition. Sharad Patil held that since Phule aimed at abolishing the caste system, he must be hailed as a 'social revolutionary'.

The term 'counter-culture' Sharad Patil claimed, is a term of class societies and is not applicable to a caste society like India. He further said that Phule was the first to define the forces of democratic revolution in terms of caste struggles, i.e., brahminism vs abrahminism. The concept 'counter-culture' is, therefore, not adequate enough for a proper evaluation of the thought and practice of Phule. G P Deshpande argued that a proper evaluation of Phule's legacy not only demands an understanding of 'counter-culture', but also of the counter effects of a reformist movement. Gail Omvedt felt that although Phule was trying to create something like a 'counter-culture', as term is likely to be misused, a better one should be coined.

The question of stratification within the 'shudra peasantry' also generated a stimulating debate. There was a broad consensus on issues such as existence of a stratification within the peasantry, and the mobilisation of the masses in the democratic cultural revolution based on the criteria of caste and class. However, the degree and intensity of stratification within the peasantry remained a controversial issue. Gail Omvedt felt that stratification was not intense enough to divide the peasantry into antagonistic classes.

Ashok Chousalkar argued that in order to give a new cultural orientation to non-Brahmin castes Phule tried to make Bahiraja a cult figure among the peasantry because Phule felt that to bring about a democratic revolution in India, creation of a cultural tradition having popular heroes of non-Brahmin tradition at its heart is essential. That is why his reinterpretation of Bali was not based on mythology but his own Aryan vs non-Aryan paradigm wherein he described Bali as a peasant king who led the non-Aryan combat against Aryan aggression. Thus the myth of Baliraja was essentially a 'political myth' which sought changes in the power relations of the Hindu society.

II

The second session was devoted to the question of Phule and peasant movements. Classes within the peasantry and mobilisation of middle and landless peasants has been a general understanding of 'traditional Marxists'. Gail Omvedt argued that this was a one-sided approach and inadequate (at least in the Indian context) to understand the complexity of the situa-

tion. Instead, she suggested, that the 'process of exploitation' should be central to the analysis.

Phule, according to Gail Omvedt, provided 'an alternative to the supporters of the traditional Marxist analysis of the peasantry'. She dealt with three main themes of peasant exploitation underscored by Phule: (i) imperialist exploitation of the peasantry or accumulation by world metropolitan centres; (ii) supra-village level exploitation by the state and regional elite; and (iii) local exploitation by village-level elites.

Gail Omvedt maintained that supra-village level exploitation has been almost completely overlooked and the role of imperialist exploitation in the post-independent India has not been properly examined. A proper understanding of these themes of Phule, according to her, should broaden the scope of analysis of peasant exploitation—particularly the partial and inadequate analysis of 'traditional Marxists', and thus may be viewed as 'enriching historical materialism'. She therefore regarded Phule as peasantist theorist despite his weak understanding of the role of imperialism and the actual process of exploitation.

Ram Bapat raised a serious doubt whether Gail Omvedt was propounding a 'new peasantist perspective' and providing a theoretical justification. In other words, he felt that she was using Phule to justify Sharad Joshi's (Shetkari Sanghatana) view point. Bapat argued that the forces of world capitalism *vis-a-vis* the forces of national and regional accumulation have reached a particular stage where the latter have been looking for new theories such as the theories of 'undifferentiated peasantry' in favour of their interests. Denying Bapat's interpretation Omvedt said that she did not attempt at model building but was hinting at the plurality of situation.

Sharad Patil tried to differentiate the theoretical positions of Phule and Sharad Joshi. Sharad Joshi, he argued, has built up a new model that challenges historical materialism—that the peasant, not the worker, produces the surplus value, and the Indian peasantry is undifferentiated, whereas Phule viewed the Indian village as one with two clearly divided camps, that is of two castes. Phule was also aware of the differentiation within the shudras. He nevertheless relegated it to the background as he was interested in uniting them against 'Bhatshahi'. He wondered how getting remunerative prices for their produce could emancipate the peasantry from continuing 'Bhatshahi'.

A R Desai objecting to categorisation of 'traditional Marxist' or 'traditional Marxism', pleaded for locating peasant activities in the overall production process. He also stressed the need to identify the

types of exploitation that have been taking place. Punalekar suggested that to understand what Phuleism could contribute to an understanding of the present contradictions, the concept of 'peasant community', rather than 'differentiated peasantry', would probably be more useful if we use it as an historical category.

III

The sharp and manifold increase in caste and communal struggles of the recent past has made Phule's thought and action more relevant than ever before. G P Deshpande claimed that Phule was the first Indian 'system builder' and did provide a 'logic of history', as Hegel did in Europe, because Phule was the first to attempt a transformation of plural categories of history into singular or universal. He, therefore, stands in sharp contrast to Weber's statement that all ideas of universal significance came from Europe. Phule's thought proved that the socio-political struggles of the Indian people could generate a universal criterion. Phule also talked of knowledge and power long before Foucault did. In fact Foucault's post-modernist analysis came at a time when Europe has literally seen an 'end of history', whereas Phule's efforts were to change the world/society with the weapon of knowledge.

A proper understanding of Phule, according to G P Deshpande, should be in the context of and in relation to the Raja Rammohan Roy tradition and the Chiplonkar-Tilak tradition. Phule, influenced by Protestantism, tried to provide an 'internal critique' of Hinduism whereby he was preparing the Indian people to enter into the phase of 'world capitalism'. Eventually, Rammohan Roy's tradition produced its opposite, whereas Phule's tradition unfortunately died down.

J V Naik argued that there was a difference between the traditions of Phule and Raja Rammohan Roy while Sudhir Chandra wondered whether G P Deshpande was indicating Ayodhya as the opposite of Roy tradition. G P Deshpande, responding to the query, clarified that the Rammohan Roy tradition aimed to reform or better the Hindu social system. Its approach was piecemeal. Its limitation was that it tried to reform the high caste Hindus whereas the Phule tradition sought a complete change. This was an epistemological break from the past. He also argued that by opposite of Rammohan Roy tradition he did not mean Ayodhya. Ayodhya was the degeneration of the opposite, i.e., the pluralist religious thinking such as Vivekananda's.

Sharad Patil presented a paper on the methodology of Phule and its contemporary relevance. Contrary to 'Brahmi-

nical methodology' that Hindu society is bound to have upper caste rule, Phule created a non-Brahmin methodology wherein he tried to continue the non-Brahmin folk tradition with the hypothesis of Western scholars, that the non-Aryans were subjugated by the Aryans. This made him conclude, Patil claimed, "that with the fall of Bali the history of India is the history of caste struggles". Patil named it the 'Historical Materialism of the pre-British Indian society'. Patil further claimed that the Indian renaissance is bound to be unfinished as it is still visualised through nationalist and class viewpoints, which are basically 'Brahminical'. Nevertheless, he concluded, the long awaited decisive struggle between the Brahminical methodology and the 'revolutionary positive non-Brahminical methodology has begun. Only its successful outcome can open the way to the completion of the unfinished Indian renaissance.

In the ensuing debate on the categories caste and class, and the concept of class formation within the castes Sudhir Chandra and Arvind Deshpande disagreed with Sharad Patil's view that in pre-British India there were no classes. Patil reiterated that pre-British India was exploited by Brahmin and military castes. He accepted class formation within castes but claimed that this is not enough to 'destroy the caste system'. He argued that the democratic struggles must be organised simultaneously on caste and class lines.

Gopal Guru focused on Phule's views on reservations and the contemporary scenario, while R B Dewasthalee, S Jondhale and B I Bhole focused on Phule's perspective on education. Gopal Guru emphasised the emerging contradictions in contemporary society and the relevance of Phule in that context, from the viewpoint of reservations. Phule wanted reservation on the basis of caste and believed that it would break the monopoly of Brahmins in the field of administration. However, today, a hundred years after the death of Phule, Brahmin vs non-Brahmin is no longer the only contradiction in society. Class formation within the non-Brahmin castes is taking place. And one of the most important contradictions seems to be between the Brahmin and non-Brahmin elites on the one hand and the Dalits, adivasis and women on the other. Gopal Guru concluded with the comment that a 'lack of internal critique' within the non-Brahmin camp was one of the main reasons for their tenuous alliance with fundamentalists.

G P Deshpande questioned Gopal's use of 'internal critique' because it needed a systematic framework applied to a total system. Instead of quoting literally, he further suggested, evaluating Phule in a dynamic sense, i.e., to put in Brechtian terms, bringing the 'historically possible

facts', will help us understand the present reality.

R B Dewasthalee focused on Phule's views on primary education discerned through his memoranda submitted to the 'Hunter Commission'. According to him Phule was the first to plead for the case of universal, compulsory and free primary education. S Jondhale argued that Phule visualised three important purposes of education: (i) a share of lower castes in the employment; (ii) intellectual emancipation from the Brahminical Hinduism; and (iii) facilitating a process of reform from below. One of Phule's most significant contributions was the setting up schools for girls. The relevance of Phule in the contemporary period, according to Jondhale, was in the context of providing education for lower castes and women, and promoting primary education rather than the higher education.

The important tenets of Phule's philosophy of education, according to Bhaskar Bhole, are: to correlate education with day to day life of the common people; to do away with elitism in the field of education; compulsory vocational training in primary education, to eradicate the evils of poverty, superstitious elitist prejudices; and, to offer special concessions and incentives to the students of backward castes. Bhole claimed, that Phule, contrary to the upper caste reformist viewpoint of enlightenment, visualised education as a 'liberating force'. However, the contemporary scene of education, he contended, was essentially neo-Brahminical and non-egalitarian. 'Vidya' in its essence has become 'avidya' and needs to be combated. G P Deshpande raised a doubt that Phule's views on 'vidya' were weak and ambivalent like his views on colonialism and imperialism. He upheld the imperial pedagogy against the Brahminical pedagogy, i.e., one form of domination to the other form of domination.

V

Pushpa Bhawe and Vidyut Bhagwat focused on the women's question as perceived by Phule. Both of them agreed that Phule believed in equality of human beings. Bhagwat however felt that while defending women's role and rights Phule's writings 'occasionally betray biologicistic mode of reasoning'. She concluded that despite this limitation he was a radical supporter of women's equality.

Sudhir Chandra suggested that instead of emphasising the 'uniqueness of Phule' attempt should be made to find historical parallels of his time such as Malbari. Radhakant Barik queried whether Phule's feminism was indigenous or influenced by the West. Gail Omvedt in response ex-

plained that he was a feminist since 1882 onwards, and the influences were shaped by his own experiences in his caste and Pandita Ramabai's Arya Mahila Sabha. G P Deshpande however expressed his doubt whether Phule could be called a feminist, because such specialisation was not possible in the 19th century.

VI

The last session was devoted to the review of seminar discussion; its achievements and shortfalls. One of the most important contributions of this seminar may be the initiation of a process that can redeem Phule as a regional thinker and place him in a larger context. Bapat pointed out that Punalekar's emphasis on the 'structure of hegemony', Gail Omvedt's analysis of 'peasant methodology' and Naik's division of Phule's political career are the first of their kind. G P Deshpande's term 'internal critique' is likely to gain currency in future studies on Phule. However, he said that the seminar was lacking in some important aspects. Most importantly, Bapat felt, that Phule has been seen in isolation. Instead, he suggested, contemporary parallels should have been brought in to locate Phule in 'his' historical context. He also felt that a proper study on 'Phule and Political Economy' is neglected and also proposed a proper textual analysis of Phule's writings.

Arvind Deshpande pointed out some of the missed dimensions in the seminar. He felt that many of the studies missed the individual vs time, space, society context, vital for a historical perspective. He also pointed out that the 'historical rigour' necessary for this kind of seminar was lacking. He suggested that a few studies of the other side of the system to that of Phule would have been more helpful.

All through the seminar the underlying thrust of some of the papers and much of the discussion had been what sections of people should be mobilised for a successful 'democratic revolution' and how they should be mobilised and in what way Phuleism is useful. Many of them also expressed their deep concern about the process of 'sanskritisation' or 'neo-Brahminisation' of shudras and held the reason was the 'lack of internal critique'. Their concern about why 'shudras' can no longer lead the democratic revolution in this country is legitimate but the categories such as 'sanskritisation' or 'neo-Brahminisation' are inadequate to explain it because it is connected with the rise of shudra castes as a part of the ruling classes, which in turn has been clearly connected to the development process that originated since Phule's departure. It is this dimension of political economy that was underemphasised in the seminar.

Gandhi, Ambedkar and Separate Electorates Issue

DN

The objective of Gandhi's 'epic Yeravada fast was to force the dalits, under Ambedkar, to accept their position of being subordinated to the politically dominant sections of the Hindu community

THE British colonialist's attitude towards the press called it a "British Raj Party" supporter. On more than one occasion, it was denied by Kaori Raut. It was brought up once again in the context of the press that took a "British Raj Party" attitude towards Gandhi's fast. The British Raj Party's attitude towards Ambedkar was not as good as Gandhi's. Gandhi used a fast to death to pressurise Ambedkar to accept his terms. This fast to death should be remembered, was not against the British the enemy but against a component of the national struggle, the big dalit movement led by Ambedkar. Under this pressure, Ambedkar succumbed. Perhaps it was the effect not so much of the moral pressure as much as of the fear that at that, were Gandhi to die, the cause of Hindu unity/dalit could be attacked by upper caste Hindu community places.

A British colonialist sought to prolong its stay in India and used every conceivable form of division in Indian society to try and destroy the prospects of unity in the multi-racial people. Until Ambedkar's fast, the movement had largely seen its enemy as only the upper caste Hindu and was sided with the British to oppose the oppression of the caste Hindus.

The Congress, on the other hand, allowed this tactic to be put into successful use to keep the "take up questions of racial oppression in order to strengthen the anti-colonial struggle. As a result, the Congress refused to consider or work on them, the main issues questions along with the national struggle, however national and anti-colonial it was.

In the days of class struggle, a Hindu nationalist like Swami Vivekananda, founder of the Arya Samaj, was not in favour of the notions of superiority/inferiority as being contradictory to the injunctions of the Vedas. Dayanand Saraswati introduced the idea of superiority/inferiority not only to the Hindu community for Gandhi as well as to the British. The British provided no justification for the notion of superiority

or inferiority among the four great divisions of Hindu society: each *varna* was equal to the rest and passages from various texts are interpreted to maintain this position. [Dalton, 1967, 166]

Vivekananda continued the eulogy of caste, comparing it favourably to the European system. "Competition is cruel, cold and heartless... is the law of Europe. Our law is caste... the breaking of competition checking its forces, mitigating its cruelties, smoothing the passage of the human soul through the mystery of life" [quoted in Dalton, 1967, 167]

Gandhi, as is well known, started out as a staunch defender of caste in all its orthodox. He supported prohibitions on inter-dining and inter-marriage as supposedly promoting "self-restraint." He held that caste was a vital institution of Hinduism (Hindu community). "I believe that caste has saved Hinduism from disintegration. But like every other institution it has suffered from excrescences. I consider the four divisions alone to be fundamental, natural and essential. The innumerable subcastes are sometimes a convenience, often a hindrance. The sooner there is fusion the better" [Gandhi, 1936]

JATI AND VARNAS

Later on Gandhi did not continue his defence of dining and marriage restrictions and opposed untouchability. But he was not willing to attack the hereditary division of labour expressed in *varnashramadharma*. Faced with pressure from the rather weak dalit movement, which the British wanted to use to divide the anti-colonial struggle, Gandhi emphasised the distinction between *jati* and *varna* and insisted that caste (viz, *jati*) had nothing to do with religion. "Caste has nothing to do with religion. It is a custom whose origin I do not know and do not need to know for the satisfaction of my spiritual hunger. But I do know that it is harmful both to spiritual and national good. *Varna* and *ashrama* are institutions which have nothing to do with castes. The law of *varna* teaches us that we have each one of us to earn our bread by following

the ancestral calling. It defines not our rights but our duties. It necessarily has reference to callings that are conducive to the welfare of humanity and to no other. It also follows that there is no calling too low and none too high. All are good, lawful and absolutely equal in state" [Gandhi, 1936]

It was in keeping with this notion that "there is no calling too low and none too high" that Gandhi adopted the use of the term, "Harijan" in place of untouchable and such like terms. All along Gandhi insisted that caste (*varna*) was essential to Hinduism. "If caste and *varna* are convertible and if *varna* is an integral part of Hinduism, I do not know how a person who rejects caste, i.e., *varna* can call himself a Hindu" [Gandhi, 1936, 86]

The distinction between *varna* and *jati* has been a subject of much discussion. What is noteworthy is that those who wish to preserve caste (which for a long time has been *jati*) refer to the early period of the existence of castes, of *varna*. Broadly two stages can be identified in the development of caste (class) society in India. In the first stage "the priests, warriors and administrators were entitled to the surplus in the form of taxes and gifts for services rendered" [Sharma, 1987, 179]. This stage could be labelled that of a "tributary system." It was broadly the period of the *varna* system.

From the time of the Gupta empire land grants became increasingly important. Along with the taxes paid to the raja or empire, the local feudals (*samants*) began to get an increasing share of the surplus. "Indian kings made land grants to get the taxes (surplus) collected. In their turn the grantees collected rents from their subject tenant peasants who could be evicted and even subjected to forced labour" [Sharma, 1987, 190]. Besides, subject tenant peasant there were also untouchable agricultural labourers. The artisan and service castes in *jajmani balutedari* relations had defined jobs to perform in return for shares of the agricultural crop.

It was in the early medieval period that the caste system was tightened up [Yadava, 1987, 204]. And untouchability, as a characteristic of the caste system, dates to about the second century AD [Gupta, 1985, 23]. The establishment of the full-fledged caste system coincides with the change from the earlier tribute paying system to the feudal system.

The distinction between *varna* and *jati* has a certain historical importance. But in the contemporary period, it was disingenuous to suggest that it was *varna* that should be retained and not *jati*, because what actually existed was *jati* with all its features of discrimination and untouchability. To ask, as Gandhi did, that

people should follow their traditional callings was to condemn the untouchables and other low castes to a life of servitude

Gandhi's solicitous attitude towards the upper castes is revealed time and again. In the 1924 Vikom Satyagraha against untouchability he asks the leaders "not to overawe the orthodox" [Dalton, 1967, 171]. At the time of the Yeravada fast [Pyarelal, 1932, 197] Gandhi asked Kelappan to call off his fast for opening up the Guruvayur temple in Malabar on the specious ground that "not enough notice had been given" [Pyarelal, 1932, 197]. Gandhi frequently cautioned that "there should be no coercion. We must, by patient toil and self suffering, convert the ignorant and superstitious but never seek to compel them by force" [Pyarelal, 1932, 132]. This "patient toil and self suffering" in the struggle against untouchability did not include a fast unto death, a weapon he was willing to wield against Ambedkar and the demand for separate electorates for the untouchables, but not against the upper castes to demand an end to untouchability. No wonder Ambedkar was compelled to ask, "Why did he not undertake a fast unto death against untouchability?"

AMBEDKAR'S ANTI CASTE PROGRAMME

Ambedkar insisted against Gandhi, that a partial attack on untouchability would not do and that it was the caste system as such which needed to be overthrown. He proposed that Hindu society needed to be reorganised on the basis of the principles of "Liberty Equality and Fraternity", that for this the "sense of religious sanctity behind caste and *varna* must be destroyed and this sanctity can be destroyed only by discarding the divine authority of the *shastras*" [Ambedkar 1936, 86].

As the Hindu scriptures sanctified the caste system, any revolt against this caste system would only be possible after the oppressed (at least) had rejected their condition and oppression as being divinely ordained, the result of *karma*, or whatever. But such a rejection of caste could only be the beginning of a revolt against the caste system, not its end.

Ambedkar did not deny the economic features of the caste system, its division of labourers, as Ambedkar put it. But for him, it was the ideological factor, sanction of the *shastras* that was all important. Presumably, once the ideology had been rejected, the rest, the economic changes in particular, would follow suit. But it was the very experience of continued caste oppression despite conversion to Buddhism that led the Dalit Panthers, obviously influenced by the Naxalite movement, to declare in their 1973 manifesto "To eradicate untouchability, all the land

will have to be redistributed" [Dalit Panthers, 1986, 141].

Ambedkar's anti-caste programme stressed the importance of the low castes getting political power, or a share of it, in order to liberate themselves. "Nobody can remove your grievances as well as you can and you cannot remove them unless you get political power in your hands" [Ambedkar, 1930, 341]. In a change from the earlier pro British attitude of the anti-caste movement, Ambedkar pointed out, "No share of this political power can come to you so long as the British government remains as it is. It is only in a Swaraj Constitution that you stand a chance of getting any political power into your own hands without which you cannot bring salvation to your people".

At the 1930 Round Table Conference Ambedkar explained why the untouchables needed a Swaraj government. "Indeed, so far as we are concerned, the British government has accepted the social arrangements as it found them. Our wrongs have remained as open sores and they have not been righted, although 150 years of British rule have rolled away the reason it [the British government] does not intervene is because it is afraid that its intervention to amend the existing code of social and economic life will give rise to resistance" [Ambedkar 1930, 505].

POONA PACT

This brings us to the crucial Poona Pact. At the Round Table Conference Ambedkar had argued for separate representation and electorates for the Depressed Classes arguing that "although they are included among the Hindus, they in no sense form an integral part of that community. Not only have they a separate existence, but they have also assigned to them a statute [status?] which is invariably different from the status occupied by any other community in India" [Ambedkar 1930 503].

Gandhi objected to separate electorates for the Depressed Classes. The reason for his objection it might seem, was that he did not want to restrict the Depressed Classes to just this measly share of seats but to enable them to stake their claim to "the kingdom of the whole world". What was clear was that there was, with the caste system continuing in existence, no way in which the Depressed Classes could stake their claim to "kingdom of the whole world". It is like present day opponents of reservation asking "Why should the lower castes aspire only to the reserved seats? If they are good enough they can get all the seats".

Gandhi's real objection to separate seats for the Depressed Classes was not that it gave too little to the Depressed Classes

but that it would "destroy Hinduism", as Gandhi stated in his letter to Ramsay MacDonald before beginning the Yeravada fast [Pyarelal, 1932, 111]. Earlier, at the Round Table Conference Gandhi had similarly seemed to argue from the point of view of what was good for the Depressed Classes. "Will untouchables remain untouchables in perpetuity?" [Gandhi, 1931, 297]. And in a manner now familiar from the anti Mandal agitation he said, "It will create a division in Hinduism" (emphasis added) as though the division did not already exist.

What is clear is that Gandhi's aim in opposing the scheme of separate electorates for the Depressed Classes was to further the aim not of the Depressed Classes but of Hinduism, not the religious interests of Hinduism but the political interests of the leadership of the Hindu community. Faced with the challenge from the leadership of the Muslim community and faced with the prospect of a reduction in the seat it could command in the legislatures, the leaders of the Hindu community not just Gandhi but also Mahatma, the leader of the Hindu Mahasabha, reacted with a politics of inclusion—those who had formerly been excluded from the Hindu fold as untouchable, were now sought to be included within the fold with the paternalistic name *harijan*.

Conventional (Hindu upper caste) wisdom has it that Gandhi overcame the British imperial policy of divide and rule by the Yeravada fast. The fast (The *Epic Fast* as it is called in the book by Pyarelal wrote about it) is part of the legacy of the national movement. This conventional wisdom also has it that Ambedkar was a willing tool of the British in implementing their divide and rule policy.

GANDHI OBJECTIVE

It has already been pointed out that the importance of Ambedkar in the context of the anti colonial movement lies precisely in that he clearly articulated the incorporation of the dalit with Swaraj. At the same time he was not without a regard for the political future of the dalits to the tender mercies of the upper caste Hindu leadership of the Congress. What he sought was a measure of political autonomy for dalits within the national movement. Through separate electorates Ambedkar sought to ensure that dalits would be elected by the dalit community. Gandhi, on the other hand, wanted to prevent exactly this measure of autonomy. Agreeing to reservation of a proportion of seats for dalits Gandhi insisted that these dalit representatives would be elected by the entire Hindu community. This would ensure that the upper castes

who dominated the Hindu community would decide on who would be the dalit representatives. But by agreeing to proportionate representation for dalits Gandhi was admitting that there were divisions among Hindus which should have a bearing on the political structure. Though he said about separate electorates that it "will create a division in Hinduism", he was in effect accepting that this division was not being created by the provision of separate electorates. Gandhi's objective clearly was to maintain an upper caste hegemony over the whole Hindu community.

That Ambedkar was not falling prey to British colonialism's 'divide and rule' is shown in that, at the Round Table Conference and elsewhere, he insisted that it was only under a Swaraj government that the Depressed Classes could hope for salvation—of course, on the basis of their own organised strength and by establishing their political autonomy.

So, it was not the British policy of 'divide and rule' that was at issue in Gandhi's Yeravada fast. The question was whether or not dalits were to be allowed a measure of political autonomy. Gandhi's objective was to keep the Hindus united as a political community. United against whom? Not, as conventionally argued, against the British—that was not the issue in the Yeravada fast. The unity of Hindus as a political community was necessary in getting their politically dominant sections (upper caste Hindus, landlords, professionals and, behind them, the important power of the pan-Indian bourgeoisie) a greater weight *vis-a-vis* the other communities, meaning essentially Muslims, in the constitutional set-up leading to 'self-rule'. It was for this reason that Gandhi could unite behind him, at that time, all the organisations and representatives of upper caste Hindus, ranging from Madan Mohan Malaviya of the Hindu Mahasabha to G D Birla. Of course, this is not to imply that these organisations subsequently remained united behind Gandhi—the differences over partition and the assassination of Gandhi are proof that they did not. But in the Poona Pact they were united behind him. And the objective of the Yeravada fast was to force the dalits, under Ambedkar, to accept their position of being subordinated to the politically dominant sections of the Hindu community.

CHINA

Export-Led Market Capitalism

Nigel Harris

Market capitalism and foreign investment are all the rage in China for the moment, for they seem so superior to what went before. But this mood will not last indefinitely.

I

CHINA SHAKES THE WORLD! is still on sale in the foreign language bookshops of the People's Republic. Goodness knows why: it is as relevant to today's China as a Victorian tract. China may be shaking the world but it is rather because of its exploitation, not its suppression, of capitalism.

This year the country has resumed growth, returning to the slipstream of world trade. In the first quarter of 1991, industrial output increased by nearly 14 per cent (compared to the same period of 1990). This, despite government caution, resumes the hectic pace of growth throughout much of the eighties—industrial output, in real terms, grew annually by 15 per cent between 1983 and 1988. Furthermore, there have been excellent harvests in the last two years and, although there were heavy losses because of a lack of storage space, rural incomes in the more fertile areas have grown strongly.

You can almost smell the growth, the electricity of breakneck economic change. Guangdong province, alongside Hong Kong, is as before in the lead, apparently irrepressible, despite all central efforts to curb it. The provincial output grew by over 21 per cent per year between 1983 and 1988, and there was continued rapid growth even in the following two recession years. The long-term trend is dramatic—in the two decades to 1978, the average per capita provincial income of the non-agricultural population increased 0.75 per cent per year; in the decade after, by 7.7 per cent per year.

The heart of the industrial growth is the cities, towns and villages of the twisted mass of waterways that constitute the Pearl River Delta, particularly between Guangzhou and Hong Kong. Some of the localities are nationally famous for the speed of their industrialisation—Shunde, Foshan, Dongguan, with the decade-old brand new boom city of Shenzhen, the Special Economic Zone immediately next to Hong Kong. Rural prosperity and peasant savings have spread factories throughout the countryside. The villages seem to have been entirely rebuilt, with three-storey little palaces for the new rural rich. Some of the construction work spills over into party corruption—in mid-April, it was reported in *China Daily* that 759 party officials had been accused of illegally building private homes, 58 were sentenced on criminal charges and hundreds more sacked. And in the cities and towns, the construction work is even more extensive—it seems as if they are being rebuilt before your eyes with high rise offices, apartments and the customary symbol of status, palatial hotels for overseas Chinese visitors returning in search of roots and with investible funds.

What is the basis for this extraordinary decade of growth? A key factor was the reform of the rich well-watered agriculture of the delta region, increased prices of agricultural produce, restoration of rural markets and the rural industrialisation programme encouraged by the government. A second has been the coincidence of three factors: first, Hong Kong's rising wages along with strict immigration controls, which forced employers to search out new locations for the sort of manufac-

relying on cheap labour; second, the long expansion of the United States economy with a radical dependence upon increasing manufactured imports, and, third, the Chinese government's deliberate encouragement of foreign investment, creating a framework to give some assurance to foreign business that they could manufacture without facing expropriation or predatory taxation. Hong Kong firms scrambled to reach collaboration deals with Chinese corporations, setting up over ten thousand establishments, many of them processing and assembling exports. They began in the Special Economic Zone, but almost simultaneously moved on to other parts of the delta which might not enjoy the same publicly provided incentives, but where labour was even cheaper and local authorities desperate to be hospitable. By 1989, it is estimated that operations in Guangdong province producing for Hong Kong firms employed two and a-half million workers. If we add to this the additional jobs in manufacturing, construction, infrastructure and other services which have been created as the result of this, the province must hold the world record for job creation in the eighties.

The spread of Hong Kong manufacturing has been considerably assisted by the peculiarly decentralised system of government that now operates in the province, and the ferocious competition between local authorities to woo and capture foreign investment. Local government has considerable local taxing power and autonomy, they have used it to improve highways, land clearance and drainage, to build power plants to escape the notoriously erratic supply of power to develop telephone communications, even to build ports, as well as elements of technical infrastructure. Since the competition is so strong, they have bent all efforts to cut the bureaucratic restrictions on foreign investment to speed up the processing of applications and facilitate action (one company maintains it is far quicker now to invest in the delta than in free market Hong Kong).

What do the companies make? It is the usual export processing output—garments (especially knitwear), footwear, toys, luggage, sports bags and equipment, electronic consumer goods, prams, and from time to time, with the famous flexibility of Hong Kong firms to meet quickly any external demand, particular temporary exports for example, latex gloves, plastic-covered bird cages, etc. These firms now produce about a third of the provincial industrial output. Much of it goes to the United States. Thus, while Hong Kong's manufacturing labour force has begun to decline in size, its output of industrial goods has soared.

As in other countries engaged in export-processing, nearly 60 per cent of the labour force is women. Their average age is 26, but more than 50 per cent are under the age of 22. Of the workers 90 per cent are said to be migrants from rural areas—there are possibly two or three million migrants in the delta from outside the province. On the other hand, some 50,000 Hong Kong citizens now work in the delta—managers, technicians, supervisors, buyers. 15,000 vehicles cross the border daily, and about a fifth of Hong Kong's currency is said to circulate in Guangdong.

II

How does this fast moving export led market capitalism fit the rigidities of a state organised economy? The one continually undermines the other, eroding the foundations of state control. Consider the workforce. The settled urban labour force of the fifties was registered and thus entitled to a mass of privileges denied to the rural majority—access to urban schools, state jobs at fixed rates of pay with lifetime security of employment, health insurance, disability and old age pensions, highly subsidised housing, food and clothing rations. Very few were allowed to enter this minority apart from the children of existing members. The registered citizens now constitute about 16 to 17 per cent of the population. From the fifties to the late seventies there was also tight control of migration to the cities and from the seventies the one child family policy was enforced strictly on urban couples. The demographic results can now be seen—the median age of the rural population is 21 and of the urban 26. The results of this complex of measures entailed that whenever the economy expanded, there were likely to be severe shortages of urban labour, with rising wage pressure. In the sixties, this was relieved by the 'worker-peasant' system bringing into the city to do unskilled manual work young rural males for strictly limited periods without including them in the privileges and pay of the registered urban labour force. In the eighties, the problem has been eased by relocating urban manufacturing, or subcontracting it, to rural areas. This is part of the basis for the rapid industrialisation of parts of the countryside—between Shanghai and Nanjing along the Yangtze river in southern Jiangsu, in the area between Tianjin and the Shandong Peninsula, in the Xiamen area of Fujian and, of course, in the Pearl River Delta.

From 1978, the controls on migration have been eased. Nonetheless, foreign businesses, looking for cheap labour for export processing, naturally opted to employ workers who were not entitled to

the privileges of the registered population, whether the locations were in urban or rural areas. Rural workers are not entitled to fixed wages, have few welfare entitlements or subsidies, output prices can be varied, there is a light burden of regulation and taxation (especially where local authorities are competing to offer favours), more land, etc. Local party cadres employ their power to favour enterprises in their districts, to obtain for them cheap sites, supplies, low interest credit, taking a cut for themselves along the way (hence the proliferation of private mansions of party officials).

Nonetheless, the labour force for the Pearl River industrialisation is heavily migrant and therefore, in strict terms, illegal. At least it is now officially acknowledged—as 'floating population'. Some estimates put the number of unregistered people in urban China as high as 50 million (others at one in five of the urban population). There are about 2 million in Shanghai. In the Pearl River Delta, some estimates suggest two thirds of the population of Baoan County (adjacent to the Shenzhen Special Economic Zone) is unregistered, a half in Foshan, and up to 16 per cent in Dongguan. The unregistered must feed themselves from the open market and house themselves privately, only the peasants can officially build private houses, so it is presumed they house the new workers on the peri-

primary of the black market, alongside the official 'white' economy, there exists a growing black—or at least, grey—labour market and a private housing market, the two coming to play an increasingly important role in the overall economy.

III

The four or five coastal enclaves of very high growth—of which the Pearl River Delta is the most dynamic—are not the vast expanse of China proper. The gap between the richer and poorer areas of the country has widened dramatically in the eighties. In the second half of the decade, four of the leading provinces (Guandong, Fujian, Zhejiang and Jiangsu) increased their real output by about 140 per cent, or four times as much as the slowest growing provinces. Nor is anyone apparently adding up the cost of high growth, particularly in the provision of infrastructure (especially high where factories are spread thinly in rural areas). Few seem troubled by the possibly transitory character of export-processing production or concerned to ensure that there is increasing domestic content in the output. The government complains that production is of low technology, and has now demarcated 38 zones for high technology manufacture; there are precious few hi-tech operations in these zones. Not too many people seem to realise that, by definition, export processing employs low technology precisely because it is dependent upon cheap labour. It is undoubtedly valuable in a poor country in turning unskilled rural workers into a semi-skilled industrial labour force, in training managers, supervisors and technicians, especially in the skills of selling in a world market, but it cannot upgrade technically China's output. Indeed, contrary to much opinion in China, foreign investment cannot save the country, only the Chinese can do that.

This is especially important since at the same time as co-operative and private manufacturing is growing, the state sector—employing a third of the industrial labour force—is floundering. In 1990, the profits of state enterprises fell by 58 per cent. At the last National People's Congress, the prime minister reported that a third of the national budget was now devoted to keeping afloat the third of state enterprises which were 'sick' (to use the Indian term) and subsidise urban food supplies. Furthermore, the quality of output was often poor—for example, some say that only a quarter of the 66 million tonnes of steel produced is usable in modern manufacturing. There is great overproduction in certain sectors, especially in heavy industry, the

output merely going to useless stocks.

The old industrial economy, especially in a city like Shanghai, is also now much afflicted by the increasing protectionism of provinces, counties and cities. China's government is now unbelievably decentralised. The centre relinquished the right to raise taxes to key provinces—the provincial government bargains over the size of a fixed annual payment to the centre, and keeps the rest of what it raises. This produces considerable anomalies—Guandong has been favoured so it pays to the centre only ten per cent of the 10 billion yuan it raises, whereas Shanghai parts with three-quarters of its revenue (or 10.5 billion yuan). Yet whatever the payments, the centre has run a growing budget deficit without the means to increase its revenue to cover it. Last year, in the draft Eighth Plan proposals, the centre tried to introduce some central taxes, but the provinces, led by Guandong, defeated it, just as they defeated Beijing's attempt to restrict the growth of rural industry.

China has always been an archipelago of local economies with relatively little interaction between them. Local isolation—and self-sufficiency—has been exaggerated by the failure to invest in adequate inter-provincial and inter-urban transport links. But now the problem of fragmentation is increasingly extreme. There used to be a tendency to restrict inter-provincial trade in raw materials, but now the restrictions are affecting manufactured goods—each province is attempting import substitution, to the severe loss of national manufacturing centres like Shanghai. Beijing has only very weak capacity to control the country now, a weakness compounded by what seems to be a stalemate between the leadership factions.

The provinces are now very powerful, particularly the coastal provinces, the main beneficiaries of the new economic order. They maintain great pressure for continued reform, whatever the conservatives at the centre may think. The government might now decide that it is time to shift favours from Guandong and the south-west to Shanghai and the north-east and has offered a gigantic new development project at Pudong for a new Shanghai (shades of New Bombay!) and a new Shanghai stock exchange. But the other provinces swiftly seized the opportunity—Shenzhen, without central permission, opened its own stock exchange one day before Shanghai, and Guangzhou (capital of Guandong) and a number of other cities announced plans to open exchanges. Shenzhen also proposed that Special Economic Zones should have the right to issue their own currency, to control their foreign trade and have law-

making powers—the centre, however, virtual sovereignty. The more gloomy commentators foresee a time when these centrifugal forces may pull the country apart, much as is occurring in the Soviet Union, with Hong Kong merging in an independent Guandong, Taiwan in Fujian, and Japan and South Korea in the north-east.

For the leadership of the coastal provinces, it seems, the condition of continued rapid growth is expanding reforms, moving increasingly towards a full market economy. Nobody can say it; there must be a facade of hypocrisy, but the war on this issue is already over. Whatever the centre says, Guandong apparently continues regardless as it wishes. Even at the centre it is accepted that a private housing market must emerge, unprofitable plants must be closed, urban unemployment accepted, subsidies ended and food prices freed; some are perhaps even thinking of privatisation. But the leadership moves very slowly, trapped between those who say what happened in June 1989 was due to an excess of reform, and those who argue it was the result of a failure to reform enough.

Meanwhile, in the short term, there are hazards. The United States economy is in recession, and its government threatens China with the removal of trade privileges unless the trade deficit is eliminated. Hong Kong merchants are among the most nimble in the world, so they may find alternative outlets if the worst happens. Competition from garments made in Pakistan is another threat. But at least tourism is back to normal after the great decline of 1989; 27 million people visited China last year. There are great problems in the short-term bunching of debt payments next year.

However, there are still grounds for optimism about the economy. What is less promising is the political scene. Many people speak openly of their hostility to the regime, and some no doubt dream of an end to the monopoly of political power in the hands of the Communist Party. The subjective basis for what happened in June 1989 seems to be intact, and people await the opportunity to return to the same agenda. The central leadership is very old and cannot last indefinitely.

Meanwhile, the fast moving forces of a market economy continually erode the sluggish rigidities of the old order. The reform programme will necessarily bring with it new forms of class struggle and new considerations of what sort of society China is to be. For the moment, market capitalism and foreign investment may be all the rage for they seem so superior to what went before, particularly the insanities of the Cultural Revolution. But that mood will not last indefinitely.

Working of State-Level Manufacturing Public Enterprises

Promise and Performance

T L Sankar
R K Mishra
R Nandagopal

The manufacturing State-level public enterprises are operating in vital areas of the economy. Their efficiency and effective working would strengthen not only their functioning but also the effectiveness of State governments as a whole. However, these enterprises suffer from many infirmities which call for suitable policy and operational reforms not merely at the State level but also at the enterprise level in each State. The structural reforms suggested in the paper could go a long way in helping them turn the corner.

MANUFACTURING enterprises are a very fascinating area to study in the domain of the State level public enterprises (SLPEs). With the direct involvement of the various State governments in the industrialisation process of the country, such enterprises are being set up in increasing numbers by every State. The budget allocations provided for equity support for these enterprises have registered a phenomenal growth. However, their working has become a matter of great concern to policy-makers in view of the non-fulfilment of their objectives to a large extent. An intensive study is required to dissect this phenomenon and to suggest measures for the turn-around of the manufacturing SLPEs. We propose to investigate in this paper the genesis, growth, objectives, investment, financing, physical and financial performance, and problems of these enterprises. The information contained in the paper has been collected from the data base on the SLPEs set up by the Planning Commission and the Ninth Finance Commission at the Institute of Public Enterprise.

GENESIS, GROWTH AND OBJECTIVES

The manufacturing SLPEs have a long history of working to their credit. Even before independence the princely states of Travancore and Mysore had set up rubber, soap and oil factories and encouraged sericulture. The success of this direct intervention encouraged the princely States of Rajaputana, Jammu and Kashmir, Vijayanagaram and Hyderabad to set up more and more of such units. After independence and with the onset of the planned era it became obligatory on the States forming the Indian Union to participate in industrial reformation and restructuring. Many States as a result of this deliberate policy started setting up manufacturing units in the middle of the 1960s. Between 1955 and 1965, 180 manufacturing SLPEs were set up by the various States. The period 1965 to 1980 saw a great spurt in the number of and investment in these enterprises. It was in this period that the base of such units was widely diversified from soaps, detergents, sericulture, paper, mining, cement and sugar

units to light and heavy engineering, steel and scooters. Many such units were set up by the Industrial Development Corporations (IDCs) in Andhra Pradesh, Gujarat, Tamil Nadu, Maharashtra and Haryana to produce steel, paper, scooters and engineering items. It was during this period that the States in the north-east set up manufacturing enterprises to exploit the agro and forest based local resources while States such as Uttar Pradesh and Maharashtra started cement, fertiliser, textiles and sugar units as a part and parcel of their area development programmes. The 1980s were a decade of consolidation for these industries. During this period, manufacturing SLPEs have come up in the area of electronics, drugs and phar-

maceuticals, telecommunications, beverages and computers. The takeover of sick units has also added to the portfolio of PEs in this decade as many State governments decided on socio-economic grounds on the acquisition of such units from the private sector. These units mostly include textile, tea, chemical and engineering enterprises taken over by the West Bengal, Maharashtra, Gujarat, Kerala and Tamil Nadu State governments.

The number of these enterprises differ from State to State. Table 1 shows that the first three places went to Kerala, West Bengal and Karnataka which had 47, 24 and 21 manufacturing SLPEs, respectively. Assam, Gujarat, Maharashtra, Rajasthan, Tamil

Nadu and Uttar Pradesh followed with 19, 17, 16, 15 and 14 enterprises, respectively. These States took upon themselves the 'entrepreneurial role' more enthusiastically than the other States. The need for filling up the entrepreneurial void was self-evident in the case of some States such as West Bengal and Kerala, where private sector has remained shy in venturing to set up manufacturing units. It is very important to note that out of 754 SLPEs in the country in the manufacturing, trading and service, finance, promotional and welfare sectors, manufacturing SLPEs topped the list with 250 enterprises, followed by 236 promotional, 121 trading and service, 93 welfare and 54 finance SLPEs. Table 1 shows that engineering and electronics enterprises dominated the overall manufacturing SLPEs scene in the country.

The objectives of the SLPEs vary from State to State. The objectives have also undergone changes over a period of time. However, the broad objectives of these enterprises are aimed at (i) filling up the entrepreneurial gap caused by the private sector in the various States; (ii) undertaking capital-intensive and risk-prone industrial activity; (iii) supplementing and supplanting the efforts of the private sector in the industrial development of the States; (iv) exploiting technological advantage in favour of States in areas of high-tech base; (v) operating monopoly business in the state sector; and (vi) generating surplus for the planned development of the states and for their own growth.

INVESTMENT AND FINANCING

As on March 31, 1987, 250 manufacturing SLPEs had an investment of about Rs 3,837 crore. Table 2 shows that the investment in these enterprises more than doubled during the six-year span of the study. Excepting West Bengal and Uttar Pradesh, the investment in other States has shown higher-than-average growth.

The ground rule for the investment pattern in manufacturing enterprises initially specified by the Central government and subsequently followed by State governments is a debt-equity mix of 1:1. This is based on the consideration that such enterprises entail huge capital investments, longer gestation period, stable turnover and rapid obsolescence of technology. There have been variations in this ground rule insofar as fertiliser and paper units are concerned as they require capital in mega proportions. Finance theories point out that these enterprises need to follow the source-cum-stage-based approach under which the financing is linked to the stage of operation of an enterprise. In the gestation period, these enterprises should be financed by equity. In operation, they should be financed by debt. In expansionary phase, these enterprises should be financed by part debt and part equity as, on the one hand, the ongoing activities would be in their normal run and the erection and construction would take place for expansion,

on the other. Once the releases of funds are negotiated the flow should be as per schedule. Tables 2 and 3 give the data on investment and financing of these enterprises.

It may be observed from Table 2 that Karnataka, Andhra Pradesh and Uttar Pradesh shared the top three places in terms of investment in the manufacturing SLPEs. It is worth noting in this context that huge investment in a couple of enterprises gave them this honour. In the case of Karnataka, the investment in Mysore Paper Mills and Visveswaraya Iron and Steel amounted to Rs 230 crore and Rs 165 crore respectively. The Singareni Collieries Company in Andhra Pradesh had an investment of Rs 440 crore. In Uttar Pradesh, the investment in its Sugar Corporation turned out to be Rs 247 crore. We may mention here that the top five manufacturing SLPEs in terms of investment in the country included Singareni Collieries Company, UP State Sugar Corporation, Tamilnadu Newsprint and Papers, Mysore Paper Mills, and Durgapur Projects (Rs 187 crore). The investment in these enterprises worked out to nearly 40 per cent of the total investment in the manufacturing SLPEs in 1986-87.

Table 3 shows that the debt-equity ratio in different States varies very widely. But generally within the States the debt-equity ratio followed a steady pattern over the years. When the enterprises in the manufacturing sector do well financially, they would be in a position to raise institutional finances and tap other budgetary sources and increase the debt component. The presence of a higher debt-equity ratio in Andhra Pradesh, Karnataka, Gujarat and Maharashtra could

be ascribed to these reasons. In fact, some of the large SLPEs like Singareni Collieries and Hyderabad Allwyn in Andhra Pradesh have obtained external debt assistance in large measure. However, in the case of West Bengal the increasing debt-equity ratio appears to reflect more the tendency to capitalise the accumulated losses as debt in the organisations. It is worth noting that lack of proper policy towards the financial structuring of the organisation in different States is a matter of serious concern. On the whole, for all the enterprises taken together equity fell short of the 1:1 norm in States such as Andhra Pradesh, Rajasthan, Assam, Orissa, Haryana, Punjab, Tamil Nadu, Karnataka, Kerala, Madhya Pradesh and Maharashtra. This constituted a departure from the well established practices of designing the capital structure as it failed to provide the financial incentive to undertakings to earn profits. When more than half of the enterprises were either incurring cash losses or had receding net worth, it was inappropriate for these enterprises to have an excessively high debt-equity ratio. The financing practices in the enterprises under reference reveal a couple of interesting dimensions. These enterprises had depended, by and large, on the State governments for both debt and equity support. The financing through current credit formed a very negligible proportion (say, less than 10 per cent). Only in the case of a few enterprises fixed deposits were invited from public. The foreign participation in the equity capital similarly was limited to some hi-tech enterprises such as Hyderabad Allwyn, Mandya Paper Mills, Tamilnadu Newsprint and

Papers and New Government Electric Factory. Again, some of these enterprises which earlier belonged to private entrepreneurs had preference share capital which constituted a very small proportion of their share capital. Since most of these enterprises were financially not viable, even the debt funds had to come only from the State governments. The manufacturing SLPEs in the north-east were exceptions as the Central government funded the debt component of these enterprises largely.

PHYSICAL AND FINANCIAL PERFORMANCE

The turnover to investment ratio, the capacity utilisation, product rejection rate and project implementation schedules could be some indicators helpful in measuring the physical performance of the manufacturing SLPEs. However, it has not been possible to collect systematically information on them.

The capacity utilisation was low by all standards. It fluctuated between 25 and 50 per cent in most of the States. The reasons adduced for low capacity utilisation include lack of balancing facilities, inept site selection, energy shortages, sub-standard plant and equipment, transport bottlenecks, inadequate technical personnel, lack of infrastructure, market failures, demotivated personnel, absence of an appropriate mechanism to enforce a strong marketing drive, failure of market and lack of vision regarding diversification on the part of the top management of these enterprises.

It is difficult to fix the optimal rate of return for the manufacturing SLPEs as the products manufactured by these enterprises cover a wide spectrum of goods from consumer durables to electrical equipment, and engineering goods to consumer products like soaps, detergents, textiles. In the private sector, the average rate of return of these industries varies widely as the risks involved in each sub-category of industry is different. For example, electrical industries which tend to be highly profitable are associated with high risk of their turning out to be loss-making if they do not upgrade the technology or keep their market prices competitive. The cement, sugar, textiles industries have a low profitability but have less risk and greater possibility of consistent performance. A study of the profitability of manufacturing enterprises in the public sector proves that such expectations are real. There are units with highly profitable potential and there are many more with very low profitability. This is not surprising as many of the SLPEs in the manufacturing sector were originally profit-making industries which became sick and were taken over as sick industries.

Secondly, some of the SLPEs under the manufacturing category started off with congenial disabilities as they were located in inappropriate places and were provided with technologies which were outdated. Some were supplied with sizes which are sub-optimal. Furthermore, in this sector, there

are a number of enterprises which have not gone into full production and overcome their initial teething problems. Given these variations, it would be improper to suggest a rate of return on the basis of observed situations. It appears proper to suggest the optimal rate of return that one sees in the private sector. Normally in various price fixations by the Bureau of Industrial Costs and Prices, the rate of return is taken as 12 to 15 per cent on the net assets. Taking this one would accept that the current rate of return for long-term loans would be about 12 per cent. It follows from the above that the minimum rate of return could be fixed at 12 per cent before payment of interest and taxes. It is worth noting that the central public enterprises as a whole are able to show a rate of return on capital employed of a little over

12 per cent consistently from 1960.

The financial performance of these enterprises has become very critical in view of the budgetary deficits of the State governments. These enterprises have been called upon to contribute their might to filling the kitty of the State governments. They also need to mobilise finances for their own growth. Table 4 gives the data on the financial performance of these enterprises. We have taken the profit before interest and taxes (PBIT) to investment as the indicator of financial performance.

The rate of return in the manufacturing SLPEs in each State is given in Table 4 for the years 1981-82 to 1986-87. The table indicates that the performance of the SLPEs in the manufacturing sectors for, reasons which we have set out already, is uniform

neither within the State nor as between States. Within each State the performance fluctuates very widely in different years, may be due to one or two major manufacturing industries performing very well or very badly in particular years and their performance over-shadowing the performance of other units.

In Goa, the manufacturing industry being only one, the performance was positive for all the years and increasing steadily. In Madhya Pradesh it was positive at a modest level of 5.41 per cent. Moreover, it was far below the target of 12 per cent which was assumed as a reasonable rate of return for the State. In certain States this average of 12 per cent was reached in particular years but was not kept up, e.g. Rajasthan. But it is depressing to note that the manufacturing SLPEs' performance was very bad in some years in certain States such as Bihar, UP and West Bengal. The average for all the SLPEs in the manufacturing sector for the country as a whole was far below 12 per cent varying from (-) 0.5 per cent to (+) 3.9 per cent during the various years of the study. The reasons for this need an in-depth analysis, but it would appear that while the State governments took entrepreneurial decisions to set up manufacturing industries to go by their productive capability, their capability to implement such decisions was poor and they had only achieved in getting a lot of manufacturing industries which had not performed, as well as similar industries in non-government sectors.

It is evident from the study that the manufacturing SLPEs did not pay any heed to business prudence and commercial working. The working capital in these enterprises exceed 6 to 8 months' requirements of production and turnover which hints at the poor cash management in these enterprises. The accumulated deficits to paid-up capital ratio points out that in most of the States the situation had crossed the danger mark. Excepting some mining and mineral enterprises in Rajasthan, Madhya Pradesh and Maharashtra and a couple of enterprises in the electronics and telecommunication sectors in some States, viz. Uttar Pradesh, Kerala and Gujarat, most of the enterprises had wiped out their paid-up capital. The profitability in many cases was discouraging even at the gross margin levels. The optimal rate of return for these enterprises is 12 per cent per annum on their investment. Table 4 shows that the rate of return before interest and taxes in the manufacturing SLPEs averaged 1.74 per cent during the period 1981-82 to 1986-87. In the SLPEs in Goa the best average rate of return was 25.31 per cent which was well above the optimal rate of return. This shows that there was tremendous scope for the SLPEs to boost their profitability. This is supported by the fact that the overall rate of return for all the manufacturing SLPEs during the period 1981-82 to 1986-87 never exceeded 4 per cent.

The categorisation of manufacturing SLPEs as profit-making, mixed perfor-

mance and continuously loss-making enterprises shows that out of 250 such enterprises, 33 earned profits continuously, 80 had given mixed performance (i.e. their financial position changed from profit to loss and vice versa), and 137 incurred losses without fail. The continuously profit-making enterprises included Hyderabad Allwyn, New Government Electricity Factory, Gujarat Communications Systems, and few enterprises from the Keltron and Uptron groups. These enterprises operated in competitive and hi-tech fields. They had a great amount of clarity about their corporate mission and objectives. The mixed performance enterprises were operating in the field of textiles, minerals, sugar and steels. The fluctuation in the demand of their products and changes in the policies of the controlling State governments influenced their financial results from one of profit to losses and vice versa. For example, the textile mills which made losses as taken-over units started turning the corner in the closing years of the study due to boom in the textiles market. Similarly, the enterprises in minerals sector earned profits or incurred losses depending upon the prices negotiated for export orders. The continuously losing enterprises included jute mills, engineering firms and chemical units. The top five chronic losers in 1986-87 included Visveswaraya Iron and Steel (Rs 139 crore), UP State Sugar Corporations (Rs 122 crore), Durgapur Projects (Rs 62 crore), Kerala Minerals and Metals (Rs 45 crore), and Durgapur Chemicals (Rs 43 crore).

Table 5, besides depicting the manufacturing SLPEs in the three categories men-

tioned earlier, shows the percentage of accumulated losses to capital invested in these enterprises across the various States. The losses were as high as 656 per cent in Himachal Pradesh (the major culprit being Mahan Foundry), 240 per cent in Kerala, 240 per cent in Tripura (the jute mills being the major irritant) and 201 per cent in West Bengal. Table 5 clearly points out that the topmost priority needs to be given to the turn-around of the loss making enterprises. Such of these enterprises which could not be turned-around should be closed down at the first opportunity. To consolidate the gains further, efforts should be initiated to shift the mixed performance enterprises to the category of profit-making enterprises through appropriate short- and long-term reforms. These may include measures ranging from the introduction of the Memorandum of Understanding to the stabilisation of output plans.

PROBLEMS

All these enterprises had pre-natal and post-natal problems. Their pre-natal problems mainly related to project management. In many cases site selection itself emerged as the major problem. In certain other cases wrong demand analysis turned out to be the key contributory factor to losses. Defective plant and machinery hindered the working of many enterprises. In some cases the selection of inappropriate technology constituted the main limitation. Time and cost overruns as evidenced by sums tied up in their capital works-in-progress were frequent. The case of

Karnataka Soaps and Detergents, formed in 1980 to takeover the departmental units at a consideration of Rs 27.07 crore corroborates this analysis. Due to delay in taking a decision about implementation of expansion project, there was a cost overrun of Rs 5.08 crore, representing about 100 per cent of the initial estimated cost, including Rs 3.42 crore (56.25 per cent) towards increase in the cost of plant and machinery, although there was no significant change in the scope of the capabilities of various equipment. After commissioning of the soap expansion project in 1984-85 at a cost of Rs 17.28 crore (up to 1983-84) raising the installed capacity to 26,000 tonnes per annum, the actual production was only 25.2 per cent in 1984-85 and 37.4 per cent in 1985-86. Shortfall in utilisation of installed capacity was partly due to non commissioning of soap drying and finishing lines for translucent soap and marbled soap. In view of marketing constraints and severe competition, the company could achieve production to the extent of 42 to 83 per cent of the targets during the five years up to 1985-86. The production in detergent plant commissioned in 1976 which was restricted to match the off take in the market ranged from 18.3 per cent to 74.6 per cent during the five years up to 1985-86. Further, as noted earlier, many of the taken over sick units could not be turned around and consequently they kept on adding to the losses of SLPEs in the sector under reference.

The post natal problems revolved around the operational deficiencies in these enterprises which included lack of systems and procedures with regard to the purchase and upkeep of materials, recruitment, promotion and motivation of personnel, formulation of suitable credit collection and cash management policies and choice of appropriate product mix. The marketing function was not accorded a suitable status in these enterprises. As a matter of fact, marketing had all the attributes of selling and continued to lack the elements of dynamism in toto. These enterprises also weathered storms on the interface relationship with the State and Central governments, suppliers and consumers. They were subjected to rigorous public scrutiny. Further, they did not do much to transform their supervisory and managerial personnel through training and management development. The management information systems in these enterprises did not take into account the internal and external requirements. Under these circumstances it is not surprising to note that strategic management and corporate planning remained merely pious hopes. These enterprises never looked back to their profiles of activities which in many cases resulted in them adding on innumerable but little useful work.

CONCLUSION

The manufacturing SLPEs are operating in vital areas of the economy. Their efficiency and effective working would strengthen

not only their functioning but also the effectiveness of State governments as a whole. However, these enterprises suffer from many infirmities which could be rectified by suitable policy and operational reforms not

merely at the State level but also at the enterprise level in each State. The structural reforms suggested in the paper are expected to go a long way in helping them turning the corner.

Poverty and Income Distribution

Edited by

K S Krishnaswamy

While there has been over the years a perceptible increase in per capita income and expenditure and possibly some decline in the incidence of poverty in India, what still remains is massive and of a kind that is not remedied quickly or smoothly. Even with radical policies, the shifts in income and occupational structures to make a serious dent on it will take more than the rest of this century. In the welter of recent exchanges between the government and the opposition as well as between planners and market advocates on the strategy of growth, these issues have been largely obfuscated. It is therefore more than ever necessary today to recognise the magnitude of the problem and the inadequacy of the measures adopted so far to deal with it.

Lopsided Growth

Political Economy of Indian Development

by Pradhan H Prasad

This collection of essays in political economy unravels the forces which have acted as a drag on Indian development. The Achilles heel of Indian development plans, the author argues, has been their preoccupation with investment planning to the neglect of institutional transformation. Within this broad framework the author discusses a wide range of subjects including macro economic plan models, choice of techniques, the persistence of outmoded production relations in agriculture, growing political assertion by the middle peasantry, roots of agrarian violence and uneven regional growth.

How Competitive Is BHEL?

Rajiv Lochan

There are several factors which must be taken into account while considering the competitiveness of an industrial product, such as for instance the existing market conditions for the product, the quality of the equipment and its performance in service. In the field of power generation the products of the public sector Bharat Heavy Electricals (BHEL) compete with equipment from international manufacturers. How do they fare in terms of price, quality and performance?

COMPETITIVENESS is a relative concept. A firm's competitiveness cannot be judged in certain products without a proper understanding of the operations of its rival firms as well. To put it differently, we have to understand the rules of the game of the market for those products. Hence in the first part of this article we discuss the nature of the market for heavy electrical equipment. In the second section we show that BHEL's products are competitive in both price terms and in terms of technical parameters. In the third section we compare the performance of equipment supplied by BHEL to that of imported equipment in India.

I

Nature of Market

The salient features of the market for heavy electrical equipment may be described as follows:

- (i) A customer's decision to buy a particular piece of equipment not only depends on its price and quality but also on the suitability of the equipment for his system, the experience that the manufacturers of the heavy electrical equipment have on similar work and the relation between the customer and the manufacturers.¹
- (ii) Every customer has his own rationale for evaluating a tender.
- (iii) The price of a heavy electrical equipment "in fact is a package which includes many non price elements such as speed of delivery, credit terms, ease of ordering and quality of after sales service".²
- (iv) There is no continuous price information available for heavy electrical equipment in trade journals.³

(v) Any comparison of price is "true only for the product at the time of the purchase in the country under the set of conditions".⁴

(vi) There is a large excess capacity in the world and many of the firms follow marginal cost pricing strategy.⁵

From the above it is clear that if we want to discuss the competitiveness of BHEL's products we have to analyse the global tender so that we can (i) first compare the technical parameters of BHEL's products *vis a vis* its competitors and (ii) the price quoted by BHEL and its competitors. It should also be noted that since many firms the world over follow marginal cost pricing strategy they would not be making profit in the product at the price they quote in global tenders. So even if BHEL makes losses at the price it quotes in the global tender, it could still be competitive. We will show in Table 1 that BHEL has either made profit or very small loss at the competitive price. Finally, to judge BHEL's competitiveness it is necessary to compare BHEL's equipment with imported one.

II

Competitiveness of BHEL's Products

We will examine this question in the case of two major products of BHEL—210 MW

turbo generator (TG) sets and 210 MW boiler. We divide this section in two parts: (a) analysis of Singrauli and Korha tenders. Here we compare the price and the technical parameters of the product of BHEL with that of competing firms and (b) analysis of cost data of Tarakka project (BHEL won all these tenders—original documents even in the appendices).

ANALYSIS OF SINGRAULI AND KORHA TENDERS

For Singrauli project there were only two companies—BHEL (India) and Fuji (Japan) participating in the tender for 210 MW boiler. While Fuji quoted Rs 52.90 crore, BHEL quoted only Rs 37.46 crore. Thus BHEL quoted a price which was 15% less than the price quoted by the only competitor or by Rs 15.4 crore. In the case of the 210 MW TG package in the same Singrauli tender while Hitachi quoted Rs 35.8 crore, Toshiba Rs 37.43 crore, Fuji Rs 29.09 crore, BHEL quoted only Rs 30.56 crore. Here also BHEL did not use the 15 per cent price preference available to the domestic products in IDA tender. If BHEL had utilised this 15 per cent price preference they would have quoted Rs 33.4 crore (i.e. the lowest price quoted in the tender—Rs 29.09 crore plus 15 per cent price preference). It is not clear why BHEL quoted such low price for both boiler and TG sets because of its technical specifications.

TABLE 2

(In Crores)

|--|--------------|---------------|---------------|---------------------------------|
| Average daily energy generation by 13 sets | 1,81 | 37.43 | 35.33 | 36.47 |

TABLE 1

| Steam Generator Package | | 210 MW TG Package | | | |
|---------------------------------|-------|-------------------|--------|--------|---------|
| | BHEL | Fuji | BHEL | Fuji | Hitachi |
| Efficiency at 100 per cent load | 87.49 | 88.9 | 2024.3 | 2037 | 2030 |
| 80 per cent load | 88.02 | 89.1 | 2055.5 | 2060 | 2078 |
| Output | 700 | 700 | 2139.9 | 2043.5 | 2064 |
| Commencement of total operation | | | | | |
| Unit I | 157 | 156 | 154 | 170 | 157 |
| Unit II | 183 | 182 | 180 | 196 | 183 |
| Unit III | 209 | 209 | 205 | 222 | 209 |

For the Singrauli tender, see Appendix I

tions are concerned BHEL's products appear to be as good as that of other firms. This is clear from Table I. It is clear that BHEL's boiler is technically as good as that of Mitjui. In the 210 MW TG package also BHEL's sets are comparable to the other sets.

In the tender for Korba which BHEL won, it was the only firm participating in the tender for boilers. For 210 MW TG set ANSALDO was the only competitor. While ANSALDO quoted Rs 60.815 crore, BHEL quoted only Rs 39.42 crore. Thus here also BHEL quoted a price, much lower than that of the competitor (the Korba tender is attached, Appendix II).

For the Singrauli project, BHEL is supposed to have made a loss of Rs 25 crore.⁷ That is, while they quoted Rs 67.9 crore for the turbogenerator-boiler package, their cost was Rs 92.9 crore. (Though it should be noted that loss would have been more had they not got export incentives from the government which they get in IDA tenders. On the other hand duty drawback which they got is less than the customs duty that they pay.) If they had quoted a price 15 per cent in addition to the lowest price quoted by any competitor they would have then quoted Rs 94.14 crore. In that case they would have made a profit. Thus they can make profit even when they quote a price which is just 15 per cent higher than the lowest price quoted in the global tender. This shows that they are competitive.

ANALYSIS OF COST DATA

We have the cost data on the Farakka project which BHEL won in global tender (Appendix III). BHEL made a loss of Rs 5.85 crore on the 210 MW TG set and a profit of Rs 1.71 crore on the 210 MW boilers though it is true that without export incentive, the loss would have been greater. They got Rs 34.1 crore as export incentive for the TG sets and Rs 2.69 crore as export incentive for boilers. However, on the other hand the duty drawbacks that they got is less than the customs duty that they paid. For example, for the turbogenerator they did not get any duty drawback, while in the case of boilers they got duty drawback of only Rs 1.13 crore, i.e., only 6.92 per cent of the price of the direct material, including duty. We know from the study of BHEL done by CEI,⁸ that the customs duty paid by BHEL on the raw material for the 210 MW TG set was 17.08 per cent of the value of raw materials including duty. And this was so in the case of 210 MW boilers as well. Now if we exclude the export incentive in the case of 210 MW TG set for the Farakka project and include 17.08 per cent of the value of direct materials consumed as duty drawback, the loss would be Rs (-)7.04 crore. In the case of the 210 MW boilers if we allow duty drawback at the rate of 17.08 per cent of the value of direct material and exclude export incentive, the profit will be Rs 68.20 lakh. Thus if BHEL gets raw materials at international prices, then even without an export

subsidy BHEL will be making profit in boilers (though marginal) and a loss of Rs (-)7.04 crore in the case of the turbogenerator in Farakka project. Given this, it can certainly be concluded that BHEL can make a profit in the case of the 210 MW boilers at competitive price.⁹ Even in the case of 210 MW TG set, it can be argued in the light of Singrauli and Korba tender that BHEL might be making losses because it quoted too low a price.

III

Quality of Power Equipment Supplied by BHEL

In this section we will discuss the quality of power equipment supplied by BHEL, and also try to find out how BHEL's products compare with imported equipment.

A number of State Electricity Board (SEB) officials informed the Estimate Committee (1980-81) that power equipment supplied by domestic manufacturers had not performed satisfactorily and they felt that this was "the main factor contributing to the poor performance of power stations in the country".¹⁰ An expert on power stated that

ine sets that BHEL had supplied had many design/manufacturing defects. This resulted in poor availability as well as output of these sets.¹¹ Thirty two design manufacturing defects were identified in the sets supplied by BHEL, by a SEB BHEL and their collaborators were supposed to have accepted these defects. Another SEB complained to the committee that "94.38 per cent of the operational hours lost in a power unit were attributable to equipment failure, design defect and deficiencies. The percentage in respect of the other unit was 85.23 and 87.28".

BHEL conceded the point but attributed it to lack of experience. The chairman, BHEL, stated before the Estimate Committee on January 9, 1981 that the first 200 MW set supplied by BHEL was commissioned only in December 1977 and it started working only in May 1978. Thus the oldest 200 MW set supplied by BHEL was not more than three years old. Thirteen sets were working out of which some had come only a year ago. The chairman, BHEL, asked "unless the sets run how can you put things right?" BHEL informed the Estimate Committee in March 1981 that they had rectified the 'initially identified' design defects in eight out of 13 sets which had been commissioned up to March 31, 1980 and promised that the rest of the sets would be rectified during plant shut downs. BHEL further stated in the note that the performance of the sets which have been rectified 'has been quite satisfactory', giving data as in Table 2.

BHEL also maintained that they would utilise this experience to modify the subsequent sets manufactured by them at the manufacturing/erection stages so that similar problems did not arise in future. They hoped that 'all sets which would be commissioned from 1981-82 onwards would not have these teething problems'.¹²

A comparison of power equipment supplied by BHEL and imported equipment working in similar conditions can give an indication of the quality of BHEL's equipment. In this regard CMD BHEL stated:

In the IP unit in Delhi the imported units are one of 35 MW, and three units of 61.5 MW. There is only one BHEL unit. In 1979-80 operating availability of imported unit was 81 and that of BHEL 85. In 1980-81 the imported unit availability was 71 and BHEL's 94. The plant load factor in 1979-80 of imported unit was 71 and BHEL's 72. In 1980-81, that of imported unit was 79 and BHEL's 72. At Harduaganj there was one item of imported equipment 2x50 MW and two of BHEL's 2x60 MW and 1x60 MW that is three units. In 1979-80 the operating availability of the imported unit was 46, ours was 62. In 1980-81 it was 36 for the imported units and 68 for our units. In 1980-81 their plant load factor was 26 and ours was 45. Thus at Obera for the five units of 50 MW each imported from the Soviet Union we had corresponding three units of 100 MW. The operating availability in 1979-80 was 52 for the imported units and 86 for our units, in 1980-81 it was 63 for the imported units and 70 for BHEL's units. Their plant load factor

in 1979-80 was 44 and ours was 60; in 1980-81 for the imported units, it was 45 and for ours it was 40—of course, this needs to be examined.

He also stated that "by and large BHEL units, by all accounts were better".¹³

It might be that BHEL's assessment is biased, so we quote from the Rajyadhyaksha Committee Report. Comparing indigenous equipment with the imported equipment the report says, "it would appear that the indigenous sets have a lower availability on the whole than the imported ones. This may partly be due to the fact that the indigenous sets have come in relatively recently and are taking more time than anticipated to settle down. No general statement can, however, be made that all imported sets perform better than indigenous ones and some, in fact do significantly worse. There is, however, sufficient data to suggest that the better imported sets currently show superior performance to the indigenous sets even after the stabilisation period of the latter is over. The performance gap, however, appears to be narrowing with the more recently supplied indigenous 200 MW sets although they too still have to settle down".¹⁴ That the main problem earlier was lack of experience is further supported by the fact that now BHEL's sets are working much better. The *Annual Report of BHEL 1986-87* says 'BHEL sets achieved plant load factor of 53.5 per cent against the national average of plant load factor of 53.2 per cent for the year. While 200-210 MW sets which constitute the backbone of power generation in India achieved a PLF of 58 per cent, the norm set by Rajyadhyaksha Committee. 500 MW sets recorded a PLF of 75.9 per cent. The performance of 60/110 MW, however, needs improvement for which modernisation programmes have been drawn up' (pp 4-5).

Thus it would appear that BHEL has been competitive in international competitive bidding but it has been facing losses because it has been quoting too low prices. The quality of BHEL's products are not necessarily worse than that of the imported equipment and the quality of BHEL's equipment in terms of plant load factor has improved.

Electricity tariffs in Karnataka

V Ranganathan

The recent hike in power tariff in Karnataka has evoked unprecedented protest from consumer groups in the State. Among the criticisms levelled are the inefficiency of the Karnataka State Electricity Board, which has been attributed to the absence of competition from the private sector, and the subsidy to farmers. The paper attempts a proper scrutiny of the various factors underlying the tariff revision.

THE recent hike in power tariff has set off unprecedented opposition from many consumer groups. Their objections broadly:—The need for a hike in a year when hydro reservoirs are full and high cost import from Maharashtra may not be needed.

—KEB may be making a loss, but government is mobilising resources from power sector through Electricity Tax, water royalty and interest on loans (all the three amounting to Rs 166 crore). Stated differently, this means, KEB should not be viewed in isolation or partially, the power sector as a whole, taking KEB, KPC and government should be considered.

—Why should consumers pay for the inefficiency of the KEB: their T and D losses are high at 22 per cent; it is overstaffed (compared to Tamil Nadu and Andhra Pradesh); why free electricity to them etc.

—Why should consumers pay for the farmers who get electricity at throwaway prices? Let the government directly subsidise them.

—Cost of generation is only 37 paise per unit. (Critics have mistakenly compared the revised tariff with the cost of generation, whereas the proper comparison should be with the weighted average cost of power after considering imports, and the additional costs including losses to bring the power up to the respective user points.)

They have also objected to the 'removal' of EHT rebate and power factor incentive and have also asked for rebate on night use of power. They have gone as far as to suggest that they will not pay at the revised rates. Some have felt that the present plight is because of the KEB's monopoly and that competition from private sector will redeem the situation. All this calls for a proper scrutiny of the revision in tariff.

The board (KEB) appoints a Tariff Committee and the *Tariff Committee Report* is supposed to be considered by the board of KEB for arriving at a decision on revised tariff. This is as it should be, for this is what is enshrined in the Electricity Supply Act—that the within-state tariff is in the domain of the state electricity board (SEB). But in practice this is seldom followed and the tariff is indeed decided by the government. No chairman of any SEB has at any time raised this issue of autonomy in tariff making, and thus the practice has been going on unchallenged, with the *quid-pro-quo* that the management is also not responsible for the financial performance of the board. In fact chairmen of KEB have the dubious distinction of being allowed to have a say in tariff

making, only after their retirement. In what follows, we will analyse both the tariffs recommended by the Tariff Committee and the one adopted by the board/government and meet the objections raised by user groups.

First of all one must be clear as to whether tariff making should be done by the electricity board, as per the Electricity Supply Act, or by the government as is the practice. For this has implications. When the SEB sets the tariff, the supply act enjoins it to price power in such a way to earn a surplus of at least 3 per cent of the value of fixed assets of the board. (Remember that with the new invitation to private sector into power sector, they can earn 15 per cent.) In this case, what matters is only the profitability to the SEB, and not the resource mobilised by the State through tax, royalty etc. In other words, a so-called partial analysis, from the narrow point of view of KEB is valid, never mind if KPC makes supernormal profits. But then the tariff making power for KEB must be understood in the broader context of financial and operational autonomy to the board, where it can, to some extent, dictate the price to KPC as a monopsonistic buyer; it can claim subsidy from government for fulfilling any social objective that the government may want of it, eg Bagayathi Schemes or subsidy in agricultural tariff.

If on the contrary we agree for government to set the tariff, then two things follow: (1) The SEB is not obliged to run on commercial lines. The requirement of Electricity Supply Act of earning at least 3 per cent surplus cannot be insisted upon. (2) The existence of multiple objectives, and subsidy become legitimate. It becomes similar to the postal department. Then the consumers cannot complain of cross subsidy to the farmers, just as the consumers of Re 1 postal envelopes cannot complain that they are forced to subsidise the consumers of Re 0.15 post cards. This is because government has the right to meet the redistribution objective, and it can very well choose electricity as one of the instruments of achieving this objective. It is normally in this context that agriculture sector and weaker sections are cross subsidised by the government, and when government sets the tariff it hardly matters whether it takes recourse to cross subsidy or subsidises the board explicitly, because in this scheme the electricity board is really part of government.

The Tariff Committee has not resolved this dilemma, viz, whose point of view, KEB's or government's it has to take. To

illustrate, a major term of reference has been to evolve a tariff structure to earn a surplus of 3 per cent at least. Interestingly, cross-subsidy to agriculture has *not* been one of the terms of reference, and yet for IP sets it has recommended an average realisation of only 45 paise per unit against its own calculated cost of 119 paise per unit. Subconsciously the Tariff Committee has reckoned that subsidy to agriculture is there to stay, and the increase can only be marginal, and the quantum of increase has nothing to do with objective figures. That the cost figure for agriculture itself is at best a guess is another matter, to which we shall revert later.

Against the mandate of the terms of reference and Electricity Supply Act of setting tariff to earn *at least* 3 per cent surplus, the Tariff Committee has focused on the word *at least* and has recommended tariffs that proposed to earn the board a surplus of 11.9 per cent in the first two years and 6.5 per cent in the third year. Was it over enthusiastic? The committee sought to justify saying that the extra surplus would go towards wiping out the accumulated loss of KEB, which on March 1990 stands at Rs 326 crore.

There is another dilemma when it comes to power tariffs, viz, whether to price at average cost (plus a rate of return) or marginal cost. Average cost is the total operation and maintenance cost along with depreciation and interest divided by the total energy produced. Marginal cost is the cost incurred to produce one extra unit of energy. Since one is not going to add capital equipment to produce just one unit of output, in practice, the marginal cost is accepted to be redefined as the average incremental cost. Practically speaking, the average cost pricing passes on the benefits or disbenefits of the past to the consumers, but does not give an accurate signal as to the relative scarcity of the product in future. It also ensures that the financial target of the enterprise is met. Marginal cost pricing on the other hand gives an accurate signal about the value of the product and its relative scarcity and therefore aids the users as to how to efficiently use it. However, it does not give any clue to profitability of the producing utility, since it is a method of pricing all the units of output with the cost of producing the last unit of output. In the electric utilities in the west, the marginal cost was less than the average cost in the initial years for thermal plants, due to economies of scale in unit size of plants and technological improvement

...to other heat rates. Even then the engineers, particularly in Electricity-de France, advocated marginal cost pricing, for the sake of resource use efficiency. They said the loss to the utility could be compensated by a lump-sum payment to the utility. This led to the concept of allowing a fair rate of return to the utility. Thus investment decisions and pricing decisions were divorced of each other, yet both with the same objective of achieving efficiency, in producing electricity of the right amount and using the electricity so produced so that maximum benefit is achieved. However, in recent times, due to increase in electricity equipment costs and the cost of coal, both marginal capacity and energy costs of electricity are on the rise, and marginal cost is more than the average cost. In such a situation, pricing based on average cost which is what is practised by most SEBs leads to passing on the benefits of past investment on cheap hydro thereby giving a misleading picture about the cost of producing extra power for today and tomorrow's additional needs. Table 1 illustrates the point. The hydro power from Sharavathi costs 12.75 paise per unit to KEB but the latest addition of thermal power at Raichur costs 92 paise per unit and the proposed Mysore Thermal 140 paise per unit clearly indicating that the marginal cost of power in Karnataka is rising and is much higher than the average cost. However, it must be pointed out that the computation of marginal costs as above, is neither along economic nor along the World Bank suggested lines. In fact the Tariff Committee has pleaded inability to compute capacity and energy costs either on accounting or on marginal cost basis (though this has not deterred it from formulating demand and energy charges without a basis).

Normally marginal capacity generation costs are incurred to meet the peak capacity demand at the margin. In Karnataka these are done by hydro plants, and the costs relate specifically to the power house component of the storage hydro plants which is about 55 per cent of total capital cost of hydro. The marginal energy costs are the costs of meeting energy demand at the margin, which is done by burning coal and generating energy in coal thermal plants based on merit order operation. A study conducted by the author for Karnataka in 1987 arrived at the marginal costs as given in Table 2.

The marginal capacity cost corresponds to Rs 9116/kW of average capital cost of hydro plant, with 40 years' life and 6 per cent discount rate, which is the long term cost of capital for KEB. System losses are taken at 4.8 per cent for EHT, 8.4 per cent for HT and 11 per cent for LT and a group coincidence factor of 0.7 for EHT, 0.6 for HT and 0.35 for LT. Investments in T and D are assumed. Cost of coal at power plant is taken at Rs 300/ton for the figures in Table 2. Now, we can assume pithead cost of coal as Rs 250/ton and transport and handling cost as Rs 500/ton for Raichur

Marginal energy cost would then be three times that shown in Table 2. Then the corresponding revised equivalent marginal power costs are 70 p/unit at EHT end, 78.5 p/unit at HT end and 106.5 p/unit at LT end.

Thus the figures of 92 p and 140 p/unit for Raichur and Mysore thermal (at EHT end) represent financial marginal costs of purchase from KPC, while the figures in Table 2 or their modifications refer to the economic marginal costs, to the State as a whole. It is not our case that marginal costs should be adopted overnight, but bringing tariffs progressively nearer marginal costs is desirable. If it leads to the board making excess profits, they can be directed to reinvest expanding the supply.

One reason for the high cost of power now and for the future is because the State had invested very little of the surplus of funds it got from the power sector in the power sector itself, eating out of its capital as it were. As long as KEB was surplus in power tariffs were low and KEB itself financially sound making profits. With increasing energy deficits imports from outside the State has led to increasing cost of power and this has eroded the profitability of KEB. Secondly, before fully utilising its hydro potential it has concentrated on having more thermal plants on the argument of a balanced hydro thermal mix and this has also led to higher cost of power.

COSTS AND TARIFFS

The accounting costs at various voltage levels and the tariffs—as existing, as proposed by the Tariff Committee and as announced by the board—are shown in Table 3.

The Tariff Committee, after conceding that "it was not possible to work out these (capacity and energy) costs more accurately in the absence of data" (p. 9) has gone on to compute the same nevertheless for marginal costs (p. 100). Alas, their understanding of marginal costs has been wrong, they have arrived at a set of figures for off-peak marginal energy cost, which are lower than peak marginal energy costs. 'Marginal' and 'off-peak' are antithetical. The committee working out the cost for LT rural is at best a guess work, since there are no meters to measure IP set consumption, and it is perhaps difficult to resist the temptation of passing off a bit of the T and D loss as agricultural consumption. In fairness to the committee, it has mentioned the difficulty in separating the T and D loss, theft and agricultural consumption, but to ask us to believe that IP sets consumption to be second highest at 30.5 per cent, next only to the HT industry consumption at 38.5 per cent without offer any data is asking a bit too much. Even on the cost side, a disproportionately large amount of KEB annual expenditure, to the tune of about 30 per cent is allocated to village electrification. Much of the criticism against subsidy to agriculture must be understood in this context that it is not based on hard facts, and one gets the impression that RE costs of 249 p/unit have been shown too much on the high side.

In fact quite apart from absence of meter

ing, there is no book keeping at present in any State Electricity Board to show the exact cost of rural electricity. Also the projected costs do not reflect the rural realities of indefinite power cuts to rural areas, and rostering, and idea originated specially for the rural consumers!

There is a controversy whether agricultural consumption should be metered or not. More specifically, the question is whether to have capacity or energy as the numeraire for consumption. A two part tariff, as for HT is clearly unwarranted on cost considerations. Here the common principle is that the tariff structure should follow the cost structure. Due to steep rise in delivered cost of coal, the proportion of marginal energy costs is most dominant in the total costs. Viewed from another angle, marginal energy requirements are met from imports and these are paid on the basis of energy units. Hence energy is the most appropriate numeraire and metering should be restored. This is, assuming that one wants to adopt the marginal cost approach. On the

basis of average cost, however, a large portfolio is still hydro, and energy cost is negligible and hence HP based tariff is suitable. The picture was different some time back, when Karnataka was an all hydro system and no imports of power were resorted to, during this time, marginal energy cost was the energy cost of hydro, which was close to zero. HP based metering was also appropriate then. However, we fully agree with the Tariff Committee that restoration to metering is not going to be easy at all for KEB. Removal of meters has been a one way trip, because it has proved to be very popular with the farmers, for it has liberated them from the clutches of the linemen! Even otherwise, an earlier study had indicated that the cost of meters and the cost of meter reading are more than the revenue collected. One of the chief engineers of KEB had confided that 25 per cent of HT meters are not working, hence metering of IP sets in distant places will materialise only on a distant date. Though the committee proposed a hike for agriculture sector, the board/government

the hike is very little

HT TARIFFS

HT Industry accounts for about 39 per cent of consumption. The industry has been made to bear the brunt of the tariff hike, with an increase of about 24 per cent. The government and the committee have clearly gone on the basis of inelastic demand for this category and their ability to pay. The industry on the other hand has been arguing that tariff must be set to them on the basis of cost—to serve principle. They have asked for FHTI rebate and even asked for rebate for night off peak consumption. Normally it is true that Western utilities adopt cost based pricing and also offer lower price for off peak power but it must be remembered that there is a situation of surplus power. When there is a power deficit situation as exists now for most SEBs, it is entirely appropriate for any producer to resort to demand based pricing, which in

turn means pricing 'what the traffic can bear'. By the same token bulk supply to colonies must be exempted from the hike, by reclassifying them. As regards the industry demand for off-peak rebate, the Tariff Committee has clearly spelt out why it is not applicable here, viz, a large amount of power is imported on per unit basis. There is an even stronger reason, the time of day pricing is relevant only in a situation like Tamil Nadu's where the capacity shortage is more than the energy shortage and the board can gain something by flattening the load curve. In Karnataka, with a large storage hydro portfolio offering 'banking' facilities, peak demand management is not the main issue, except between 6 to 9 p.m. Hence there is no case for off-peak rebate. In fact it can be argued that there is no case at all for two part tariff in Karnataka for any category, and all consumers can be billed on energy consumption alone. This may even reduce some scope for malpractice in noting the monthly maximum demand. The industry has also alluded to the inflationary impact of hike in tariff. For the industry as a whole, electricity bill accounts for about 5 to 7 per cent of the total cost, hence a 25 per cent increase in tariff will lead to about 1.25 per cent in cost, and in some industries part of this 1.25 per cent increase can be absorbed and need not be passed on to consumers or downstream industries. Hence there is no meat in the inflation argument too. The industry has also questioned the hike in view of the good reservoir position, thus mitigating if not obviating the need for high cost of imports. The Tariff Committee has considered this aspect and has recommended rebate for good hydro position and price sur-charges if the cost of coal or the cost of imported power goes up. Even though this approach is a faithful representation of reality, the wisdom of allowing wild fluctuations in the long-term price of electricity is questionable. This is because, for power intensive industries their very viability may depend on the price of electricity and they can ill-afford to absorb wild fluctuations. Hence perhaps rightly the board/government, has decided not to pass on the benefit of good monsoon to the consumers, but at the same time they will also absorb the price increases due to adverse monsoon or due to increase in price of imported power in the next two years. The fuel surcharge will be narrowly applicable for KPC's thermal portfolio only.

The board has given incentives for fixing capacitors, but here the Tariff Committee's caution has to be borne in mind, it says people fix capacitors to get rebate and later take them off!

DOMESTIC/AEH

Apparently, this category is given power on a no profit no loss basis. Fair enough. However, there is no need to retain the anachronistic AEH category, once beneficiaries of cheap power through declining block tariff, now on the receiving end being classed

as rich people! True, electricity for heating use must be discouraged, but this can be achieved by a simple increasing block tariff, which is in vogue anyway.

There has been scathing criticism on the inefficient working of KEB and even the former chairman of KEB, as chairman of Tariff Committee has given a list of suggestions to improve the performance of KEB—along the lines of 'all I wanted to do, but could not?'! Notwithstanding these 'inefficiencies', which are a bit exaggerated, the bottom line is good monsoon and more hydro exploitation means less or no power cut, to consumers and profit position to KEB and woe-unto both, otherwise! In short in god we must trust, and also hope that more money is committed for higher level of exploitation of hydro potential.

In the present context, both the tariff hike to industry and the subsidy to agriculture

are inevitable, for different reasons. Industry should realise that the option is not between price increase or no price increase, but rather between price increase and power cut and the choice is clear. However once the hike is accepted, the board and government are obliged to ensure that in future power availability is ensured by committing the resources so mobilised to expansion of low cost power generation. The board must ensure one other thing, which does not take much investment, viz, minimisation of power failures by better maintenance of distribution gear. Hundreds of suggestions can be made for performance improvement of KEB, but one fundamental requirement is that government must ensure a long-term tenure, of at least five years, for top management, including the chairman—whether a bureaucrat, technocrat or management professional—and finance and technical members, and avoid the uncertainty about it.

A Regulatory Framework for Mutual Funds

Samir K Barua
Jayanth R Varma
N Venkiteswaran

One major change that has taken place in the financial services industry is the establishment of a large number of mutual funds. Though only nationalised banks and financial institutions are permitted to set up these funds there is increasing pressure to allow such funds to be set up in the private sector. It is time therefore to introduce appropriate legislation to govern the functioning of mutual funds.

This paper discusses the various issues connected with the operation of mutual funds and proposes a set of regulations to ensure that they are effective. The proposed regulations draw heavily on the Investment Company Act of 1940, the US legislation on operation of investment companies.

I

Introduction

THE changes in the Indian financial services industry over the last five years have spawned several new institutions, new instruments and an entirely new breed of market players. The establishment of several mutual funds under the aegis of public sector banks and investment institutions is one of the more significant of these developments.

The first open ended fund in India, the Unit Scheme 1964, was set up by the Unit Trust of India (UTI) established under a special act of parliament, the Unit Trust of India Act, 1963. The basic objective of the act was to encourage savings through financial intermediation. The fund proved quite popular with both individuals and corporations and its size by 1990 has grown to about Rs 7,000 crore. Over the years, Unit Scheme 1964 has come to be regarded as primarily an income fund. The same institution also promoted the first close ended fund, known as Mastershare, in September 1986. This fund started with a corpus of Rs 150 crore, to which about another Rs 83 crore were added in March 1989. This fund, conceived as a growth fund, has also been very successful. The funds are highly liquid; for Unit 1964, UTI provides two way quotations for sale and repurchase every month while the mastershares are listed and actively traded in all the major stock exchanges in the country. The management and trusteeship for both the funds are performed by UTI itself.

The success of these two funds, particularly the second fund, generated pressure on the government to allow nationalised banks and private organisations to establish mutual funds. The banks were finally given the green signal, and since then the Indian market has witnessed establishment of several mutual funds by the large nationalised banks. These funds have a variety of objectives: growth, income, growth and income and providing tax shelter to the subscribers. The objective has a major influence on the investment policy of the fund. A growth fund is likely to be of portfolio predominantly of stocks, an income fund is likely to invest mainly in bonds while balanced portfolio would serve the objective of growth and income. The tax

shelter funds are based on government concessions available for investments made in certain kinds of securities which serve the economic and social needs of the country. The funds being conceived are increasingly meeting the diverse needs of individuals. Given the burgeoning growth in the funds mobilised by these funds, the time has come to understand clearly the role they play in the economy and also frame regulations to streamline their functioning.

Mutual funds compete with other forms of savings in the economy. Their major attractions from the point of view of an individual are: access to expertise in investment decisions, economies of scale in transaction costs and cost of search for information, diversification achievable through size, convenience because of absence of book-keeping on a variety of assets, liquidity of investments and ability to choose a fund which meets the precise cashflow needs. Given these advantages, these funds have proved extremely popular in the more developed capital markets. If the initial response is any indication, they have come to stay in the Indian financial environment. While they are useful for individuals, what larger impact do mutual funds have on the economy in general?

There is little evidence to conclude (based on studies done in the Western markets) that popularity of mutual funds results in a higher rate of savings in the economy. However, because of their ability to undertake superior analysis, their entry in the market in large numbers ought to result in better information flow, more efficient pricing of securities and consequent efficient allocation of resources. It has been observed that participation of mutual funds in the capital market generally results in a rise in the market capitalisation, thereby raising the price-earnings ratios. If nothing else changes, this would reduce the cost of capital for the private sector and encourage investments. This is beneficial for the economy as it opens up avenues for growth. However, high price-earnings ratios may also prove counter-productive by introducing a element of instability in the market if the prices are bid so high that their maintenance at those levels depends too long on unrealised expect-

tations. Should one conclude, that on the balance, establishment of mutual funds is beneficial for the economy?

This would be so only if we are able to ensure that the growth of mutual funds is along orderly lines. Experience, the world over as well as our own, confirms that at least in the sphere of economic activity government ownership does not constitute public good and norms of operational conduct need to be applied with equal force to public sector organisations as well. Our own none-too-long experience with mutual funds points to several questionable practices, such as guaranteeing a minimum return on a fund which is meaningless if a large portion of the fund is invested in equity, providing no information on the investment strategy of the fund thereby giving no clue to subscribers about the risks involved, collecting amounts which are much larger than the initial intent without well thought out policy on gainful deployment of funds, withholding information from subscribers on performance of the funds, and (possible) charging of unjustifiably high management fees and expenses for managing the funds. Since the management and trusteeship of these funds reside in one body, ensuring investor protection is an obvious casualty. There is an urgent need therefore to rein in the operations of these funds through appropriate regulations.

The regulatory framework must, therefore, be designed to ensure that the mutual funds are managed for the benefit of their investors. The mutual funds must not become instruments for benefiting the promoters or the government and its favoured (public sector) institutions. Nor should they be transformed into mere tax avoidance devices. Another objective of the regulatory system should be to ensure that mutual funds do not exploit their privileged position to gain an unfair advantage over individual investors who choose to manage their portfolios themselves.

These regulatory concerns become more serious in the Indian situation where the regulatory system for securities markets, in general, is very weak and inadequate. Indeed, the emergence of mutual funds on a large scale makes the task of strengthen-

ing securities regulation more urgent and critical. The government of India has recently announced a set of guidelines for mutual funds. These, however, only spell out the general rules for good behaviour of mutual funds without laying down any specific norms they must observe for investor protection. Drawing on the legislation in countries with longer experience of mutual funds, such as the Investment Company Act of 1940 of the US, it should be easy to evolve a comprehensive set of guidelines for operation of mutual funds in India. This paper examines the emerging practices of the mutual funds in India and suggests an appropriate framework for regulation of their operation.

II

Issues Needing Legislation

In this section we discuss the significant issues that arise from establishment and operation of mutual funds in an economy. We describe the limited Indian experience on these issues and wherever relevant briefly describe the American experience. These discussions provide the basis for the legislation we propose in the subsequent section.

Taxation. The mutual funds floated by public sector banks and financial institutions are exempt from income tax under the provisions of Section 10(23D) of the IT Act. The Unit Trust of India has long enjoyed this exemption under Section 32 of the UTI Act. In addition under Section 80L(1)(va) of the IT Act the income distributed by these funds qualifies along with dividends, interest on bank deposits and certain other government securities for a tax exemption up to an aggregate limit of Rs 13,000. As a result of this, even short term capital gains earned by the funds acquire the quality of dividends and qualify for deduction under Section 80L in the hands of investors merely because the gains have been routed through a mutual fund.

Private sector mutual funds, even if permitted, are not viable because the above tax concessions are not available to them. If a private mutual fund is organised as a company, it will suffer from double taxation, as both corporate as well as individual income tax will be charged. Subject of course, to the provisions of Section 80M of the IT Act. If the mutual fund is organised as a trust then under the provisions of Section 161(1A) of the IT Act the income of the fund will be taxed at the maximum marginal personal tax rate, which is far higher than the tax rate applicable to most small investors. Therefore, private mutual funds are at a tremendous disadvantage vis à vis public sector mutual funds.

Individual investors too are worse off as compared to a public sector mutual fund in terms of taxes. The interest on debentures does not qualify for any tax concessions. Thus the mutual funds gain an unfair advantage over an individual investor who puts his money directly in debentures. This

could be a major reason for the lack of an active secondary market for debentures. The mutual funds are increasingly driving the individual investor out of the debenture market. This is highly unfortunate and undesirable.

Thus the government has used taxation as a major tool to restrict competition from the private sector. This is undesirable because in the long run, healthy competition is in the interest of individual investors as well as the economy. We believe that tax concessions should be extended to all, thereby making private mutual funds viable. Otherwise the government will stand accused of promoting tax avoidance devices which even allow 'laundering' of low risk debenture interest into tax free income.

The taxation of mutual funds should be based on the principle that investors should, as far as possible, be taxed as if they had invested their funds themselves and earned the income directly. One simple way of achieving this effect would be to enact a proviso to the effect that nothing in Section 161(1A) shall apply to a mutual fund. Section 161(1) would then operate to ensure that the trustee of the fund shall be assessed "in his representative capacity only, and the tax shall be levied upon and recovered from him in like manner and to the same extent as it would be leviable upon and recoverable from the [investor]".

Disclosures and Information Dissemination. Since mutual funds are typically organised as trusts, the offer document is not a prospectus within the meaning of the Companies Act. The offer document thus seems to be totally outside regulatory purview, and there seem to be no provisions about what information must be disclosed. In addition, the only remedy to an investor who has put money in a mutual fund on the basis of misleading statements in the offer document is a common law action for deceit. The benefit of Section 62 of the Companies Act will not be available. The issuer will also escape all criminal liability under Section 63 of the Companies Act.

It is necessary to point out here that even in the case of companies, the enforcement of legal provisions relating to prospectus leave much to be desired. The worst offenders in this respect are the highly misleading advertisements on television and in the press.

While the Securities and Exchange Board of India (SEBI) is debating about the form and content of an ideal prospectus for the corporate sector, the mutual funds are raising large funds from the public with full official blessings on the basis of scanty information. A study of the offer documents of two recent schemes (Ind Jyothi Units—Annual Income and Growth Scheme, 1990 and Magnum Multiplier Scheme, 1990) shows a number of deficiencies.

The offer documents are totally silent on a number of critical issues that are of immense concern to any prospective investor. (1) The offer documents give no details on

the investment policy the fund proposes to adopt, that is the proportions of total investment in various securities. Thus, subscribers have no clue as to the risk they may be assuming by investing in the fund. Without this crucial information, the guaranteed minimum return (announced by one of the funds) is meaningless.

(2) There is no mention of management fee and management expenses that is likely to be charged to the funds.

(3) There are no details about frequency and the method of computing NAV, nor is there any mention of how the sale and repurchase prices will be linked to the NAV. Incidentally, government guidelines allow a spread of 7 per cent between sale and repurchase prices which, in our opinion, is absurdly high.

In our opinion, it must be mandatory to disclose full information on investment policy, management fee and other expenses of the fund, as well as the policy on computation of NAV and how it will be linked to sale and repurchase prices. It is also equally important to ensure that the mutual funds are not allowed to change the rules of the game later without the consent of the members. For example, there must be a legal mechanism to ensure that a fund does not deviate by choice from the stated investment policy later. The current practice of the trustees (read the promoter bank) retaining untrammelled powers to amend the terms of a scheme and making all such amendments binding on the subscribers is retrograde and oppressive.

In the United States, open ended mutual funds are required to compute their NAVs twice every day and the difference between the repurchase and the resale price is not allowed to exceed 2 per cent of the NAV. In India, the largest open-ended mutual fund, Unit 64 scheme of the UTI, does not publish NAVs at all and sets monthly repurchase and resale prices well below the prevailing NAV. The close ended funds in India, either do not announce their NAVs at all or do so very erratically. The most regular in this respect is UTI's Mastershares which usually publishes outdated NAV once a week, the lag between the computation and the announcement dates sometimes being more than a week.

Management Fee and Transaction Cost

There are no guidelines on the maximum management fee and other operating expenses that may be charged/incurred by a mutual fund. Recently, a leading mutual fund has published summarised results, the expenses incurred by various schemes vary widely as can be seen from table.

It is surprising that while there is extensive (and in our opinion, excessive) regulation of managerial remuneration in the case of companies (Sections 198, 269 and 314 of the Companies Act), there seems to be none regarding the management fee paid to the investment managers of mutual funds. The need for regulation in this case is far greater

because the investment manager, the promoter, and the trustee are all effectively the same (one being a subsidiary of the others)

Considering that the profitability of the nationalised banks, the major promoters of mutual funds in India, is under tremendous pressure, there could be a temptation to overload the mutual funds with charge for expenses. It also needs to be explicitly provided that the executive salaries and rent and other administrative expenses be borne by the investment manager out of its fee and not charged to the mutual fund separately

The US law restricts the management fee to a maximum of 1 per cent of the value of funds managed. There is also a restriction on the expenses that may be charged for managing the fund. In practice, however, possibly due to intense competition, the management fee actually charged averages only about 1/2 per cent. It has also been observed that the fee charged to individuals is even lower, about half the amount charged to mutual funds. Empirical studies done in the US market indicate that on an average, the mutual funds turn the portfolio over about once a year. The studies also indicated that performance of funds has no definite relationship with either the fee charged or the portfolio turnover.

While it would be necessary, in the long run, to conduct studies in the Indian market to come up with appropriate ceiling on management fee and other costs, to begin with some ceiling needs to be prescribed based on the laws elsewhere and judgment about the Indian market.

Management of Mutual Funds The government of India guidelines specify that the mutual funds must be managed by "professionals with proper qualifications and experience of industry, capital market and other relevant fields. At least 40 per cent of the trustees on the board of trustees should be persons of eminence in suitable fields who are not representing or associated with the promoters, that is, should be independent outside members."

In actual practice, however, the settler, the trustees and the managers are limited to the banks and their wholly owned merchant banking subsidiaries. The entire management and day-to-day operations of the funds are handled by persons who are on deputation from the promoter bank. This could result in the following undesirable consequences.

(1) Absence of a long term orientation in the deputed staff as they know that their tenure in the organisation is short and that they will go back to the promoter bank to pursue their

career. It might be relevant to recall that one of the banes of India's public sector in the early years was the deputationists culture brought by bureaucrats deputed from the government with little long-term commitment to the deputed organisations.

(2) Undue direct and indirect influence by the parent bank officials over the deputed staff managing the mutual funds.

(3) Inability to build-up expertise and specialised knowledge due to the changing profile of the staff.

It will be appropriate to bring in regulation which requires approval of appointment of the investment manager by the general body of unit holders. Such a regulation would be in line with the regulations prevailing in the Western capital markets and our own Companies Act which mandates shareholder approval for managerial appointments.

Issues Relating to Capital Market The fact that mutual funds in India are run by banks and financial institutions raises the spectre of massive insider trading. These institutions, in their role as bankers, term lenders or merchant bankers are privy to a large amount of confidential information about their clients. By using this inside information they could boost the performance of the mutual funds managed by them. Such insider trading is inimical to the development of a healthy capital market.

The problem of insider trading is not peculiar to mutual funds. It is a much more endemic phenomenon in India, and is in large part attributable to the total lack of legal and regulatory safeguards against insider trading. (Many kinds of insider trading are not illegal in India, and in any case there is no regulatory agency for investigating such activities and prosecuting offenders.)

Despite claims about the existence of a Chinese Wall around mutual fund operations, it is extremely unlikely, that the mutual funds will not be tempted to breach the wall just a little so that 'inside' information flows in. Besides, since the funds are managed by executives deputed from the banks/institutions, they have informal access to corporate information from the commercial and investment banking wings of the parent bank.

In the primary market, the promoter banks are either directly or indirectly in a position to influence the issuers to make firm allotment of shares to the mutual funds under their umbrella. In a country where new issues are heavily oversubscribed, as they are systematically underpriced (thanks

to the price fixation policy of the controller of capital issues), firm allotment of large blocks of equity in favour of mutual funds gives them a tremendous unfair advantage. Since the new issues generally provide high initial returns, mutual funds can show superior performance by benefiting from such a policy.

Inter-Scheme Dealings: Since each mutual fund currently manages several schemes there is considerable scope for transactions between different schemes. These transactions may be influenced by the need to show superior performance by a few selected schemes which are then advertised to sell newer schemes to the public. Transfers done from one scheme to another with such motives are extremely unfair to the subscribers of schemes which are currently neglected by the mutual funds. Such unethical practices must be outlawed as they deny the full returns due to the subscribers of a given scheme. Enforcing this through legislation may be difficult as the transactions may be put through a broker to give it a semblance of genuineness.

Fears on this score are based on newspaper reports* on such transfers from one scheme to another. Privately too, managements of mutual funds believe and state that in India no scheme is ever going to be genuinely liquidated in the market, it is only going to be taken over by floating newer schemes. This is extremely improper unless the subscribers to the new schemes are taken into full confidence and made aware of the above compulsions.

In this context the US law is quite clear as it prohibits transactions between an investment company and any affiliated person. The US law also prohibits any offer to a holder of the security of an investment company to exchange his security for a security in the same or another investment company on any basis other than relative net asset values.

Exercise of Voting Power Most mutual funds in India are organised as trusts. Under Section 187B read with Section 153B(4) of the Companies Act, they cannot exercise any voting power in respect of shares acquired by them if the paid up value of the shares exceeds Rs 5 lakh. The voting power in these cases is exercisable by the public trustee who is a government official. We think that Section 187B of the Companies Act was a misguided attempt to curb 'benami' holdings. It has served no worthwhile purpose and ought to be scrapped. In any case, its application to mutual funds is totally absurd. At the very least, mutual funds should be exempted from this section.

It may be noted that the guidelines announced by the government specify that, "A mutual fund shall not invest more than 5 per cent of its assets in the shares of any company. Similarly, it shall also not invest in more than 5 per cent of the shares of any

* India Fund Sells to Unit 64 Oswal Agro, *The Economic Times*, February 6, 1990

TABLE

| | Scheme 1 | Scheme 2 | Scheme 3 | Scheme 4 |
|--|----------|----------|----------|----------|
| I Total investments (Rs crore) | 96.3 | 196.4 | 121.4 | 30.2 |
| II Expenses incurred as a percentage of investments (year end) | 6.1 | 1.1 | 2.8 | 8.2 |
| III Expenses incurred as a percentage of the year's income | 30.4 | 5.9 | 6.2 | 18.2 |

company under 'any one scheme' These guidelines, while useful *per se*, leave the issue of corporate control wide open as several funds/schemes can together acquire a significant voting power in a given company.

Investment Policy The guidelines cited in the previous paragraph limiting a mutual fund's holdings in any single company ensures diversification of portfolio and limits the possible misuse of funds to benefit a particular company. We are also in agreement with three of the other guidelines announced by the government.

(1) Mutual funds should not borrow or pledge their assets in the normal course, during temporary emergency these can be done and duly reported to SEBI.

(2) A mutual fund should not again normally invest in another mutual fund or keep deposits with companies.

(3) The mutual fund must take/give deliveries in all their transactions.

III

Regulations on Operation of Mutual Funds

The discussions in the preceding section are the basis of the regulations we propose in this section. These regulations should form the core of what may be described as 'The Investment Companies Act 1990'.

(1) An investment company means any person (including a company, trust, partnership or association) which

- (a) issues or proposes to issue any security or has outstanding any security which it has issued, and
- (b) is, or holds itself out as being engaged primarily or proposes to engage primarily in the business of investing, reinvesting or trading in securities.

But excludes

- (a) persons primarily engaged in the business of underwriting and distributing securities, selling securities and acting as brokers,
- (b) banks, insurance companies and similar financial institutions,
- (c) charitable trusts,
- (d) any person whose outstanding securities are beneficially owned by not more than one hundred persons and which is not making and does not presently propose to make a public offering of its securities.

For the purpose of this definition security includes shares, debentures, notes, bills, commercial paper, bonds, units, trust certificates or in general any interest or instrument commonly known as a security.

(2) No income tax on surtax shall be payable by an investment company in respect of its income by way of interest, dividend, capital gains or the profits and gains of business of investing, reinvesting or trading in securities.

(3) Where the income of an assessee includes dividends or other income distributed by an investment company, that part

of such dividends shall qualify for the deduction under Section 80I of the Income Tax Act as is attributable to income earned by the investment company from sources (like dividends) which themselves qualify for deduction under Section 80I. For this purpose every investment company making a distribution of income shall provide a certificate to its security holders providing the above information.

(4) The provisions of the Companies Act relating to prospectus shall so far as may be, apply to an offer document issued by an investment company. These include provisions relating to

- (a) civil and criminal liability in relation to misstatements (Sections 62 and 63)
- (b) penalty for fraud in inducing persons to invest money (Section 68), and
- (c) matters to be stated and reports to be set out in the prospectus (Section 56 and Schedule IV) so far as these are relevant to mutual funds.

(5) The investment policy of a fund shall be specified in the offer document by clearly stating the aggregate proportion that the fund plans to invest in short-term instruments and long term instruments. Within the long term instruments, it shall specify the proportions that are to be invested in stocks and bonds.

These proportions are likely to change with the changes in the market value of securities. In such an eventuality on every liquidation it shall be mandatory for the fund to reinvest in a manner that would restore the proportions to the declared values.

(6) The terms of any scheme of an investment company shall not be varied without the approval of the security holders in general meeting. The provisions of the Companies Act relating to alteration of memorandum and articles of association shall, so far as may be, apply to such a variation. The provisions of Section 106 and 107 of the Companies Act relating to variation of shareholders rights including the right of dissentient shareholders to approach the court shall also apply to an investment company.

(7) The provisions of section 187B shall not apply to shares held by an investment company. In other words, the investment company shall be entitled to exercise voting power in respect of its shareholding.

(8) Every investment company shall hold an annual general meeting of all security holders to consider the annual accounts. The provisions of the Companies Act relating to annual general meeting and annual accounts shall so far as may be apply to investment companies also. In particular, the annual accounts shall include a statement on the shares and debentures held by the fund. The number, the cost and the market value of these securities as on the balance sheet date shall also be included in this statement. The profit and loss account shall be itemised at least with respect to each category of income and expense representing more than 5 per

cent of total income or expense.

(9) The provisions of Section 169 of the Companies Act relating to the right of 10 per cent of the shareholders to requisition an extraordinary general meeting shall apply to the security holders of an investment company.

(10) The provisions of Sections 255, 256 and 257 of the Companies Act relating to appointment of directors shall apply to the appointment of trustees of an investment company. This means that two thirds of the trustees shall be subject to retirement by rotation and shall be appointed in general meeting.

(11) The general body of security holders of an investment company shall be entitled to place such restrictions on the powers of the board of trustees as the general body of a company is entitled to place on the board of directors under Section 291 of the Companies Act.

(12) The provisions of the Companies Act relating to appointment and removal of auditors, their qualifications and disqualifications and their powers shall apply to the auditor of the investment company. In particular, the auditors shall be appointed in general meeting.

(13) The provisions of Sections 397 and 398 of the Companies Act relating to the powers of the court to prevent oppression and mismanagement shall apply to an investment company.

(14) The provisions of Section 416 of the Companies Act relating to contracts in which the company is an undisclosed principal shall apply to an investment company. These provisions require the terms of any such contract to be reduced to writing and submitted to the board.

(15) The management fee is a charge for the expertise and efforts involved in designing and maintaining a portfolio. Since expertise needed depends on the type of portfolio and the effort does not necessarily increase linearly with the size of the portfolio, the management fee should be a function of both.

There shall be ceiling of one half of 1 per cent of the funds managed for an all equity portfolio, and a ceiling of one quarter of 1 per cent of funds managed for an all bonds portfolio. For balanced portfolios, the ceiling shall be worked out using these two limits. The ceilings themselves shall decrease with the size of the portfolio according to the following schedule.

| Size of Fund (Rs '00 crore) | Management Fee |
|--------------------------------|--|
| < 200 | 1.0 per cent of funds |
| < 400 | 2 cr + 0.95 per cent of funds in excess of 200 |
| < 600 | 3.90 cr + 0.90 per cent of funds in excess of 400 |
| < 800 | 5.70 cr + 0.85 per cent of funds in excess of 600 |
| < 1000 | 7.40 cr + 0.80 per cent of funds in excess of 800 |
| > 1200 | 9.00 cr + 0.75 per cent of funds in excess of 1000 |

The management fee applicable to an all bonds portfolio shall be one half of the fee applicable to an all equity portfolio of the same size. The above management fee shall cover executive salaries and administrative expenses including office rent and the investment company shall not incur any additional expense in this regard.

(16) The ceiling on annual transaction cost would be based on the turnover of the portfolio expected in a year. An all stocks portfolio is likely to be turned over more frequently as compared to an all bonds portfolio. While specifying the limit, a transaction cost of about 0.5 per cent has been assumed.

The average annual transactions cost over the life of an all equity fund shall not exceed 1 per cent of the value of the fund. The average annual transactions cost for an all bonds fund shall not exceed 0.5 per cent of the value of the fund. This would imply that on an average these portfolios are not expected to be turned over more than twice and once a year respectively.

(17) It shall also be mandatory for the fund to compute and publish the net asset value every day. The fund shall also, periodically (end of every quarter) announce the details on the securities held in the portfolio.

The resale and repurchase price of an open ended fund shall be specified every day such that they straddle the NAV and the difference between them is less than 2 per cent of the NAV.

(18) An investment company shall not invest more than 5 per cent of its assets in the shares of any company. Similarly, it shall also not invest in more than 5 per cent of the shares of any company.

(19) An investment company shall not borrow or pledge its assets.

(20) An investment company shall not invest in another investment company.

(21) An investment company shall take/give deliveries in all their transactions.

(22) An investment company shall not enter into any transaction of purchase or sale of securities with the promoters or trustees or any persons/institutions in which the promoters or trustees are interested.

(23) No offer shall be made to a holder of the security of an investment company to exchange his security for a security in the same or another investment company on any basis other than relative net asset values.

(24) Any investor who has been affected by the violation of any of the above guidelines shall be entitled to sue the trustees and the promoters for damages. In addition, the trustees and other officers shall also be subject to penalties which may be imposed on a prosecution by the government.

CENTRE FOR DEVELOPMENT STUDIES

TRIVANDRUM - 695 011

The Centre is interested in recruiting bright young persons as *RESEARCH ASSOCIATES* to participate in its teaching and research activities relating to population and development.

Candidates for the post should have a Masters degree with a high second class and Ph.D. in Economics/Statistics/Demography/Sociology/Regional Planning. Those who have submitted the Ph.D. thesis are also eligible to apply. Candidates should have an interest to carry out interdisciplinary research on some aspects of linkages between population and development.

The scale of pay is Rs 2200-75-2800-100-4000 and allowances on par with Central government employees in Trivandrum. Higher starting salary may be given in deserving cases. Upper age limit is 32 years with the usual relaxation for reservation categories. The appointment could be on regular basis or on contract basis for a fixed period.

The Selection Committee may relax the qualification in exceptional cases and can also consider suitable candidates from outside the list of applicants. Those selected at the preliminary screening based on the evaluation of application may be called for a personal interview. Candidates belonging to SC/ST, backward communities and women are specially encouraged to apply. Application on plain paper giving (1) name (2) address (3) date of birth (4) educational background from higher secondary indicating subjects studied, marks/class obtained and University (5) academic distinctions or honours (6) work experience indicating position held, period and organisation (7) list of publications with full citation (8) names of three referees and (9) any other relevant information should reach the **Director, Centre for Development Studies, Prasanth Nagar Road, Ulloor, Trivandrum 695 011** before June 30, 1991. Applicants should also enclose a copy each of their best publications.

FORM II-A
(See Rule 4A (1))

FORM OF GENERAL NOTICE TO BE GIVEN TO THE MEMBERS OF THE PUBLIC BEFORE MAKING AN APPLICATION TO THE CENTRAL GOVERNMENT UNDER SUB SECTION (2) OF SECTION 22 OF THE MONOPOLIES AND RESTRICTIVE TRADE PRACTICES ACT, 1969.

NOTICE

It is hereby notified for the information of the public that JINDAL STRIPS LIMITED proposes to make an application to the Central Government in the Department of Company Affairs, New Delhi, under sub-section (2) of the Monopolies and Restrictive Trade Practices Act, 1969 for approval to the establishment of a new undertaking/unit/division. Brief particulars of the proposal are as under:

Demand for Textiles in India

G V S N Murty
T R Sukumari

It is often alleged that the growth of the Indian textile industry is constrained by demand factors, in particular the demand from the household sector. This being so, it becomes necessary to assess the patterns of existing demand for textiles in order to examine how this may be improved. This study examines the pattern of textile consumption, its quality component and income and price elasticities of demand, in order to derive the crucial factors to improve household textile demand.

I

Introduction

THE textile industry occupies a pride of place in the Indian economy. It is one of the largest industries in the world in terms of spinning and weaving capacities. After a period of relatively good performance in the 1950s, it has been characterised by a deceleration in output and investment growth. The severe recession of the mid sixties also affected this sector adversely. In recent years, structural changes have been pronounced in the production of textiles and in the mode of production. The organised mill sector has shown a significant fall in output while the decentralised sector has doubled its output during 1970 to 1986. The aggregate output growth of cotton textiles is below the population growth while it is far above that for synthetic and blended fabrics. Thus there is a shift in the mode of production from mill sector to decentralised sector (mostly power looms) and shift away from the production of cotton cloth to synthetic and blended varieties.

The structural changes in the production of textiles are reflected in the demand patterns of the largest buyer, the household sector. After showing a stagnancy in the per capita consumption of cloth (PCC) in 1970s, an improvement is witnessed both in the quantity and quality of consumption of the household sector. The yearly PCC which was around 13.52 metres in 1981 had increased to 16.45 metres in 1987. Within the textile group cotton cloth has maintained a constant level of 10.5 metres while the non cotton and mixed varieties have shown gradual increase. The percentage of textiles in the total consumer expenditure also witnessed a gradual increase from 8 to 11 per cent from 1970 to 1987.¹ Thus the consumption of textiles in the household sector has improved both in quantity and quality terms.

It is often alleged that the growth in the Indian textile industry is constrained by demand factors, in particular the demand from the household sector. As this industry in recent years is not facing severe constraints on account of raw material and other factors of production and in view of the fact that household sector is the largest buyer of textiles, the growth of the industry depends on the growth in household demand. In this context it is important to enhance the demand for textiles so that the textile industry

would not conceive the sickness observed earlier.

The improvement in household demand for textiles could be visualised through

- (1) Enhancing the growth of per capita income or per capita consumption expenditure (PCE),
- (2) An appropriate pricing policy
- (3) An appropriate structure of relative prices of different varieties of clothing.

This study examines the pattern of textile consumption, its quality component and the income and price elasticities of demand, to cull out the crucial factors to improve the household textile demand. The analysis is carried out by resorting to the estimation of two stage complete demand systems for textile consumption. In the first stage the pattern of textile consumption is examined along with other items like food, fuel etc., of the consumption budget, while in the second stage the pattern of consumption of varieties of textiles is examined.

The two stage model is developed and estimated with the available information. The models are seen to be theoretically consistent and empirically manageable, so that the approach could be utilised efficiently in projecting the future demand.

This paper also provides a scenario analysis on household demand for textile in India for the years 1995 and 2000. The sensitivity of projections across alternative growth patterns of per capita consumption expenditure and that of alternative price changes are examined. By making plausible assumptions about non household demand and exports, the fibre requirement of cotton, synthetics and cellulosics in 1995 and 2000 are also estimated. We hope the estimates would be useful in planning the textile sector in understanding the structure of textile demand and in assessing the role of price mechanism in improving demand.

The next section provides the trends in textile consumption. Section III concentrates on the analysis relating to the two stage demand model. Section IV examines the emerging per capita demand patterns in value and quantitative terms for the years 1995 and 2000 under alternative PCE and relative price scenarios. Section V provides the projected estimates of aggregate demand in 1995 and 2000 along with the fibre requirements. Section VI summarises the results.

II

Trends in Textile Consumption

We have four alternative data sources on consumption/availability of textiles in India. They are (1) National Accounts Statistics (NAS), (2) National Sample Survey on Consumption Expenditure (NSS), (3) Economic Survey (ECS) and (4) Consumption of textiles published by the market research wing of the Textile Committee (CPT). The NAS and ECS data are based on production estimates while the rest of the two data bases are from the consumer surveys carried out from time to time. The NSS and CPT data provide rural urban break up of textile consumption while the other two are for the country as a whole. Since this study concentrates on the demand patterns for the country as a whole, we rely heavily on the NAS and CPT data.

Table I provides the estimates of average annual compound rate of growth (ROG) of textile consumption in quantity and value terms and of textile prices for the period 1976 to 1987. These rates are arrived at by estimating semi log trend equations. The NAS and CPT data are used for this purpose. The growth rates from the NAS data refer to textile consumption at 1980-81 prices.

It can be seen that the NAS per capita textile expenditure (PTE) at 1980-81 prices has grown at a rate of 3.10 per cent while the CPT data show a growth of 7.3 per cent. The consumption of textiles in metres has grown at a rate of 2.17 per cent. For cotton, the growth is negative (-0.72 per cent) but statistically insignificant while it is impressive for non cotton (15.41 per cent) and mixed varieties (12.65 per cent). The fact that the growth in the value terms (at 1980-81 prices) is higher than that of quantity implies the presence of improvement in the quality of textile consumption. The quality improvement is also reflected in the shifts in the composition of consumption. Cotton textiles, which accounted for 90 per cent of aggregate consumption (in metres) in 1976, declined to 65.8 per cent in 1987, the share of non cotton increased from 3.5 per cent to 14.7 per cent and mixed varieties from 6.3 to 19.5 per cent. The growth in aggregate household demand during 1976 to 1987 is 1.59 per cent for cotton, 18.01 per cent for non cotton and 15.19 per cent for mixed varieties. These trends broadly indicate that the non-cotton and mixed varieties would

play a dominant role in the future consumption budgets of the household sector

Textiles prices witnessed a growth of 6.55 per cent with NAS and 6.15 per cent with wholesale price index (WPI) data. With CPT data it is around 11.22 per cent. The CPT price data is simply the ratio of value to quantity of consumption. The movements of this ratio, therefore, cannot be considered as reflecting the price changes as the budget shares within textile group are allowed to change over the period. Thus an alternative price index with 1980-81 budget weights is constructed. The growth in this index (constructed with 1980 CPT budget weights), broadly confirms the pattern reflected in NAS and WPI data. Thus the prices of textile are seen to increase at a rate of around 6.5 per cent during 1976 to 1987.

As per the CPT data, 35 per cent of textile consumption in value terms is accounted for by cotton, 32 per cent by non-cotton and 33 per cent by mixed varieties. Price change in any one of them would induce a change in the price of textile. For example, *ceteris paribus* change of 10 per cent in the prices of cotton would imply 3.5 per cent change on textile prices and a 10 per cent change in non-cotton and mixed varieties would imply 6.5 per cent change in the price of textiles.

The demand for textiles depends on the relative price structure of items like food, fuel, etc. Any change in the relative price structure of these items would affect the aggregate textile demand which in turn would alter the demand structure of the different varieties of clothing. An improvement in the demand for textiles in the country therefore depends on the sectoral pricing policies of the government and in particular the policies for cotton, non cotton and mixed varieties. It is necessary, therefore, to assess (1) what is the percentage change in the demand for textiles because of a certain percentage change in income or PCE? (2) what is the percentage change in the demand for textiles because of a change in the price structure of food, fuel, etc., (3) what is the change in the demand for the individual varieties of textiles with a change in the above factors along with changes in the price structures of the varieties. In the next section attention is focused on these aspects by calibrating a two-stage demand system for textiles.

III

Two-Stage Demand Model for Textiles

The distribution of growth over different types of economic activity and of income over socio-economic groups are the key factors that determine the process of economic development. In this context the successive adjustments between the production possibilities and demand patterns play a crucial role in forging a link to the complex chain of economy wide processes. Such adjustments unveil different implications for long run policy formulation. If the impediment

in the production is because of demand factors, it is highly important to examine the pattern of demand and identify the factors affecting demand.

In a policy model when one attempts to solve the implementation problem as far as possible by arranging for zero demand pressure in the consumer market, it becomes an important statistical and econometric problem to estimate the complete set of demand elasticities i.e., income, own price and cross-price [Frish 1962]. The pattern of these elasticities reveals the possible directions of change in the demand patterns.

These directions of change could be used in targeting the production and in tracing the factors (controllable) that impede the growth in demand. They also throw light on the likely impact of alternative government policies (mostly income and price) on demand and in turn production.

Recognising the above need several research organisations and government agencies have estimated price and income elasticities of demand for textiles in India. The approaches adopted to arrive at the estimates however are different and in many cases are not comparable.

The estimates depend on the specification of the models, the data base and the methods of estimation. The market research wing of the Textile Committee (MRTC) for example uses the data for one year to arrive at price and income elasticities. The price variable in this is defined as the ratio of value to quantity of consumption. Thus these elasticities suffer from severe specification problems which limit their use for policy prescriptions.

The first systematic attempt to build demand models for textiles was made by Murty [1983] followed more recently by Goswami [1990]. These studies integrate the NSS data on consumer expenditure with that of CPT data to arrive at a two stage demand model for textiles.

In the study by Goswami [1990] the estimated elasticities suffer from defects. These defects, as will be shown later in this paper, are mainly because of the specification of the price variable in the model. The price variable is specified as the ratio of value to quantity of consumption. The elasticities therefore represent the compounding effects of prices and quality and use of them for policy purposes would yield results which will be far from reality.

A two stage demand model is formulated in this paper to examine the pattern of price and income elasticities. The first stage model reveals the direction of change in textile demand owing to change in PCE and prices of four broad groups, viz., food, clothing, fuel and others. The second stage model reveals the direction of changes in the demand for varieties of clothing owing to changes in the prices of varieties and PTE. In both the stages a Linear Expenditure System (LES) is postulated, which is derivable from the Stone-Geary utility function.

Writing P_1, P_2, \dots, P_N and Q_1, Q_2, \dots, Q_N as the price and quantity of consumption of N goods in the first stage allocation of PCE, say $M (= \sum P_i Q_i)$, then the first stage LES system can be written as:

$$P_i Q_i = P_i C_i + B_i [M - \sum P_j C_j] + u_i \quad (1)$$

$i = 1, 2, \dots, N$
In this system C_i 's are interpreted as committed quantities (or expenditures) and B_i 's as marginal budget shares (MBS) i.e. $\sum B_i = 1$. Given M , $(M - \sum P_j C_j)$ provides the 'supernumerary expenditure' and the consumer is assumed to allocate it across goods, in proportion to B_i , the MBS of i^{th} good. Thus the estimates of B_i provide information on how a consumer distributes additional income on the i^{th} good.

Analogous to the first stage model the second stage model can be written as:

$$P_i Q_i = P_i c_i + b_i (m - \sum P_j c_j) + v_i \quad (2)$$

where $m - \sum P_j c_j$ is PTE and k is the suffix for textile group in the first stage LES model. u_i and v_i are stochastic terms.

In the second stage model also, $\sum b_i = 1$ and c_i 's are the committed quantities (or expenditures) within the textile group. Since the models are based on utility maximisation hypothesis, the set of demand relations in (1) and (2) satisfies all the theoretical requirements.

The fulfilment of the theoretical conditions requires that $B_i > 0$ and $b_i > 0$. The committed quantity interpretation for C and c_i is only suggestive and it is not always possible when $C < 0$ and $c < 0$. This negativity however is not inconsistent with the theory.

The LES models in (1) and (2) are a simultaneous system of non-linear equations with the parameters B_i, C_i, b_i and c_i . The empirical results that follow are obtained by adopting the iterative Zellner's [1962] estimator.

TABLE I AVERAGE ANNUAL COMPOUND GROWTH RATES (1976-1987)

| Item | Growth Rate | R ² |
|-----------------------------|-------------|----------------|
| <i>Per capita</i> | | |
| PCE at 1980-81 prices (NAS) | 2.16 | 0.94 |
| PTE at 1980-81 prices (NAS) | 3.10 | 0.85 |
| PTE at 1980-81 prices (CPT) | 7.30 | 0.89 |
| Cotton (metres) | 0.72 | 0.20 |
| (not significant) | | |
| Non cotton (metres) | 15.41 | 0.94 |
| Mixed (metres) | 12.65 | 0.94 |
| All textiles (metres) | 2.16 | 0.68 |
| <i>Aggregate</i> | | |
| Cotton (metres) | 1.59 | 0.54 |
| Non-cotton (metres) | 18.01 | 0.95 |
| Mixed (metres) | 15.19 | 0.95 |
| All textiles (metres) | 4.53 | 0.91 |
| <i>Prices</i> | | |
| NAS | 6.56 | 0.97 |
| WPI | 6.20 | 0.97 |
| CPT | 6.50 | 0.96 |

tion procedure after linearising the models with Taylor's series expansion. The cross-equation restrictions are imposed in the Zellner's procedure and is repeated until the parameters converge. The stochastic terms u_i and v_i in different equations are assumed to be contemporaneously correlated with zero mean and common covariance matrix. The estimated covariance matrix of residuals at each iteration is used in Zellner's procedure. The converged estimates will be identical with Maximum Likelihood (ML) estimates. The expressions for the complete set of elasticities which are worked out at the sample mean are given below.

First Stage LES

Income elasticity of good i wrt PCE,

$$E_i = B_i/W_i \quad (3)$$

Price elasticity of good i wrt j^{th} price,

$$E_{ij} = E_i \phi - E_i W_j (1 + \phi E_j), \text{ for } i=j \quad (4)$$

$$= -E_i W_j (1 + \phi E_j), \text{ for } i \neq j$$

where $\phi = -(M - \sum_j P_j C_j)/M$

W_i = estimated budget share for the i^{th} good from the first stage model

Second Stage LES

Income elasticity of good i wrt PTE,

$$e_i = b_i/w_i \quad (5)$$

Price elasticity of good i wrt j^{th} price,

$$e_{ij} = e_i \theta - e_i w_j (1 + \theta e_j), \text{ for } i=j \quad (6)$$

$$= -e_i w_j (1 + \theta e_j), \text{ for } i \neq j$$

where $\theta = -(m - \sum_j p_j c_j)/m$

w_i = estimated budget share for the i^{th} good from the second stage model

DATA AND RESULTS

For estimating the above demand models we need information on prices, quantities (or constant price expenditures) of consumption of different items in the consumer budget and similar data for textile sub group also. Previous studies on the subject have used the NSS data on consumer expenditure for the first stage model and income class wise CPT data for the second stage. In view of the fact that the NSS estimates of cloth consumption are biased downward, we utilise the time series NAS data on consumption for four broad groups—food, clothing, fuel and others—spanning the period 1960 to 1986. The implicit price indices (with 1980-81 = 1) are used for P_i 's in the model. For the second stage model we utilise the CPT time series data on three varieties of textiles—cotton, non cotton and mixed—spanning the period 1976 to 1987. The time series data is used to minimise the compounding effects of quality on price elasticities. If time series of cross section data, along with the price variable defined as the ratio of value to quantity of consumption are used, then the price elasticities will be biased as they also include the quality effects.

Table 2 gives the ML estimates of the first stage model along with the estimated budget shares (W_i) and the explanatory power of the model (R^2). The asymptotic standard errors of the estimates are not given as they

are all statistically significant.

It can be seen that all B_i 's (i.e. MBS) are positive and MBS is maximum for others followed by food and clothing. The MBS for textiles as a whole is estimated to be 0.158, i.e., an average consumer would spend Rs 15.80 on textile from an additional PCE increase of Rs 100.

The complete set of elasticities presented in Table 3 reveals the income elasticity of demand for textiles as 1.5942 and own price elasticity as -0.5938, implying thereby that textiles is income elastic and price inelastic in nature. Further a 10 per cent rise in food prices under *ceteris paribus* assumptions is seen to reduce the demand for textiles by 6 per cent. Among other goods in the consumer budget the adverse effect of a rise in food prices is highest for textiles.

The elasticities are within the range of cross country estimates reported in Table 4. In consequence the first stage model can be viewed as consistent. Looking into the magnitude of cross country estimates

doubts arise about the validity of the results reported by Goswami [1989].

The parameter estimates and elasticities of the second stage model are given in Tables 5 and 6 respectively. These tables indicate that MBS is the highest for non-cotton and is followed by mixed and cotton varieties. Cotton accounts for a negligible MBS which is consistent with the data during the period. The elasticities within textile group are negligible for cotton. The demand for cotton textiles therefore is insensitive to a change in PTL or price of cotton. The elasticities for non cotton are estimated as 2.488 wrt PTE and 2.029 wrt own price, the corresponding elasticities for mixed are estimated as 1.048 and 1.422. Thus non-cotton and mixed textiles are elastic wrt PTE and own price.

The cross price elasticities (Table 6) indicate that a 10 per cent rise in non cotton prices under *ceteris paribus* assumptions would increase the demand for mixed varieties by 7 per cent while a 10 per cent rise

CHART 1: DECOMPOSITION OF DEMAND FOR TEXTILES
(10 Per Cent Fall in Non-Cotton and Mixed Prices)

in prices of mixed varieties would increase the demand for non-cotton by 4.9 per cent.

The estimates of second stage model also deviate markedly from the results reported by Goswami [1990]. Goswami estimated the own-price elasticity of cotton within textile group as -1.2827 while the estimate in this paper is only -0.1326 . It should be noted that the simulations or demand projections will be sensitive to the magnitude of price and income elasticities and thus Goswami's results cannot be taken to reflect the true changes. If that is the case what are the factors that explain the difference? This aspect is discussed below.

Goswami [1989] used the CPT time series of cross-section data for textile consumption and unit values for prices which include also some part of quality. When a demand model is postulated, it is assumed that the observations are generated as if they are random drawings from a population facing different price structures. If quality variation is not present we should expect only one price for all consumers in each year. But the CPT data show a one-to-one correspondence between unit value and income. We present below a tentative model which can partly take into account the quality effects on the elasticities.

Let us assume that in period t , we have income classes and the corresponding unit values for cotton are p_1, p_2, \dots, p_k . The average unit value p^* for all income classes together can be obtained as a weighted average of p_1, p_2, \dots, p_k . The quality premium paid by i^{th} income class for cotton will be $(p_i - p^*)$ which may be positive or negative. If quality variation is present, it will be positive for higher income classes. We can now decompose the value of consumption of cotton for i^{th} income class as $(p_i - p^*) q_i + p^* q_i$.

The first part represents the quality component of total expenditure on cotton. This decomposition could be used to formulate a LES type model to estimate it from the time series of cross-section data.

If three varieties of textiles are considered, LES will become a six equation system, where the three additional variables represent quality.

$$(p_i - p^*) q_i = [p_i - p^*] c_i + b_i [m - \sum_{j=1}^3 (p_j - p^*) c_j - \sum_{j=4}^6 p^* c_j], i = 1, 2, 3 \quad (7)$$

$$p^* q_i = p^* c_i + b_i [m - \sum_{j=1}^3 (p_j - p^*) c_j - \sum_{j=4}^6 p^* c_j], i = 4, 5, 6 \quad (8)$$

In this model b_1, b_2, b_3 would yield the quality effect on the MBS while b_4, b_5, b_6 provide the MBS net of quality.

The CPT time series of cross-section data

for the period 1973-87 are used to examine the quality effects. Weighted ML procedure is used to estimate the six equation system by taking the number of estimated households in each class as weight. The estimated quality effects on the MBS are given in Table 7.

With an increase of Rs 100 in PTE, Table 7 reveals that the actual increase in cotton expenditure would be Rs 10.66 and quality component Rs 1.77. The total quality component of MBS for cotton, non-cotton and mixed varieties works out to be around 11.14 per cent of the increase in PTE. When this component is not distinguished, the actual MBS would be biased which in turn affects the elasticities. The nature of bias depends on: (1) the distribution of income class-wise prices around the average price, and (2) the shifts in this distribution over the period.

The results relating to quality effects amply demonstrates that the LES estimates based on all observations of CPT time series of cross-section data on varieties of textiles would yield inconsistent directions of change in demand patterns. The inconsistencies could be minimised by estimating LES models for each income class (or a group of classes), since the intra-class variations in quality would be less prominent than inter-class variations.

In order to assess the extent of deviation in MBS and elasticities with the full data set, LES with CPT data is estimated by taking all the income class-wise observations for the period 1976 to 1987. Data on six income classes for each year are used amounting to 72 observations in all. The income class-wise price data are defined in the index form by taking mean level price of 1981 = 1.0. Since the number of households is not constant

CHART 2: DECOMPOSITION OF DEMAND FOR TEXTILES
(20 Per Cent Fall in Non-Cotton and Mixed Prices)

across the income classes and for each income class across years, weighted ML procedure is used to arrive at the parameter estimates. These estimates are presented in Table 8 and elasticities in Table 9. A comparison with the results given in Tables 5 and 6 reveals that all-class model overstates the MBS for cotton and understates for non-cotton; for mixed textiles, however, the difference is marginal. These features, unequivocally indicate that estimates based on unit values need correction for quality changes.

IV

Per Capita Demand Projections for Textiles: 1995 and 2000

This section portrays the likely household demand for textiles for the years 1995 and 2000. The LES models estimated in the previous section are used for this purpose. While formulating alternative scenarios the following features as revealed by the LES parameter estimates are taken into account

- (1) PCE price of textiles and food significantly affect the demand for textiles.
- (2) 10 per cent change in cotton prices would induce 3.5 per cent change in textile prices.
- (3) 10 per cent change in the prices of non-cotton and mixed varieties would induce 6.5 per cent change in textile prices.
- (4) Non-cotton and mixed varieties of textiles are income and price elastic in nature.
- (5) Cotton is inelastic both wrt price and income.

Looking into these features, it can be emphasised that the demand for textiles in household sector would depend on the growth in PCE, and changes in the prices of food, non-cotton and mixed textiles.

For projecting the future demand for textiles nine price scenarios and three PCE scenarios are considered together. The nine price scenarios are as follows:

- PS1: No change in relative prices.
- PS2: 10 per cent fall in the prices of cotton.
- PS3: 10 per cent fall in the prices of non-cotton.
- PS4: 10 per cent fall in the prices of mixed variety.
- PS5: 10 per cent fall in the prices of non-cotton and mixed varieties.
- PS6: 20 per cent fall in the prices of cotton.
- PS7: 20 per cent fall in the prices of non-cotton.
- PS8: 20 per cent fall in the prices of mixed varieties.
- PS9: 20 per cent fall in the prices of non-cotton and mixed varieties.

The three PCE scenarios are as follows:

- ES1: 2.5 per cent increase in PCE.
- ES2: 3.5 per cent increase in PCE.
- ES3: 4.0 per cent increase in PCE.

The scenarios from PS2 to PS4 imply 3.2

to 3.5 per cent fall in the textile prices, while those from PS6 to PS8 imply 6.4 to 7 per cent fall. PS5 and PS9 imply a 6.5 per cent and 13 per cent fall in textile prices. It should be noted that the price scenarios refer to a fall in prices over the projection period while the PCE scenarios refer to yearly changes.

In all the scenarios, the relative prices of food, fuel and others in the first stage model are assumed to be constant. 1987 is taken as the base year for projections and the LES parameter estimates are converted into 1987 prices. The CPT expenditure on textiles, which is Rs 356.53 for 1987, is taken as base value. Since the CPT and NAS estimates of textile consumption differ markedly, the elasticity estimates from the first stage are used to project the demand for all varieties of textiles. The first stage projected estimate along with the second stage parameter estimates of LES are used to arrive at the demand for individual varieties.

The detailed steps involved in the projections are given below.

Step 1: Given a price scenario work out the change in textile price.

Step 2: Use the LES first stage elasticities (given in Table 3) along with step 1 result and PCE growth, to derive the growth in PTE over the projection period.

Step 3: Work out the actual PTE with the help of step 2 result and the base value of consumption of textiles.

Step 4: Use step 3 result along with the second stage LES estimates (given in Table 5) to arrive at projections for the varieties of cloth.

The per capita demand (PD) is more responsive to PCE growth than price reduction. This is as expected, since the price reduction refers to the entire projection period, while PCE growth is on yearly basis.

The PD for all textiles, which is 16.35 metres in 1987 will be in the range of 18.7 to 24.84 metres in 1995 and between 20.47 and 30.02 metres in 2000. The PD will be maximum when price reduction is envisaged for both non-cotton and mixed varieties. It will almost be invariant when price reduction is envisaged separately for each of the varieties (i.e., in PS2, PS3, PS4, PS6, PS7, PS8). The composition of demand however will

TABLE 8: PARAMETER ESTIMATES OF LES
(All Class Model: Stage 2)

| Commodity | b | c | w | R ² |
|------------|--------|-----------|--------|----------------|
| Cotton | 0.1185 | 41.7087 | 0.4308 | 0.9701 |
| Non-cotton | 0.5571 | -142.3861 | 0.2581 | 0.9833 |
| Mixed | 0.3244 | -52.7362 | 0.3112 | 0.9886 |

TABLE 9: ESTIMATES OF PRICE AND EXPENDITURE ELASTICITIES
(All Class LES Model: Stage 2)

| Commodity | Elasticity wrt the Price of | | | Expenditure Elasticity |
|------------|-----------------------------|------------|---------|------------------------|
| | Cotton | Non-cotton | Mixed | |
| Cotton | -0.5497 | 0.2016 | 0.0731 | 0.2750 |
| Non-cotton | -0.4751 | -2.2578 | 0.5739 | 2.1589 |
| Mixed | -0.2294 | 0.7641 | -1.5772 | 1.0426 |

The PD for cotton textiles in 1995 and 2000 is insensitive not only to its own price reduction but also wrt the prices of non-cotton and mixed. It will be in the range of 10.8 to 11.8 metres in 1995 and 11 to 12 metres in the year 2000. On the contrary the increase for non-cotton and mixed varieties will be sizeable with a reduction in the prices of all the varieties. The PD for non-cotton, which is 2.4 metres in 1987 will be in the range of 3.73 to 7.29 and 4.68 to 9.19 metres in the years 1995 and 2000 respectively. The PD for mixed textiles, which is 3.20 metres in 1987, will be in the range of 3.98 to 6.75 metres in 1995 and 4.59 to 8.63 metres in 2000. Alternative scenarios thus exhibit a wider range of projections for non-cotton and mixed varieties. The prevalence of such a marked range in projections is plausible in view of the fact that the PCE and price scenarios represent both the pessimistic and optimistic alternatives.

Since it is difficult to discuss in detail the magnitude of all the PD projections, we present in Table 10, the emerging demand in 1995 and 2000 by assuming 2.5 per cent PCE growth, which is slightly above the growth witnessed in recent years.

The PD for cotton will almost remain invariant maintaining a level of around 11.00 metres in both the periods. Price reduction induces substantial shifts in the demand for non-cotton and mixed varieties. During 1987 to 1995, the shift in non-cotton would be from 2.40 to 4.09 metres without price reduction, and would reach the level of 4.87 metres with 10 per cent fall in prices and 5.83 metres with 20 per cent fall in prices. For mixed varieties the shift would be from 3.2 to 4.34 metres and to 4.85 metres and 5.48 metres with 10 and 20 per cent price reduction respectively. Thus with 10 per cent fall in prices the PD for non-cotton would be increased by 100 per cent and mixed varieties by 52 per cent. With a 20 per cent fall in prices the PD for non-cotton and mixed varieties would be increased by 143 per cent and 71 per cent respectively. During 1987 to 2000, the PD for non-cotton would be increased by 160 per cent and 208 per cent with 10 per cent and 20 per cent price reduction and that of mixed varieties by 80 per cent and 103 per cent respectively.

In order to assess the significance of price reduction we present in Table 11 the changes in PD due to price reduction and PCE growth. The non-cotton and mixed varieties are taken for this purpose. In 1995, with 10 per cent price reduction, 69 per cent of the increase in PD will be on account of PCE growth for both non-cotton and mixed varieties and 31 per cent on account of price reduction. With further price reduction the contribution of price and PCE growth would remain the same, i.e., about 50 per cent. However, in the year 2000 the contribution of PCE growth will be sizeable: 76 per cent with 10 per cent fall and 59 per cent with 20 per cent fall. Charts 1 and 2 depict the contributions of price reduction and

mixed varieties. These results thus show the importance of price reduction to improve the per capita domestic demand.

The estimates of aggregate household demand for the years 1995 and 2000 are given in Table 12. These are arrived at by assuming the population in 1995 as 904 million and that in 2000 as 999 million. With 10 per cent price reduction, the aggregate demand in 1995 and 2000 would be 18,676 and 23,136 million metres respectively. The corresponding estimates for individual varieties in million metres are: 9,890 and 11,149 for cotton textiles; 4,402 and 6,244 for non-cotton; 4,384 and 5,744 for mixed varieties.

mainly due to non-cotton and mixed varieties and this increase will be sizeable with further price reduction.

V

Aggregate Demand for Textiles and Textile Fibres

Total demand for textiles comprises household demand, non-household demand, and exports. The non-household demand and exports in 1995 and 2000 are derived by making plausible assumptions. The exports of cotton textiles in 1995 and 2000 are

TABLE 13. DEMAND FOR COTTON, SYNTHETIC AND CELLULOSIC FIBRES

| Prices | Year | Cotton (Lakh Bales) | Synthetics (Million Kg) | Cellulosics (Million Kg) |
|------------------|------|------------------------|----------------------------|-----------------------------|
| No change | 1995 | 115 | 513 | 200 |
| | 2000 | 134 | 698 | 271 |
| 10 per cent fall | 1995 | 115 | 586 | 228 |
| | 2000 | 133 | 733 | 285 |
| 20 per cent fall | 1995 | 114 | 658 | 256 |
| | 2000 | 133 | 910 | 354 |

assumed to be of order 1,200 and 1,800 million metres respectively. The corresponding exports of synthetics (including cellulose) are assumed to be of order 200 and 250 million metres.

For deriving the non household demand, the composition of household demand and non household demand in 1986 is assumed to remain same in 1995 and 2000. The aggregate consumption of textiles of the non household sector in 1986 is 2,200 million metres, of which cotton, non cotton and mixed varieties account for 1,444, 135 and 621 million metres respectively. The estimates indicate that the contribution of household sector in total demand of household and non household is 85 per cent for cotton, 93 per cent for non cotton and 77 per cent for mixed varieties.

The demand for synthetics is obtained by adding 82 per cent of non cotton demand with that of mixed varieties and exports, and by subtracting the cellulose share (which is 28 per cent of synthetics). The estimates of aggregate demand are used to arrive at the requirements of cotton (in lakh bales), synthetics (in million kg) and that of cellulose (in million kg). Table 13 provides the estimates with 2.5 per cent PCE growth assumption, and with three price alternatives: no change, 10 per cent fall and 20 per cent fall in relative prices.

The cotton requirement in 1995 and 2000 would be around 115 and 134 lakh bales respectively. The requirement is insensitive to the price scenarios. Without any change in relative prices the demand for synthetic fibres would be 513 and 698 million kg, while for cellulose it would be 200 and 271 million kg respectively. With 10 per cent price fall, synthetic yarn requirement would be 586 and 733 million kg in 1995 and 2000 respectively, the corresponding estimates with 20 per cent price fall would be 658 and 910 million kg. The fibre requirement of cellulose up to 2000 would be in the range of 200 to 354 million kg.

Price reduction of synthetics induces significant increase in the synthetic yarn requirement. This could be met in fact through the expansion of installed capacity. The installed capacity of synthetics in 1990 is 595 million kg while the licensed capacity is for 969 million kg. Thus, the yarn requirement up to 2000 could be met with the existing licensed capacity. However, the need for capacity expansion, and in turn the additional investment, would arise when the

PCE exhibits growth above 2.5 per cent.

It may be noted that the price reduction in textiles is possible only when government is keen to protect the textile industry and retain its status as one of the largest industries in the world. Although price reduction may lead to loss in the government revenue, the increase in household demand would be sizeable. At the same time the constraints faced by the industry on account of raw materials, import restrictions, and tariffs etc. have to be eased to enhance textile production in the country.

While deriving the estimates many assumptions are made which may affect the analysis adversely. We have not taken into account the demographic factors, the composition of rural/urban population, the structure of demand across income classes and spatial units etc. These factors have to be incorporated in the demand models to arrive at the complete set of elasticities and projections with less bias. Estimation of such models would not only help in efficiently tracing the changes in demand patterns but also in projecting the demand under alternative demographic scenarios.

VI

Conclusions

A two stage demand model is developed and estimated to assess the role of income and prices in the future demand for textiles. The following broad conclusions emerge from the analysis:

- (1) The demand for cotton textiles is inelastic both wrt income and its own price.
- (2) The demand for non cotton and mixed varieties is elastic both wrt income and own price.
- (3) Quality improvements in textile consumption are seen to exist.
- (4) The per capita demand for cotton textiles would almost remain invariant at a level of 11 metres up to the year 2000.
- (5) Substantial shifts in the composition of textile demand are seen to emerge in 1990 and 2000 and they will be in favour of non cotton and mixed varieties.
- (6) With 2.5 per cent growth in per capita total expenditure, per capita consumption of non cotton which is 2.4 metres in 1987 will be increased by 4.09 metres in 1995 without any price reduction, with 10 per cent and 20 per cent price reduction (in non-cotton and mixed varieties) it will be 4.87 and 5.83 metres respectively. The per capita consumption

of mixed varieties which is 3.4 metres in 1987 will be increased by 4.43 metres in 1995 without price reduction; with 10 per cent and 20 per cent price reduction the consumption will be 4.85 and 5.48 metres respectively.

(7) The contribution of price reduction to the increase in demand for synthetics is seen to be substantial.

(8) With 2.5 per cent PCE growth, the existing licensed capacity of synthetic yarn production would meet the yarn requirement up to the year 2000.

Notes

[We are indebted to Y. K. Alagh for valuable comments and suggestions.]

- 1 See National Accounts Statistics (NAS).
- 2 Per capita income and PCE are used synonymously in the subsequent analysis.
- 3 Capital letters are used for first stage model and small letters for the second stage model.

Employees and Organisation in India

Need to Move beyond American and Japanese Models

Rajen K Gupta

There has been a general tendency to pursue theories of organisation and management in a universalistic approach. But culture-specific ideas are beginning to take shape. This paper reports on the implications of recent psychoanalytic insights about the Indian 'self' (as distinguished from the American and Japanese 'self') for organisation and management. It also reviews major indigenous contributions and indicates new dimensions which need to be included in furthering culture-specific theories for organisations in India.

WORK organisation is a major human innovation. A modern society is unthinkable without it. Almost everything around in a home today is a product of a modern work organisation, so are the constantly flowing conveniences like water in the tap and electricity. For services like health, education and banking also we are dependent on the services provided by various work organisations. Easily the most complex aspect of any such work organisation is the organisation of people who make it work. Almost by definition an organisation cannot deliver the required products or services without the necessary co-operation of the people working in it. Such co-operation, however, cannot be taken for granted. Perhaps fortunately, in spite of seeing the necessity of such work organisations, people are unwilling to subjugate themselves totally and blindly to organisational imperatives as these may be framed from time to time. Hence there is a continuing quest for better designed organisations. One of the continuing acid tests of an organisational design is the extent to which it integrates the employees with the organisation without making them lose their dignity.

As and when necessary humankind created some kind of organisations to fulfil its needs throughout the recorded history of various civilisations. But apart from a few organisations for civic administration or for propagating religious ideas, not many large organisations existed before the first industrial revolution. Technology made it possible to operate large organisations for a more efficient service to the populace at large. Conscious, scientific study of the design of organisations is an even later phenomenon.

Those who began studying the organisations tended to take the universalistic nature of organisations for granted. So the pioneers assumed and began to look for universal principles of good organisational designs. In the next stage organisational thinkers began to compare aspects like technology, task or environment across organisations but continued to hold universalistic applications of their local findings. Comparative study of organisations across societies, nations or cultures is a very recent phenomenon not more than a couple of decades old.

India has lagged behind Western countries in the formal study of modern organisations.

Hence it has tended to be governed by the current international intellectual hegemony in this respect from time to time. The first major influence on organisational designs came from the imperial powers mainly United Kingdom, UK and USA having so many historical and cultural linkages between them, shift from British concepts to American concepts, but continued to retain a flavour of following universally applicable principles of organisational design and management. Some authors like Crozier¹ tried to draw attention to the cultural specificity of organisational functioning but did not deter the universalistic thinking enough.

The real point of departure from universalistic thinking came from the meteoric rise of Japan as an industrial power. America began to lose its economic hegemony. Experiences of interactions of Western executives with their Japanese counterparts during international business deals were puzzling to them, to say the least. Interest began to grow in the design and management of Japanese organisations. They were found to be so different from Western theories that universalism of Western theories got a big jolt. The 'Far-east' began to be prominent in suggesting a new paradigm of managing organisations.

Somehow, though universalistic hegemony of Western ideas for organisational management has given way to comparative views, Indian organisations are tending to see Japanese management as the next panacea. More and more organisations are trying to transplant Japanese practices hoping for the Japanese miracle to take place on Indian soil. But doubts persist and anxiety continues as to whether these ideas can work in India. The debate tends to swing between 'Japanese management is the answer' to 'Japanese management cannot work in India'. Lack of team work continues to haunt the organisations and the capitalistic greed of owners and managers keeps employees and their unions on their defensive guard. Public sector at large is disowned by everybody but for being exploited for personal gains. Employees in service organisations like banks make a mockery of customer service and public systems' employees seem to be self-serving rather than serving the public.

Perhaps nobody has the answer to the uni-

que problems of Indian organisations. Even with best efforts the solution to problems of such a recent human innovation in a developing society cannot be found overnight. But the approaches to discover solutions themselves need to be improved. The simple formula of borrow and try, and then accept or reject, will not do. Accepting the comparative perspective, there is a need to look deeper into ourselves, own up our history and culture. Then practices in other countries and societies can be treated as ideas to be examined in relation to the local context. Explorations can then take the shape of an active inquiry and search rather than one-shot internalisation of the current management fad.

This paper culls out some fresh insights about the similarities and differences between American, Japanese, and Indian psyche. Implications of these differences for the adaptation of American and Japanese management techniques by the Indian organisations are briefly indicated. The ideas of major Indian management thinkers are then examined in the light of the fresh insights. Finally the gap in management thinking so far have been identified to draw an agenda for theorisation, research and experimentation.

AMERICAN, JAPANESE AND INDIAN 'SELF'

Comparative views on 'self/psyche' are mainly coming from psychologically-inclined anthropologists and culturally-sensitive psychologists and psychiatrists. During the early part of twentieth century, interest in the study of culture and personality was there but then for many decades it remained on the periphery. There is now a renewed interest in understanding the subjective experience in different cultures.²

A major fresh step in this direction has been taken by Alan Roland.³ He is a psychoanalyst, but with a difference. Theoretical developments in psychoanalysis have been dominated by European, British and American psychoanalysts. Even while looking at other cultures the view has been constrained by the theories developed in these countries/cultures. There is a growing awareness now that theories about social phenomena are culture- and history-bound. Roland has taken courage to take on such a comparative historico-cultural stance while

Japan. On his journey to the East he made a conscious and deliberate effort to look for alternate concepts to understand the 'self' in Indian and Japanese cultures. He spent eight months in India mainly in New Delhi, Bombay and Bangalore. During this period he conducted short-term psychoanalytic therapy in Bombay over a total of five months with 12 English-speaking middle and upper-middle class Indian patients from five different religious communities, supervised two psychoanalysts and several social workers, attended a wide variety of case presentations at a variety of institutions, co-counselled three groups of women college students with a social worker and had lengthy discussions with a variety of psychoanalysts, psychologists, psychiatrists, social workers, anthropologists and sociologists. He also related his experience in India with his experience with Indian clients and students in America. Similarly he spent a month in Japan. There he supervised a number of analyses and held in depth discussions. Based on these he has come up with refreshingly original formulations of the nature of the 'self' in India and Japan is distinct from the American 'self'. He also articulates subtle differences between the Indian and the Japanese 'self'.

His formulations emphasise some major differences. According to him while in America develops a highly individualised self, Indians and Japanese develop a highly familial 'self'. Further, the structure of familial 'selves' of Indian and Japanese also differ. The following sections elaborate on these ideas.

AMERICAN VS INDIAN SELF

Comparing the American and Indian societies in terms of individual functioning Roland writes:

In Indian society with all its enormous heterogeneity the pervasive dominance of the extended family almost as an entity unto itself, is a constant. The importance of emotionally close well defined hierarchical family relationships with reciprocal responsibilities throughout life is even manifested linguistically, where there are specific words for each and every kinship relationship. This is in contrast to the Western generalised kinship terms of cousin, brother in law, and so forth. Specificity for highly complex kinship relationships becomes important in a social structure where the extended family is the dominant focus of an individual's life. It is therefore a necessity to understand Indian family relationships and structures to perceive the psychological make up. This, of course, is in contrast to American urban society where peer groups, and various other extra familial social contexts assume an ever increasing importance vis-a-vis family relationships. Occupational and other major life decisions are rarely left to the individual. Moreover, a multi-millennial world-view of the basic meaning of the life cycle is imbibed throughout the formative years into the

frequent religious festivals. It is not too much to generalise that Indian society stresses far more the extended family, community or *jati* (popularly known as caste) hierarchy, and the continuity of traditions than American society, which is so oriented towards change, social and physical mobility a multiplicity of social options, an egalitarian ideology, and considerable autonomy of the individual.⁴

Roland holds the position that "the intrapsychic development of the 'self' is congruent with the major socio-cultural patterns of a society and will therefore, vary in contrasting societies".⁵ As he "worked with patients and talked with Indian analysts, the picture that emerged of the Indian 'self' is one whose ego boundaries encompass others of the extended family, a 'self' less separate and differentiated intrapsychically than the 'self' of most Americans".⁶ Due to enormously close tie to the mothering person, and the cultural intensification of idealisations and veneration of parental figures, which is reinforced through mythological images, the Indian 'self' develops to be "far more deeply identified with family and 'jati' than a contemporary American" (p 242).⁷ And

Relationships to the Indian psyche are usually far more important than issues. Further Indians seem to make their major narcissistic investments in the self and family rather than in public places.⁸

Of further relevance in relation to work organisations is the patterning of aggression as a part of the familial self.

As Kamalini Sarabhai (personal communication) a psychoanalyst, put it, public spaces are not so much a man's land as an arena for conflict. The point she was making is that anger and hostility have to be controlled and contained within close extended family relationships; therefore, these feelings often become unconsciously split off and displaced outside the family.⁹

Moving beyond the contrast between the American 'individualised self' and Indian 'familial self' Roland goes on to point the 'spiritual' or 'transcendental self'. "Without positing such a self" he believes, it is totally impossible even to begin to comprehend the Indian personality society and culture.¹⁰ To him existence of such an aspect of Indian 'self' is indicated by "a mythic orientation to everyday relationships, a magic cosmic involvement with destiny, and the practice of a wide variety of rituals frequently associated with both myths and magic cosmic correspondences".¹¹ He also sees the Hindu cultural world-view giving spiritual meaning to interpersonal transactions and the various goals and stages of life.¹²

Contrasted with such a 'familial communal-spiritual self' of Indian is the gestalt of 'the individualised self' of American personality "where there is far more autonomy and individuation, and an imposed socio-cultural necessity to choose and take action on a number of social options ranging from

ideology, and activities as well as the need to self-create one's own identity. On the other hand, intimate relationships tend to be far more fragile".¹³ Roland does not compare Indians and Americans on the spiritual or transcendental dimension. From this contrast, it seems easy to infer that managerial innovations addressed to the individualised American 'self', such as detailed individual performance appraisal, management by objectives, job enlargement, job enrichment, etc, would not produce similar positive response from a strongly familial-communal-spiritual self.

INDIAN VS JAPANESE 'SELF'

There has been more work comparing Eastern and Western cultures and personalities than the differences within the Eastern hemisphere. Oftentimes Western analysts club all the Eastern societies together.¹⁴ But lately the study of differences amongst Eastern societies is beginning to appear. DeVos¹⁵ has given brief account of the differences in psycho-social homeostasis between the 'Chinese and Japanese 'self'. Roland's in-depth psychoanalytic work is amongst the first to compare and contrast Japanese and Indian 'self'. Differences between the two, as brought out by Roland, are especially relevant for the purpose of this paper. This is because sometimes lack of sufficient comparative analysis and the fact that Buddhism—which is the most-influential religious/spiritual doctrine in Japan—originated in India, can lead to a misplaced hope that Japanese approach to management of large organisations would fit the Indian situation like a glove.

It would however be useful to mention the discovered similarities between Indian and Japanese 'self' before elaborating on the differences. The major similarity can be stated quite clearly by reiterating the contrast pointed out between the Indian and American 'self'. It is that both Japanese and Indian 'selves' are not individualised but familial.

Taking off from Kluckhohn and Strodtbeck¹⁶ Triandis¹⁷ contrasts individualism with collectivism. According to him "individualism refers to the belief that the individual is an end in him/her self" and as such ought to realise the 'self' and cultivate his or her judgment notwithstanding the weight of pervasive social pressure in the direction of conformity with the views, needs, or goals of some in group'. On the other hand 'collectivism implies an emphasis on (a) the views, needs and goals of one or more in group rather than oneself, (b) social norms and duties defined by in-groups rather than emphasis on behaviour that results in individual pleasure, (c) beliefs and values shared within groups rather than beliefs and values that are idiosyncratic for particular individuals, and (d) readiness to co-operate with in-group members'.¹⁸

Roland's findings would place the American

... they come to the individualistic pole of the individualist-collectivist polarity while both Japan and India would fall close to the collectivist pole. Hsu's¹⁹ findings would place the Chinese 'self' also along with Japan and India. Roland (1988) finds that 'there is considerable similarity between Japanese and Indians inasmuch as both have far more open outer ego boundaries with less psychological space around themselves than Westerners a 'self' that is far more relational, a strongly set inner ego boundary that preserves a much more private 'self', and a more developed interpersonal sensitivity and interdependence.²⁰ As mentioned in the beginning he finds both Japanese and Indian 'selves' as 'familial' in nature as contrasted with the 'individualised' 'self' of the American.

Coming to the differences, the major distinction lies in the boundary of the familial 'self'. As indicated by the label 'familial' the primary family is the common in-group for the Japanese as well as Indian, but its extensions beyond the family differ. A minor detour via Hsu's comparison of Chinese and Japanese 'self' would be useful here.

Like its Chinese counterpart the Japanese culture says to the individual that his self-esteem and future are tied to his relationships with other human beings and not to himself. He must find his appropriate station in life by insuring for himself and his immediate family an appropriate place in such a human network. However, here the Japanese and Chinese part ways. All Chinese sons are tied to their first human group and their common ancestors, but Japanese inheriting sons and non-inheriting sons fare differently. For Japanese inheriting sons the situation is quite similar to that of their Chinese brethren. But Japanese non-inheriting sons must find their human network elsewhere.²¹

This expulsion from the primary family notwithstanding, Japanese culture provides quick and nearby alternatives through the institution of 'iemoto'. According to Hsu the core structure of 'iemoto' is that of a master-disciple (client) relationship.

Each master has several disciples (clients) with whom he maintains mutual dependence. He commands great authority over his disciples. He owes to them the best he has to offer (livelihood, instruction, justice and social responsibility), and his disciples owe him allegiance, subordination of his art and skill, and most of whatever he acquires. This relationship and its characteristic ideas are not economic, nor political, nor militaristic, nor religious. They can be applied to any field of endeavour, whether it be running a bean paste shop, an army, or a university.²²

All ties in the 'iemoto' are couched in pseudo-kinship terms. From this point of view each 'iemoto' [can grow into] a giant kinship establishment, with the closeness and inclusiveness of its interpersonal links but without the kinship limitations on its size.²³

The Chinese, on the other hand, were much more tied psychologically to their kinship base. Their rule of equal division of inheritance reinforced this tie from generation

to generation. . . Consequently, although the set of ideas of how human beings relate to each other (work, care, succouring, subordination and superordination, affiliation, competition, devotion, etc) which are characteristic of Japanese 'iemoto' was also present in China, the Chinese have largely restricted their application to those who were actually related through kinship bonds and their immediate extensions, in sharp contrast to the Japanese whose 'iemoto' organisation enabled them to live out these ideas far afield.²⁴

Very interestingly Roland's differentiation between Indian and Japanese 'self' has a close parallel with that of Hsu's between Chinese and Japanese 'self'. He calls the Indian 'self' as familial-jati' or familial-communal 'self' and the Japanese 'self' as familial-group 'self'. In the former the sense of belonging, loyalty and regard is restricted to the extended family, community and caste, while the Japanese quite smoothly transfers such sentiments to extrafamilial groups such as local clubs, associations, school as well as the work group. Hsu's sociological analysis of the rules for inheritance amongst Chinese also parallel that in India. This directly implies that in Japanese organisations group culture would be a natural consequence of the psycho-social milieu, but in India the familial-communal 'self' cannot be expected to transfer its loyalty to the heterogeneous work group. In fact it might be at the root of the lack of team work amongst Indians.

Roland also points out striking similarities and differences regarding mother-son relationship between Japanese and Indians. He identifies three aspects of this relationship.

The first is prolonged symbiotic mothering where there is enormous emotional involvement and devotion with considerable physical closeness, caring and affection. The second factor revolves around the high degree of maternal empathy with the child's inner feelings, needs, wishes, temperament and inclination.

The third factor is indeed more specific to the Japanese and involves intense maternal expectations for a very high degree of performance and skill in both relationships and tasks.

What is more specifically Japanese is that the mother uses her empathic understanding to encourage and guide her growing children in persisting and concentrating in their work in becoming fully emotionally engaged in doing something as well as possible in enduring all kinds of hardships and overcoming obstacles, in examining themselves for faults and correcting them (White, 1987) and for boys in competitively achieving in school.²⁵

In Indian case such a "maternal expectation for a high level of performance" is not equally prevalent. Hence while the Japanese tends to suppress his own wishes, "Indians seem far more in touch with their own wishes and wants, and are much freer to ask or manoeuvre to fulfil them."²⁶ Just as for Hsu the transfer of 'iemoto' sentiment is responsible for Japanese industrial success,

Roland considers these maternal expectations as a source of intense achievement motivation to be "a mainspring to the successful modernisation of Japan and its current economic success".²⁷ It is not difficult to see the complementarity of the two factors for rapid, successful industrialisation.

Extended 'iemoto' sentiment, group orientation, and high achievement orientation lead the Japanese to commit themselves very intensely to the work organisation as well as the whole society. But the strong family-'jati' orientation with low concern for social achievement leads the Indians to adopt a significantly different pattern of behaviour in non-family work or public/social settings. Though they contain their aggression in familial settings, they experience no urge to contain it in non-familial settings. Coupled with lack of internalised achievement orientation, they would be prone to non-productive expression of aggression and exploitation of work or public systems for personal/family gains at the cost of social good. Roland finds that

Clinical work with Indian patients not infrequently elicits bitter, angry feelings about a superior in the hierarchical relationship, although the overt behaviour remains highly deferential, conforming to the expectations of the situation. Or quite frequently the overt attitude is deferential but the actions are less than co-operative.²⁸

He goes further to say that

These highly personalised hierarchical relationships become models for other relationships outside of the extended family, particularly within one's own community or 'jati' (cf Sakala, 1981) 'where there is also a feeling of being at home, and even within some organisational hierarchies. B. K. Ramamujam (1986)²⁹ has emphasised that Indians are constantly gauging and testing the level of intimacy they may have with someone outside of the extended family. On the whole however there is a sharp division between one's own people of family and community, and others from other communities (Sinha 1980).³⁰ If more personalised familial type of hierarchical relationships are not established outside of family and 'jati' then these relationships can be characterised by very little caring of the other person, and in fact considerable manipulation of the other may take place for one's own ends."³²

Another major ground on which both Indians and Japanese appear to be similar when compared with Americans but show subtle differences between them is their attitude towards transcendental spiritual or the religious dimension. The dominant religious spiritual influence operating in India is that of Hinduism. Buddhism which originated in India as a reaction to Brahminical hold over Hinduism, travelled to Japan via China where it continues to be a major influence along with indigenous Shintoism, has little influence in India today. On the whole spiritual thought and conduct in India tends to be more esoteric than in Japan. The roots of Hinduism in Vedic

thought emphasise the possibility of realising or attaining oneness with the supreme being, while Buddhism holds no promise beyond salvation from human suffering. While Hindu spiritualism finds its day-to-day expression in religious rituals, Japanese spiritualism gets expressed in aesthetic pursuits. Hence Japanese spirituality is not other worldly while Hinduism subordinates the existent world to the esoteric one. As a result of which there is greater congruence of spiritual precepts and daily life in Japan than in India; in the latter contradictions between the preaching and practice are to be found in abundance.

In Japan there is much greater homogeneity amongst its people regarding their religious beliefs. There is nothing like the rigid caste system which in India contextualises even the right conduct. Japan can almost be seen as a large homogeneous religious spiritual congregation, with business organisation as an integral part of it. Hence the inculcation of spiritual values is an integral part of the training and development system of Japanese corporations.¹³

What comes through delineation of the concept of 'self' in America, Japan and India in the above is that there is an emerging consensus in a group of culturally sensitive anthropologists, sociologists, psychologists and psychoanalysts that there are basic differences between Western and Eastern cultures. Roland's work further illuminates subtle differences between the Japanese and Indian self.

MANAGEMENT AND NATURE OF SELF

It is also apparent from their success in industrialisation, that America and Japan have been able to develop organisational designs and management approaches with a productive fit between the psyche of employees and management policies and practices. Poor productivity of Indian organisations indicates that we are yet to achieve an equally effective fit.

The American model of management which has a match with the individualised 'self' would naturally have problems in integrating a familial 'self' with an independent entity called a company or organisation which considers employment relationship as a legal contract. Explicit focus on clearly delineated roles and responsibilities without visible concern for the well-being of the junior employee and his family would be a relationship doomed to be an alienating one from the beginning. Open discussion of strength and weaknesses would create an embarrassment which people with familial 'self' would prefer to avoid. Performance-linked punishments would not be in line with the ethics of seniors in the familial system. Katju (1986)³⁴ investigated the personal values of Indian managers of a large multinational organisation in India. Among the values which ranked high across different age groups was the value of domestic happiness. Perhaps this may be the reason why Indian

managers find it extremely difficult to dismiss an errant employee as it is argued 'he too has a family to support'.³⁵ In the same vein rewards are likely to be at least partially governed by relational rather than performance considerations. Hence the meticulously elaborate performance appraisal systems designed after American ideas are bound to be side lined or at best become mere paper exercises. Rao³⁶ has illustrated how covertly the officers in a public sector undertaking sabotaged a performance appraisal system which was established after their own consent.

Let us take a look at the more recently imported Japanese model of management. It is a more tempting model than the American because Indian 'self' shares major common differences with Japanese 'self' when compared with the American 'self'. Both Japanese and Indians have a familial 'self'. But what are the implications of the fact that while Japanese have a familial 'self' which incorporates the work-group as soon as they go out to work. It is true for the superior, subordinate as well as peers. On the other hand the Indian familial 'self' continues to be largely family or 'jati' centred. Hence in India the organisation, the work group, or the superior cannot benefit from the subordinate employees' familial 'self'. In fact Roland agrees with Kamalini Sarabhai's proposition that since the Indian contains his aggression as a family member, he splits it and shows it outside the family; for an Indian the work organisation is a place to earn the livelihood for the family and not a place where he belongs.

Just as for the subordinate employees, Indian managers with a similar familial 'self' are more likely to treat their subordinates as 'other-impersonals' rather than as 'own-personals' as would be seen by the Japanese manager who invariably gets involved with the personal problems and even in helping in the marriage of the subordinate.

Secondly, since the Indians harbour a narcissistic 'self' within the familial 'self' which is not so true for the Japanese, it would be more difficult to manage the Indian. It has often been found that even after being given explicit negative feedback by the more courageous of the Indian managers, very often Indian subordinates would when denied a promotion, lament that they were not told in advance about their shortcomings. What else would a narcissistic 'self' do but to deny any wounds inflicted on it and to blame the other in the process! Due to their more accessible private 'self' Indians are more likely to indulge in cribbing, blaming, gossiping and rumour-mongering frittering away their energies in non-productive form which may even have an anti-productivity ripple effect. Similar tendencies in the superior managers would compound this problem.

In summary, as contrasted with the American individualised 'self', Indian and Japanese 'selves' are familial in structure. Hence the American model of management

that attempts to provide meaningful autonomous work and reward to the individual may be grossly insufficient to integrate an Indian or Japanese in that! Very naturally then, the Japanese approach to management has baffled Americans. Actually the Japanese entrepreneurs and managers have achieved a fascinating continuity from family to the organisation in terms of the management of social relations and through it the reinforcement of the Japanese self. But as pointed out Japanese self develops to be a familial-group self while the India self develops into a familial-jati self. Work group does not directly figure in the Indian self, nor high maternal expectations for performance at tasks. Japanese organisations have also integrated the spiritual self of the Japanese into the organisation through symbolic organisational spirits/dieties and spiritual training.

From this fresh comparative psychoanalytic journey emerges the deep seated roots of the problem of integrating the Indian employee with the Indian organisation. The problem appears to be insurmountable if one imagines both the superior and the subordinate carrying the same familial-jati self into the work organisation. It would result in a mutually manipulative relationship with very weak integration with the organisation. This picture is consistent with the profile arrived at by Dayal,³⁷ and Sinha.³⁸ But Roland's deep psychoanalytic view indicates that improving the situation is going to be more difficult than assumed so far. Let us review the scope and limitations of the solutions suggested so far.

INDIAN THOUGHT ON MANAGEMENT

Apart from the faddists, mainly those falling head over heels for American or Japanese approaches, Dayal³⁹ and Sinha⁴⁰ have made major recommendations to address the uniquely Indian situation. Pareek⁴¹ has been working in action research mode to understand culture-organisation interaction. Tripathi⁴² has given some indications for the preferred direction. Chakraborty⁴³ has been vigorously following a strongly traditionalist approach steeped in Hindu philosophy.

ISHWAR DAYAL

Dayal's contribution to the issues under consideration comes from his dual perspective as an organisation theorist and a consultant in organisation design. Speculating about the implications of the characteristics of Indian employees for designing administrative systems in work organisations he writes that 'the most suitable behavioural characteristics of the administrative system should be the following:

(1) *Personalised relationships*: The employees' acceptance of the work organisation whose social system does not arouse feelings of being threatened, except when

basic norms are violated. The present notion of contractual relations between management and employees appear inconsistent with his expectations and needs. The code of conduct as represented in the standing orders also seems alien to the social system of his home and community.

(2) *Exercise of authority based on the affiliative rather than organisational position* This basis was recognised in the older pattern of management in India. The chief cashier brought his own people into the bank to handle the paying and receiving of cash. Only those whose relationship was established were employed and in case of misconduct, the employee was approached through the relative who invariably disciplined him. This very sentiment can be recognised in organisations in which management suggests that the trade union should have the responsibility for disciplining an employee.

(3) *The need for having a father figure who is seen to be sympathetic nurturant and benevolent as a father would be* Most employees address their senior managers as 'mai-bap'. For many people these sentiments are perhaps real. Personal relationships may need explicit recognition with due reward for loyalty.⁴⁴

On the other hand, Dayal notes that, "work organisations... appear to generate dependence on the superior, depersonalised relationships, emphasis on formal roles rather than closer informal relationships. Superiors convey such sentiments and values to their subordinates in work situations. These differences in the expectations of the two systems create a feeling of 'not being understood', 'no one cares for us', a feeling of being 'an orphan' in the organisation. The alienness is built into the system"⁴⁵

Dayal then goes on to describe his approach to designing the structure in the largest commercial bank in India keeping the Indian context in mind. The bank decided to have a two-tier management in medium and large branches in place of a single tier as earlier. It also created a position in the regional head offices to act as a human link between the branches and head office. The first feature has continued but the second could not be stabilised due to the inability of the people to sustain a role without much formal authority.⁴⁶ Dayal also recognises that the success or failure of prevailing personnel policies and practices in organisations in India are, in all likelihood, directly influenced by cultural factors. Then policies and practices may have to differ significantly from the Western and from those prevailing in public administration and in many large work systems where apathy and indifference among employees are far from uncommon.⁴⁷ Dayal's sweep of ideas and his application of the same in practical organisational design is admirable. However, without underestimating the value of his suggestion, by stopping at trying to create family like relationships in work settings he underestimates the pull of actual family, which very often would be away from the work organisation in the Indian

case. He has also shown some diffidence with the problem of overcoming the apathy and indifference among lower level employees. [Personal communication]. His continuing efforts on the issues with another large organisation would be worth knowing about.⁴⁸ Dayal, however, continues to ignore the spiritual or transcendental aspect of the Indian 'self' which Roland points out, can be ignored only at the peril of truncating the interpersonal relationships as well as curtailing the growth of the person. Japanese organisations, as noted earlier, do not ignore or neglect this aspect. Dayal himself quotes from the study by Seth⁴⁹ on the religious activities on the shop floor carried out by the workers but fails to develop on it.

J B P SINHA

J B P Sinha and his associates have been engaged in a major research programme for over 15 years to discover and enunciate a leadership style suitable for Indian organisations.⁵⁰ Theirs is the most systematic programme of its kind in India.

Sinha agrees with Dayal's summary of the subordinates' expectations in India.⁵¹ Apart from giving credence to the psychoanalytical and anthropological explanations of these expectations Sinha also suggests some historical and economic reasons for the pattern of needs and expectations. Indicating some historical evidence he suggests that royal administrative practices during the Mughal period have been shaping the model style of life in India. "The alien rulers had to maintain their distance from the people over whom they must have absolute power. Distrust was inevitable and unlimited loyalty had to be valued most."⁵² This gave rise to a "climate of insecurity, uncertainty and distrust."⁵³

Later he employed another line of explanation which rests on the premise that "extreme poverty throws up certain requirements and expectations. In the process of coping with them, certain needs and values spring up and crystallise".⁵⁴ He labels this pattern as the *poverty syndrome*. According to Sinha

The constant threat of being gulped by the surging flood of poverty gives rise to a typical syndrome of pressing needs and values and the strategies to handle them. For example

- (a) One tends to perceive that resources are limited and a large number of aspirants are vying for them.
- (b) Hence, one must struggle to monopolise them to ensure survival and security...
- (c) One must have power in order to monopolise the resources and control those who may be or have resources.
- (d) The power has to be absolute...
- (e) Power can be maintained by mechanisms of status congruence and enhancement...
- (f) The strange thing about power maintenance in India is that in many instances it is based on renunciation, giving away, self-sacrifices, and self-denial.⁵⁵

This is a fairly powerful idea and to the extent it is valid, it is going to remain operative for many decades to come given the projection of population growth, economic development and lack of equitable distribution of benefits.

However, without waiting for the debate between the psychoanalytical, historical and economic explanations to be concluded, Sinha proposes a model of effective executive leadership for Indian conditions. It is the 'Nurturant Task Leader'.

The 'Nurturant-Task' style has obviously two main components: concern for task and nurturant orientation. The NT leader structure his and his subordinates' role clearly so that communications are explicit, structured and task-relevant. He initiates, guides, and directs his subordinates to work hard... Responsibilities are pin-pointed and areas of decision making are synchronised with them. He, thus creates a climate of purposiveness and goal-orientation.

His task orientation, however, has the motif of nurturance. He cares for his subordinate shows affection, takes a personal interest in their well-being and above all, is committed to their growth.⁵⁶

Sinha also proposes that the NT style, when practised for sometime, would prepare the subordinates for the Western democratic idea of participative management. Experimental studies are cited in support of this proposition. But on the whole Sinha consider the NT style as a tentative model which needs further study.

Sinha's theory has an unmistakable Indian flavour. Dayal and Sinha start with similar inferences about the operating needs of the Indian subordinate. But while Dayal has focused more on developing the appropriate structures, Sinha has focused sharply on the interactional requirements between the superior and subordinate. In this sense the two emphases complement each other. Both have attempted to bring in some features of the Indian family into the organisational structure and relationships. In that sense both are trying to address the needs of the familial 'self'. Both also seem to be holding the hope that soon enough scientific-rational democratic approach would become dominant in work organisations. They also seem to hold the assumption that when the employee reports to duty, he carries an autonomous self which is only waiting to be engaged by the task and relationships at work. They fail to take into account the familial 'self' which may have strong anchors in the family which are person specific and may act as strong pulls away from the work organisation.

Recently Sinha⁵⁷ has gone beyond the superior subordinate relationship. Based on his understanding of Japanese culture and management, he feels that generation of 'competition between' organisations could lead to co-operation within. Hence if competition could be encouraged and organisations held responsible to remain viable, it would "make people shift their loyalty to work groups without changing their ways of relating with each other".⁵⁸ Without ignor-

ing the persistent pressures for local, regional, and national identities, Sinha is optimistic about such a market-oriented strategy. It is an idea worth consideration for public policy-makers and organisational top managements.

In his latest writings Sinha^{58(a)} has started taking cognisance of the spiritual aspect also. However, clear linkages between the spiritual self and organisational realities are yet to be delineated.

UDAI PAREEK

Pareek⁵⁹ is another organisational psychologist who continues to be concerned with the issues of societal culture and its linkage with organisational behaviour. He has cross-cultural experience of research, teaching, and consulting. His view is that "each culture has its strengths and weaknesses, functionality and dysfunctionality for developing modern organisations. While designing an organisation or a system in an organisation, we can build on the existing strengths, further reinforce these strengths and use the positive aspect of the culture for organisation designing."⁶⁰

He goes further,

In the Indian context, for example, organisations should make sure that such positive qualities of the Indian cultures as concern for others, tendency to harmonise and synthesise various points of view, positive regard for different points of view, and general respect of knowledge and expertise are properly used while designing systems. For example, instead of promoting individual competitive spirit in the organisation, a spirit of collaboration may be developed.⁶¹

Pareek has neither suggested any specific design features nor suggested any preferred leadership style. However, his general approach to the problems of organisational effectiveness can be inferred from his practice. He has remained a major proponent of the human process oriented organisation development (OD) which takes the organisations to an OCTAPAC culture, where OCTAPAC stands for openness, collaboration, trust, authenticity, proactivity, autonomy and confrontation. He has developed numerous OD interventions to develop such a culture. He strongly believes that work organisations can become agents of change in the society at large.

Pareek has further conceptualised his approach in his work with the ministry of health in Indonesia. Detailed documentation of this effort is not yet available but it is mentioned as the "four fold model S-P-S-T (structure-process-strategy-tactics)"⁶²

The underlying principle of such an intervention is to respect and use some positive aspects of the culture, and modify the dysfunctional aspects through structural changes, information system, temporary systems, communication system, reward system and linkage building, through incremental planning, action research, modelling process and so on.⁶³

In this brief description he conveys a sense of satisfaction with the model as applied in Indonesia. More detailed descriptions would be worth looking forward to.

Unfortunately, in India there is no tradition yet for rigorous reporting or study of OD interventions. Their increasing popularity could be taken to be a partial indication of their appropriateness. Spread of training based on humanistic behavioural science, of which Pareek is a major proponent, could be another indication that people are liking such humanisation process. Usually participant reactions immediately or soon after the training do suggest that they find it personally, as well as organisationally useful. Some studies report direct benefits to the employees' family life. But long-term follow-up studies are not available to tell about how short-lived such euphoria may be. If psychological 'self' is a deeply embedded structure in the human being a change through behavioural training may not last long. If OD intervention brings out some cultural change in the organisation in the direction of satisfying the familial 'self' it may become as effective as the recommendations of Dayal and Sinha. Application of OD with unionised employees is beginning to show up.⁶⁴ That would be an even better ground for testing the appropriateness of OD in Indian context.

So far as the spiritual aspect of Indian psyche is concerned there is one major contributor to formal management thinking in incorporating this dimension. As mentioned earlier S. K. Chakraborty is making a very vigorous effort to unearth insights from ancient Hindu thought relevant for management of modern organisations.

S. K. CHAKRABORTY

A very recent effort to develop a uniquely Indian approach to management thinking and practice is that of S. K. Chakraborty.⁶⁵ It is important to take a look at his approach because it represents the most systematic effort to resurrect the ancient Hindu wisdom for use in managing modern day organisations. It is not that the ancient Hindu wisdom available in scriptures did not have a religious dimension to their lives but so far formal academic management thought has tended to be scientific/rational as indicated by the major Indian explorers of such culture-specific terrain in the previous sections.

India can boast of a large stock of spiritual and religious scriptures. The most ancient of these have been sub-divided into two categories 'rita' and 'smritis'. The former mainly consist of the Vedas and the Upanishads. The latter are larger in number but the Puranas and the Manusmriti are the most well known. The former contain more abstract and universalistic ideas about the cosmos and human existence. The latter contain more contextual material prescribing social conduct. Chakraborty has based his exhortations on the former.⁶⁶

He, however, is not oblivious of the

realities of human behaviour in Indian organisations.⁶⁷ He acknowledges poor work ethic, poor team work, selfishness, etc., as prevalent. Vedantic philosophy also admits of such manifestations in the lower self. But there is lesser clarity, as to why Indian organisations ought to fail so badly while we can boast of the most sublime philosophy. He offers three possible explanations.

- (a) An unfortunate experience of several centuries of alien domination and political slavery which has fostered the deep rooted plant of selfishness, a common malady afflicting all politically enslaved communities, e.g., the negroes in America. The psychic ripples of this prolonged spell in the collective subconscious of our people cannot disappear in just four decades.
- (b) Planned pursuit of rapid material advancement since 1951 has further fanned the flames of selfishness—the more economically better off one, i.e., the more selfish one tends to be.
- (c) The higher the level of one's educational attainments and societal status, the stronger seems to be the right claims orientation of that individual and the weaker the spirit of duty and obligation.⁶⁸

But in his scheme of things it does not really matter as to which is the more valid explanation. Since all the ills of the manifest reality are rooted in the ignorance of the lower 'self', the reversal can be initiated by intellectual understanding and more importantly through regular practice of meditation.

Chakraborty also explores the psycho-philosophical concepts of Indian thought and suggests that some of these such as the 'guna' theory of 'Samkhya' could be more appropriate for Indian context than the ones borrowed from the West such as that of Abraham Maslow. An interesting example where his preference is consonant with the familial 'self' is that of the Vedic idea that when a human being is born he begins with a five fold debt.

This leads him to suggest a 'giving model' of motivation rather than the 'needing models' suggested by Maslow and other western psychologists. He also cites interesting even if inconclusive evidence about this.

In addition he cites three other types of evidence to suggest the feasibility of Vedantic approach to grapple with the human problems of modern Indian organisations. The first are the letters from those students and executives who start practising meditation. Positive results reported are consistent with extensive medical and psychological Western research on meditation. But less available and more crucial evidence needed to support this approach is to demonstrate that it leads to improve organisational functioning. Though as indicated earlier, Japanese organisations have integrated religious-spiritual elements

into day-to-day functioning of organisations, the significantly different psychocultural reality of Japan does not make it easy to reduce the results from there to India. Chakraborty has instead drawn from two organisations of the past and one existing organisation as examples of the feasibility of the Vedantic⁶⁹

These three organisations are (i) the 'sreni' or the guild for secular economic activities the Vedic period, (ii) the 'sangha' for the spiritual life—the Buddhist period, and (iii) the Ramakrishna Math/Mission—since the end of the 19th century. Chakraborty uses the first of these to mainly establish the existence of well managed corporate activity in the Vedic period. His citations from R. C. Majumdar's work, however give no indications that the management of these guilds was based on Vedantic philosophy.

The Buddhist 'sangha', according to Chakraborty managed itself through 'sanghakarma' process which was characterised by joint deliberation, equality of all members in decision making on matters of common concern, the rule of majority, the rejection of personal dictation, etc. The University of Nalanda with a number of resident scholars, anywhere between 3 000 to 10,000⁷⁰, is also cited as the culmination of Buddhist style of management.

Coming to the contemporary example of Ramakrishna Math/Mission Chakraborty cites extensively from the writings of its founder Swami Vivekananda. The citations show Vivekananda's awareness of the dysfunctional aspects of the social psychology of India ("Jealousy is a national sin with us"), the mixed blessing any organisation is ('organisation has its faults, no doubt, but without that nothing can be done'), and pragmatism in the midst of spiritual pursuits ('you need a little business faculty'). The profuse quotations very well establish the managerial philosophy of Vivekananda and its closeness with Vedantic philosophy. Unfortunately no scientific account of the internal dynamics of this interesting organisation is available. But my personal impressions about the working of the Ramakrishna Mission persuade me to believe that there is something interesting to learn from it as suggested by Chakraborty.

Unfortunately Chakraborty's use of the example 'sangha' and Ramakrishna Math/Mission are somewhat weak models for a modern business organisation. As Etzioni⁷⁰ has convincingly argued religious mission oriented organisations would evoke a very different motivational dynamics as compared to commercial organisations. This is where Chakraborty's consulting experience with a business firm is the closest to the problem of operationalising the exalted Vedantic philosophy into management philosophy and practices of a typical firm.⁷¹

Chakraborty provides a candid account of the educational effort made by him with the chief executive of a business firm in

Calcutta and the team of his top managers. From the description given the effort appears to have focused on cognitive inputs on Vedantic philosophy, practice of meditation and personalised counselling. Though the chief executive seems to have changed in his style his key divisional executives have generally rejected the approach. Evidence about any change in organisational dynamics is very scanty and the reading of the case has left me with the overall feeling that the effort until 1986 (starting from 1983) did not show any signs of proving the viability of the approach.

Perhaps it is too early to evaluate the potential of Chakraborty's approach rooted in the most exalted Indian philosophy. But it might benefit by looking at the real along with the cultural ideal. Alan Roland as mentioned previously has pursued the theme of spirituality and transcendence while studying the Indian psyche even though such a theme has been more often looked at in a reductionist way in all the major schools of psychoanalysis. As stated earlier Roland had found that it was impossible to progress in psychotherapy of a number of his Indian clients without accepting the spiritual aspect of their selves.

Before specifying Roland's finds let us list the varied characteristics found to characterise religions around the world. The list does not propose a 'necessary and sufficient' kind of enumeration but is found useful in the study of religions. The "religion making characteristics" are as follows:

- (i) Belief in supernatural beings (gods)
- (ii) A distinction between sacred and profane objects
- (iii) Ritual acts focused on sacred objects
- (iv) A moral code believed to be sanctioned by gods
- (v) Characteristically religious feelings (awe, sense of mystery, sense of guilt, adoration) which tend to be aroused in the presence of sacred objects and during the practice of rituals and which are connected in the idea with the gods
- (vi) Prayer and other forms of communication with gods
- (vii) A world view, or a general picture of the world as a whole and the place of the individual therein
- (viii) A more or less total organisation of one's life based on the world view
- (ix) A social group bound together by the above

With this list in mind if one looks at everyday life in India it is more than obvious that India is a very religious society though scholars like Sinha, Dayal and Pareek have ignored this aspect. Secondly it can be noticed that it is rare to find individuals who pursue the Vedantic ideals in their everyday religious life. Looking at religions in a comparative way the *Encyclopaedia of Philosophy* goes on to state that "Buddhism and philosophical Hinduism are predominantly mystical, Judaism, Islam,

and Confucianism are primarily prophetic; and popular Hinduism, in company with all polytheistic and primitive religions, is primarily sacramental."⁷² Further examining the potential conflict between modern science and religion, it finds that

Esoteric (advaita) Hinduism is probably immune from scientific criticism, since its doctrine is on such a transcendental metaphysical level that it has no contact at all with the empirical level. However, such a form of Hinduism is perhaps more a form of metaphysics than of religion. In taking part in religious observances the devotee must abandon his austere metaphysics of non duality in favour of a pluralism of god or gods and worshippers. In other words, he must return to the phenomenal level of maya.⁷⁴

Chakraborty's problem of applying the Vedantic philosophy to the conduct in a business firm begins to be visible through this brief critique of Hinduism.

Roland's preliminary peep into the psyche of his middle class Indian clients provides a grounded view of the operating religiosity in Indian psyche.⁷⁵

For him

The interrelationship between the Indian familial self and the spiritual self is psychologically far more complex and paradoxical than meets the eye. The spiritual self simultaneously encompasses both continuity with and counterpoint to various aspects of the familial self. Hindu thought recognises the psychological phenomenon or experiential duality of the phenomenological self ('jiva-atman') particularly in the everyday consciousness of I-ness ('ahamkara') versus the inner experience of spirit or atman. Further the fundamental goal of all relationships and living is the gradual self-transformation toward finer and subtler qualities and refined aspects of power in the quest for self-realisation. Thus my paradoxical assertion that the spiritual self is simultaneously on a continuum with the familial self and in counterpoint to it spells out psychologically both the Hindu monistic position and the dualistic experiential one.⁷⁶

Like Kakai⁷⁷ Roland sees the basic progression of Indian spiritual ideal as the movement from involvement in the family life to a detachment from it and attaining union with the supreme being. But his data from psychoanalysis is more consistent with the idea of popular Hinduism as suggested in the quotations from the *Encyclopaedia* cited above. Three such features found by Roland are "(1) a mythic orientation to everyday relationships, (2) a magic cosmic involvement with destiny and (3) the practice of a wide variety of rituals frequently associated with both myths and magic cosmic correspondences."⁷⁸ Looking at the clinical material one further discovers that the utilisation of such spiritual proclivities is made mostly for personal or familial gains such as knowing the destiny in personal life, knowing the prospects for marriage, making choices for personal or children's careers,

overcoming the sickness of a relative, etc. Only one patient, an engineer turned novelist, was in the process of developing and utilising his "literary-meditative or spiritual side of himself in his work"⁷⁹ with the help of a scientist-astrologer mentor.

Hence though the vedantic ideal of renunciation from the 'maya' continues to exist as an ideal for most of Indians most of their lives are spent in the form of familial-'jati' 'self', spiritual 'self' becoming a source of strength, assurance and inspiration to pursue everyday life of a family member. In other words Vivekananda and his 'gurubhais' (brother-disciples) are likely to be found only amongst those who have already renounced worldly pursuits. Such could be the obstacle in the way of Chakraborty's spirited experiment with the business firm mentioned above. Rastogi's (1988) recommendation for a spiritual-productivity culture for India has yet to find an operationalised illustration in the similar vein.

WHERE DO WE GO FROM HERE?

We have covered the ground of some basic differences in the nature of Indian psyche as contrasted with American and Indian psyche. This was done keeping Roland's psychoanalytic research as the main ground supplemented with other material. Keeping in view the focus on the context of work organisations in the paper let us summarise the main problematic features.

(1) Contrasted with Japanese, Indians have very little identification with the work organisation and the work group therein. While the American, being an individualist, would draw meaning from his own work and the Japanese from his belonging to his work group and his contribution the Indian would much more largely draw meaning from the state of his familial relationships.

(2) The problem gets compounded because while the Indian contains his aggression in familial settings, due to his non-allegiance to work organisation, displaces the suppressed aggression in the work settings outside the family, the Japanese continues to contain aggression in the work setting and the American puts it in the service of his individual achievement but the Indian would experience much less of the either. Hence there is a greater potential for sub-optimal performance, malingering, sabotage, and even outright violence in Indian work settings.

Hence the unique Indian challenge of integrating individual with the organisation is that of creating salience of relationships at work, increasing emotional identification with the work groups and work organisation. Finally it should lead to not only the containment of the aggression which does not belong to work settings but to channelise the energies for the achievement of publicly held organisational mission, purposes, goals and objectives.

Having covered the ground of some very basic differences in the structure of psyche between India and America on the one hand, and India and Japan on the other, the next substantive questions would naturally be: given the uniquenesses of Indian personality, is a uniquely Indian model for managing the human side of Indian organisations possible? What would be the directions for building such a model? But before embarking on that uncertain and daunting task let us summarise the imperatives that emerge from the foregoing analysis. I see three such major imperatives:

First is the recognition of the familial-'jati' 'self'. It basically means that in the Indian psyche the secular work organisation does not have a place of very little significance. Hence the first challenge would be to make work organisation more salient in the mind of an employee.

Second is to acknowledge the special interpersonal emotional expectations that Indians bring to the hierarchical relations in work organisation. What complicates the matter is that they bring these emotional expectations of nurturance, and even indulgence in the frame of mind in which organisation lacks salience. The imperative can be rephrased, as it has been done by Dayal and Sinha, in terms of interpersonal aspects of leadership between superiors and subordinates. The challenge is really daunting because most of the middle level superiors too carry the same expectations—fulfilling which is next to impossible and they transfer their frustration downward rather than containing it. In other words it is the challenge of containing the irrelevantly displaced aggression by superiors as well as subordinates and challenging the energies for productive purposes.

The third imperative is non-secular in character and hence not easily tenable. But its neglect, I believe, can only be at the cost of real optimisation of mobilising human potential. It is the neglect of the spiritual or transcendental dimension of the Indian psyche in the design of structure, systems and practices. As illustrated, Japanese organisations have succeeded in creating integration between the religion and work organisation; in the West also the thesis that the Protestant ethic has made major contribution to the success of capitalism has been widely held even if questioned as an insufficient explanation. Fortunately for Japan as well as America, they did not have to contend with multi-religious multi-'jati' populations with such strong affiliations as are found in India. This imperative calls for addressing those issues which have been kept out of explicit discussions on organisation design.

By now based on the foregoing analysis, it should be somewhat obvious as to why it would be impossible to replicate either the American success with American management techniques or the later Japanese success with Japanese management practices: American techniques would not give

corresponding results because for the Indian his job and work organisation does not have the same salience; and the Japanese methods, though appealing to the familial 'self' of Indians, would be very difficult to implement in their spirit because managers as well as their subordinates would be disinclined to give sufficient emotional salience to the work group and work organisation. This is not to say that there is no hope for Indian organisations. It has been shown that Indian socio-cultural reality is not antagonistic to industrialisation or modernisation.⁸⁰ But what needs emphasis is that beyond a point absence of antagonism fails to provide sufficient force for dealing with the challenges of societal development in an increasingly competitive world. Positive forces need to be generated to meet the challenge of an increasingly organisation based society.

SOCIAL STRUCTURES OF INDIAN VILLAGES

A Study of Rural Bihar

HETUKAR JHA

Society is a complex whole comprising of many and varied layers. Hence, understanding society can be problematic as perceptions often tend to be lopsided and incomplete. Prof. Hetukar Jha has chosen to analyse the forbiddingly complex society of rural Bihar. He bases his study not only on survey data but on historical records, particularly the 'village notes' which were prepared at the beginning of the century.

The author concentrates on the model styles of relationships constituting the 'primary level structures' of villages. These structures are constituted by such institutions as family, share-cropping, money-lending, upper class and lower class relationships and *Jajmani* relationships. The expectations typifying the roles of each of these groups have been explored and analysed. Regional variations as well as variations in the nature of villages are significantly reflected in the styles of relationships studied.

The book will be of interest to anthropologists and sociologists as also those engaged in rural development

Roots of Present Communal Crisis

Victor S D'Souza

Due to the peculiar geographical distribution of religious minorities they on the whole do not pose a serious political threat to the majority community except in some peripheral regions. Why then has the movement for building up Hindu nationalism gained currency in recent decades?

IN order to understand the tension-laden religious situation in our country, or for that matter anywhere else in the world, we should take note of the basic dilemma in religion. The dilemma lies in the fact that what religion aims at is largely at variance with what religion is often used for.

Religion is essentially intended for personalising the spiritual experience of its founder or founders. Its purpose is to resolve fundamental problems faced by the individual such as the meaning of life, salvation after death, the causes of suffering, release from anxiety and so on, with the aim of realising inner peace and harmony. Although religious experience is essentially an individual phenomenon, its realisation calls for the building up of a religious fellowship or religious group. Now, it is in the nature of a social group that once it is brought into being, it can be used for the fulfilment of ends other than those which brought the group into being. This applies to the religious group as well. What is more, the loyalty of members in a religious group is far stronger than in many other types of groups. It is because the bond that ties members of a religious group is derived from their relationship with the same sacred object or being, it sacralises the self-identity of the members as well as the identity of their group.

That being the case, if the interests of the group members or of a section of the group were couched in a religious garb, the members could be persuaded to lay down their lives for the cause irrespective of the true nature of those interests. In this manner, religion which is a faith aimed at the fulfilment of spiritual goals can be rendered into an ideology for the fulfilment of material and political goals. Thus the dividing line between faith and politics is very thin.

In examining the historical contexts of the religious communities in India which

can be linked with their present situation attention has to be focused upon the Hindu religion which is the most ancient and has the largest following. Unlike some other major religions which are well defined by their founders, Hinduism is a syncretic and evolving religion in which several different perspectives co-exist. Because of the syncretic character of Hinduism other religions born in India have to strive hard to maintain their separate identities. Among Hinduism's different faces, two, with contradictory features, may be recognised for the present purpose. At one extreme we have the Varnashrama Dharma known simply as the Varna Dharma in ancient times, and at the other extreme we have the Manava Dharma. Whereas the Varna Dharma emphasises the principle of dominance enshrined in the caste system, Manava Dharma affirms the principle of universal brotherhood which has influenced the peculiar brand of secularism in India, which enjoins equal respect for all religions. However, in all the Hindu religious perspectives, the leadership, by and large, is derived from the upper castes, especially the Brahmins.

The religious configuration that can be seen in India today is greatly influenced by the Varna Dharma which owes its origin to the advent of the Aryans in India some 3500 years ago. Among the outsiders who came to this country such as the Aryans, Greeks, Sakas, Huns, Arabs, Turks, Afghans, Mongols and the Europeans, and who had a role in shaping the political, social and cultural destiny of the country, none held greater sway over its culture and society than the Aryans. The success of the Aryans lay in the fact that they were able to forge a social order of domination, which they sacralised by the creation of a religious ideology, both of which they were able to disseminate into the subcontinent through their political

power.

Because of their superior fighting power, the Aryan hordes coming from Central Asia defeated the people of the Indus valley even though the latter possessed a superior civilisation. But what really set the historical course of the Indian society was their establishment of a permanent dividing line between the victorious Aryans and the defeated non-Aryans, which was the basis of the Varna system.

The Varna system, as the term implies, was originally a distinction of colour or race. The manifest racial distinction, however, got diluted because the invading Aryans being short of women, forcibly married the women of their enemies who were racially different. But they preserved their identity by their patriarchal domestic system and by establishing the institution of hypergamy which reserved the privilege of marrying outsiders only to men who could even have a plurality of wives. That, in this process the status of women in the Aryan society deteriorated, was another matter.

It is well known, how, over a thousand years, the Aryans spread over the Indo-Gangetic valley, built a civilisation of their own, evolved the Vedic-Brahmanic religion, and established flourishing kingdoms. The Aryans were a pragmatic people. Nothing mattered to them more than perpetuating their supremacy. In order to make their religion and culture acceptable to others they assimilated indigenous elements. They successfully neutralised the challenges of protestant religious movements such as Buddhism and Jainism by incorporating some of their lofty ideas into the Brahmanic religion. Above all, the groups which posed a political and economic threat to their dominance were co-opted into the dvija varnas (Aryan groups regarded as twice born) of Kshatriyas and Vaishyas, the Brahmins remaining at the apex of the Varna system.

Whereas at the height of its maturity, the Brahmanic religion enunciated profound principles of ethics and spirituality, because of the concern for the Aryan dominance, it has not been able to uphold these principles as being superior to the worldly way of life, and in practice subordinated the former to the latter within the scheme of Varnashrama Dharma. In doing this, the socially exclusivist and inequalitarian Varna system was sacralised by making it an essential element of the predestination theory of Karma, and link-

ing it with one's salvation. The existing divisions in society were integrated into the rigid hierarchy of the Jati or the caste system.

Because of the dominant influence of the dvija castes, the caste system, besides forming the structural basis of the Brahmanic religion, got itself ingrained into the social, political and cultural systems, so that later on, even those who renounced Varnashrama Dharma or who came from outside the country, succumbed to the caste system. Thus social exclusivism and inequality became the accepted values in the Indian society.

The religion of Varnashrama Dharma brought about a unity in diversity in the multi-ethnic society in India, mainly through the domination of the dvija castes, but because of its commitment to the rigid caste system, it could not weld together the Indian population into one people. Originating from the fertile plains of the Ganges, Aryan influence spread throughout India, but has passed through many vicissitudes, its greatest challenges coming from the protestant religious movements of Buddhism and Jainism, and later on from Islam and other religions. The onslaught of Buddhism and Jainism came from within Hinduism itself, and from its heartland. These religions are regarded by some scholars as being essentially the revolts of the Kshatriyas and the Vaishyas among the dvija varnas themselves against the growing hegemony of the Brahmins, but because of their more egalitarian teachings the protestant religions, especially Buddhism, became counter-magnets to the lower castes who were groaning under the oppressive Varna system. However, within a few centuries, Hinduism was able to digest these new religions by incorporating within itself some of their popular beliefs and practices, and in the end a more reformed Hinduism staged a resurgence with renewed vigour.

Whereas the major protestant religions such as Buddhism and Jainism arose from within Hinduism, other major religions such as Islam and Christianity came from outside, and whereas the former category of religions occupied the strongholds of Hinduism, the latter category found its foothold in the peripheral areas. Although great religious missionaries have laboured for the spread of Islam and Christianity in India, these religions came especially as camp followers of foreign traders and invaders. The foreign rulers found it expedient to raise a community of followers of their own faith so as to create a local support base, and people who were

underprivileged in the Hindu caste system readily accepted the new faiths in order to escape from their miserable conditions of life as the new religions offered the prospect of exalted fellowship and political patronage. The spread of new religions coming from outside is a case of indistinguishable blend between faith and politics. All the same, these religions swelled their ranks with converts mainly from the western, eastern and southern regions of the country, where the dominance of the dvija castes was relatively weak. Even Islam whose rulers had an absolute political sway over the country with their capitals in northern India had only modest success in making conversions in the heartland of Hinduism.

The conversions to Islam and Christianity have had a chequered history, as they took place under the patronage and sponsorship of different ruling powers and trading companies, which were operating in different parts of India and at different points of time. These historical circumstances surrounding the conversions and the fact that their sponsors, even those who belonged to the same religion, came from different countries, sects or churches, explains why, very often, the followers of the same religion but belonging to different sects and churches, are spread in mutually exclusive regions. Thus the Muslims of the east and west coasts of India who were converted by missionaries who accompanied the Arab traders belong mostly to the Shafi'i school of Islam, and the Sunni Muslims who were converted under the patronage of Muslim rulers are widespread in the rest of the country. Similarly among the Christians, the Syrian Christians converted by the early foreign traders are concentrated in Kerala, the Roman Catholics who were converted by the Portuguese and the French are overrepresented in the east and west coasts, and Protestants who were converted especially during the British period have their pockets of concentration in the north-eastern and north-western parts of India.

Because of this historically determined pattern of distribution, people belonging to the different churches and sects even though they may belong to the same religion, rarely come face to face with each other in the same region. Interestingly, a similar situation prevails as regards the geographical location of people belonging to the different minority religious groupings. That is to say, when we consider the larger minorities such as the Muslims, Christians and the Sikhs, we find that the concentration of a particular minority in a region is mutually exclusive with the

concentration of other minorities. Even in Kerala where the Muslims and the Christians are found in large proportions, each religious category is concentrated in a different part of the State.

The peculiar geographical distribution of religious minorities has significant consequences. To indicate a few: First, even though a minority religious grouping is relatively small at the national level, because it is found in pockets of concentration, wherever it is located, it constitutes a significant cultural entity. Second, because of their mutually exclusive locations in different regions, the minorities do not have common economic interests in order to combine themselves politically at the national level, and third, in any given region the majority religious category has to deal with only one minority religious category.

Shorn of their political patronage which existed in the past, and with a geographical distribution which is hardly conducive to political mobilisation, the minorities on the whole do not pose a serious political threat to the majority religious body except in some peripheral regions where the minorities at the national level are majorities at the regional level. Why then has the movement for building up Hindu nationalism gained currency in recent decades? Further, why is this movement directed against minorities, especially in northern India, who are not secessionists?

Hindu nationalism as a positive concept aimed at bringing about solidarity in society which is fragmented with socially exclusive and inequalitarian groupings would be a welcome step in keeping with the democratic aspirations of our people. But what is advocated by the proponents of this movement is the chauvinistic idea of the empowerment of the majority community *vis a vis* the minorities. It is obvious that efforts at increasing the strength of the Hindus to take on the minorities which are already weak is like flogging a dead horse. The empowerment of the majority religious group which sanctions exclusivism and inequality, could have only one aim, and that is to perpetuate the dominance of the upper castes. The fact that the inspiration for this movement comes from some of the members of the dvija castes, who are also actively engaged in its organisation, lets the cat out of the bag. It inevitably links this movement with the traditional Aryan domination of the Indian society achieved through the ideology of Varna Dharma.

For an elaboration of this point of view it is also necessary to take into account the linguistic situation in the country, for,

the influence of the Aryans on the indigenous religions of India is paralleled by their influence upon the languages of the country. Being most successful in developing a learned tradition which they assiduously safeguarded for their own advancement, the Aryans nevertheless were able to influence many Indian languages with their Sanskrit, especially in northern India. In the region of their domination many different languages have converged in the form of Hindi, while their original differences are now regarded as dialectical peculiarities.

Having its epicentre in the fertile plains of the Ganges, the Aryan influence easily spread in the surrounding areas of the northern and central India. Its penetration into southern India was somewhat restricted by the intervening mountain ranges so that the Aryan impact on the culture, religion and languages of south India is far less. Accordingly the influence of Sanskrit upon the languages of southern part and other peripheral areas of the country has not been able to affect the separate identities of these languages.

As a result of the interaction among the racial, socio-political and cultural forces in their historical context, the social structure of India in terms of ethnic factors constitutes a peculiar geopolitical configuration which becomes meaningful when seen from the perspective of Aryan domination. We may consider the religious and linguistic patterns of this configuration.

Religionwise, although the overwhelming majority of the Indian population is referred to as Hindus, because of its syncretic character the brand of Hinduism followed in different regions varies. When Hindus of one region settle down in another, they feel the need to set up their own separate place of worship. By and large, the Hindus of northern India more influenced by Aryan culture form the central and the largest Hindu block popularly referred to as the cow belt, and the other regional groupings are peripheral to this block. This pattern indicates a centre-periphery relationship in Hinduism itself, although the growth of Hinduism at the centre was somewhat stunted by the political domination of the Muslims for a long time.

When we consider the geographical distribution of the various religions including Hinduism, we also find a centre-periphery relationship. In this case the Hindus are over-represented in the northern and central regions and the minorities are over-represented in the peripheral areas.

Corresponding to religion, there is also a linguistic differentiation between the

centre and the periphery. Whereas relatively Hindi speakers preponderate the northern and the central regions, the speakers of hundreds of other languages are scattered on the peripheral regions.

A remarkable feature of the religious and linguistic patterns of distribution is that whereas the overwhelming majority of the Hindi speakers are Hindus, the overwhelming majority of the people belonging to the non-Hindu religions speak non-Hindi languages. It is also strange but true that instead of trying to strengthen the link between Hindi and the other Indian languages, conscious efforts are made to Sanskritise Hindi even more, so as to rejuvenate its Aryan connection. At the same time, since the Hindus who speak Hindi occupy a central location in the country, there is a tendency to project their dominance beyond their region by identifying Hindi and Hinduism with Indian nationalism. Again, it is some of the members of the dvija castes who feel their dominance threatened by secular and democratic values, who are prominent among those who are trying to give a practical shape to this thesis. Understandably they are also prominent among those who advocate a more centrist approach rather than a federal one, in Indian politics.

Let I should be misunderstood on the language issue, I should like to enter a *caveat* at this point. A common language, apart from the language of the different groups, is a must for any country for its efficient functioning, irrespective of its form of government. So also our national identity calls for the adoption of an Indian language for this purpose; and no other language qualifies better than Hindi to perform this role. But what is objectionable to the present arrangement is the way in which Hindi is cultivated; instead of trying to link it with the present Indian languages, laborious efforts are made to link it with Sanskrit which is not only a language of the past but also the language of the dominant minority at that time. The preservation of the past treasures of our culture is one thing, and their imposition on the present people is another.

Hindu nationalism as it is popularised today is unmistakably a chauvinistic movement which can be sustained only by negative tactics. One of these tactics is to create an enemy of straw and then to burn it. The minorities come in quite handy for this purpose. The fact that some of them share a common religion with former foreign rulers becomes an evocative reason for making the minorities scape goats in the eyes of the unsuspecting Hindus for their frustration due to the humiliation which their ancestors might have experienced on account of foreign rule.

However, it must be said to the credit of the dvija castes that if one section among them drawing their inspiration from the traditional perspective of Hinduism is pursuing the path of dominance, some other section, in keeping with the more evolved form of the same religion is committed to the secular democratic ideal. Having been at the vanguard of the freedom struggle, the latter section was instrumental in the adoption of a secular-democratic constitution for the country after independence. It must however be admitted that for various reasons, this section has not been able to put its heart and soul into the task of bringing about a transformation of the society as envisaged in the Constitution, thus inviting upon its policy the opprobrium of pseudo-secularism. Nevertheless, the stand that it has taken has the merit of focusing on the need for a radical transformation of the Hindu society. The advocates of Hindu nationalism, on the other hand, only contribute towards obfuscating this issue.

In a country in which more than four-fifths of the population is made up of Hindus, it would be the Hindus who would always wield effective political power no matter what form of a political constitution we would have. The struggle for power cannot be between the Hindus and the non-Hindu minorities, but between groups of Hindus themselves. Therefore if we delve below the surface, it would seem that the call for Hindu nationalism is a ploy employed by one section of Hindus to dislodge another one from power. In this game of power the hapless minorities are made a pawn.

In a broader sense, the concept of nationalism is based on the idea of the unity of mankind, and in a narrower sense, it refers to the unity of a cultural group; the latter idea is derived from the former. Viewed in this light, Hindu society which is badly fragmented due to its traditional values of social exclusivism and inequality, indeed, needs a nationalist transformation. But for cultivating true nationalism in a positive way, the Hindus have to turn their zeal and energy within their own society and not outside.

Labour Process and Characterisation of Small Industry Sector

Sucha Singh Gill

The Political Economy of Unorganised Industry: A Study of the Labour Process by Manjit Singh, Sage Publications, New Delhi, 1990, pp 234, Rs 190

THE agrarian situation in Punjab has attracted the attention of a large number of scholars in India and abroad due to the predominance of agriculture and allied activities in the economy of the State but primarily because of the fast transformation of agriculture, making the State the most important centre of green revolution in the country. The focus of scholars on the agriculture of the State has been two fold. First to understand the Punjab experience and the factors behind quick changes so that the same experience could be repeated in other parts of India and in the developing countries of South Asia. Second to understand the nature of these changes and its social and political implications. Greater stress on agrarian studies has distorted, to some extent, the picture of the State's economy and the impression has been created that there is little development in the industrial sector. In fact the rate of industrial development from 1966 the year of reorganisation of the State, has been higher than that of agriculture. The share of manufacturing in terms of employment has increased from 11.32 to 12.55 per cent between 1971 and 1981.¹ The share of this sector in State domestic product at factor cost at constant prices has increased from 8.15 per cent in 1970-71 to 11.42 per cent in 1987-88. In the context of relative paucity of studies of the industrial sector, particularly on labour processes and the level and mode of surplus extraction Manjit Singh's book is a very useful contribution. The focus of this work is to understand and characterise the stage of organisation in unorganised industrial sector its effects on the structure and composition of working class, its class consciousness and organisation of the trade union movement.

Marx's concept of labour process has been used to explore the nature of production organisation. Marx defines labour process as 'human action with a view to production of use values, appropriation of natural substances to human requirements, it is the necessary condition for affecting exchange of matter between man and nature'.² There are three elementary factors of labour process. They are (1) personal activity i.e. work itself (2) the subject of work and (3) instruments of labour. Labour process disappears in the product, which is a use value created out of nature's material adopted by a change of form to the wants of man. Products are the result as well as conditions of labour. Among the factors of labour process

instruments of labour have a special significance. These instruments not only supply a standard of the degree of development which human labour has attained but are the indicators of social conditions under which labour is carried on.³ Labour process exists under all social conditions and its nature's imposed condition of human existence. Labour process takes different forms under different social conditions.

Marx has analysed in depth the labour process under the capitalist system of production. Under these conditions labour process exhibits two characteristics. First, labour works under the control of the capitalist so that work is properly done without unnecessary waste of raw materials and wear and tear of implements. Secondly the product is the property of the capitalist and not that of the labourer.

The main concern of Manjit Singh's study is to analyse the labour process in the unorganised industrial sector of developing countries like India. It has been defined by some common features such as smaller size of production units scattered over a wide area, use of lower levels of technology with high labour absorption, prevalence of piece rate wage payment and the pivotal role played by intermediaries between workers and the ultimate employer. This sector played a very important role in the industrial revolution in Western Europe and is a prominent feature of modern Japanese industrial structure. In Western countries this created an initial basis for growth of the organised corporate industrial sector. Unorganised industrial sector emerged out of the handicraft production system in the initial phase of development of capitalism in the West. In this phase it passed through three distinct forms termed co-operation, manufacture and factory (machinofacture). Manjit Singh seeks to examine labour processes in the hosiery industry of Ludhiana in terms of Marx's concepts of 'manufacture' and factory system of organisation of production. Manufacture is characterised as detail labour on the basis of skill and separation of mental labour from manual labours. This leads to loss of control of labour process by worker to capital. Factory form of production is distinguished from manufacture in terms of tools of production. In manufacture tools are operated by hand whereas in factory tools are fitted into the body of the machine operated by an inanimate source of power. This is the reason

factory system is also called machinofacture. In this system detail labour is replaced by detail machine functions. Transition from manufacture to factory took a long time and a variety of forms. It is only from the mid 19th century that factory system began to dominate in the West.

Manjit Singh points out that capitalist growth in India in the 19th century started on two different lines. On the one hand there was the imposition of modern capitalist enterprises from above and on the other hand traditional industries struggled to grow from below. In the latter case weaving industry of Surat, metalware industry of Aligarh and coir industry of Travancore are mentioned. Here artisanal production was transformed into capitalist simple co-operation or capitalist manufacture. The transition from manufacturing to factory production was very slow and partial before independence. After independence the small industry sector came to be specially protected under the Industrial Policy Resolution (1946). This sector now accounts for nearly 50 per cent of value added and 80 per cent of the total employment in manufacturing in the country. Unorganised industries are the most important component of the small manufacturing sector in the country.

On the basis of review of studies Manjit Singh classifies unorganised industries in India into four categories. First, there are home based industries based on traditional skills and instruments of labour. This form of production is characterised as 'independent artisan' or 'small petty capitalist production'. Sandal and coir industries fall within this category. The second type of industries are owned by merchant manufacturers. This resembles typically the British putting out system/capitalist domestic industries. The lace, beedi and carpet industries belong to this category. The third type of industries assume the capitalist manufacturing form. Match sticks, fireworks and agarbati industries belong to this category. The fourth type of industries has developed production process from manufacture to factory form. The four-fold classification of these industries has led to division in the ranks of working class based on part/whole ownership of means of production, sex and geographical divisions, competition, size of units and existence of chain of intermediaries. This has implications from the point of view of organising the working class. This is the reason why with the exception of the coir industry in Kerala and the shoe industry in Calcutta there is little evidence of the emergence of organised trade union movement among the workers of these industries. Any intervention by trade union movements or by the state on behalf of workers led to capital re-organisation and dispersal of production processes in such a way that this intervention could be avoided.

The case of the coir industry in Kerala and beads industry in Nepal is a pointer in this direction

Comparing the growth of industrial capital in Punjab with the rest of India the author finds that traditional industries were almost at the same level in the matter of transformation to capitalist relations of production. While industries were trying to come up from below from handicraft to small workshop and further to small factory production the capital intensive large factory industry had not made any major dent in the industrial economy of the State before partition. The process of penetration of capitalist relations in traditional industries and their concentration in various urban centres was slow compared to certain other parts of the country.

In the post-independence period industrial development of the State has been concentrated in urban centres. Urban industrial units can be divided into two distinct categories. First, the small industrial sector which employs more than three-fourths of the total industrial workforce and produces nearly 50 per cent of the value added. In the small sector, textile employed nearly 37 per cent of the workforce followed by the cycle industry (12.6 per cent) and agricultural implements and mechanical tools (10 per cent) in 1978-79. The peculiar feature of small scale industries in the State is that most of the units have evolved from the traditional handicraftsman's small workshop to manufactures and more recently to factories. The second category of industrial units is of medium and large size. Except for the engineering industry these have been imposed from above.

Ludhiana has emerged as the biggest centre of industries in Punjab employing 37.7 per cent of workers in the small scale sector and 29.55 in large/medium sector. The respective shares in total production was 23.98 per cent and 23.44 per cent in 1979-80. Among the various industries in Ludhiana district, hosiery has emerged as the biggest industry employing 40.99 per cent of the total workers and with 34.58 per cent of the production of small scale sector in the district. The author has taken this industry for in-depth analysis to understand the level and the nature of labour process in the small sector.

Hosiery industry developed mainly in the 20th century. It faced two difficulties in the pre-independence period. First, short supply of machinery from abroad particularly during crisis/war. Second, competition from established producers from abroad. In the post-independence period both the difficulties ceased to exist with sufficient availability of domestically produced machinery and control over foreign competition under the protective mechanism.

Hosiery industry of Ludhiana was transformed from natural economy to domestic capitalist production industry in the second quarter of the 19th century. Needle knitting began to be replaced with frame knitting

from 1883. Initially frames were imported from abroad but in the early 1920s production of small knitting frames was started by local artisans. This gave a boost to the process of introduction of machinery in industry. By the late 1920s there were nearly 900 frames in operation in Ludhiana, out of which 20 were power driven while the remaining were hand driven. Industry expanded in a big way during the first and second world wars due to stimulus of protected market. After partition the industry began to grow in a big way and Ludhiana not only became biggest centre of hosiery production in Punjab but also a major centre for other industries in the State. In 1951 the industry employed 20,000 workers and had 805 units out of which 56 (6.95 per cent) were registered. The industry had acquired a complex system of production and organisational pattern. But as yet the industry was seasonal in character functioning from July to December. There was a considerable increase in the use of machinery in the industry and by 1961 there were 7,700 knitting frames/machines in use in the industry. Out of these machines more than three-fourths were hand operated. Though some factory production had come into existence manufacturing continued to predominate.

This industry got a major fillip from the early 1960s when export to East European countries, especially to the Soviet Union began. Export of hosiery to the Soviet Union takes place through 18 monopoly exporters recognised since 1972-73. Trade agreements with the Soviet Union have established not only the monopoly of 18 exporters in trade but have also implications for the type of instruments of production in this industry. Soviet Union has been purchasing goods by weight. Woollen goods of heavy weight can be knit only by manually operated knitting frames. Since export orders in volume with the given number of exporters have multiplied with stagnant technology, they have no option but to submit export orders to fabricators on contract basis.

The growth of this industry was accompanied by changes in the production system. First while capitalists have withdrawn from direct control over labour process and shifted to trade, factory type composite units have been broken into tiny units based on various production processes. This has put the burden of instruments of labour on petty capitalists or grassroots workers. Big traders get their goods manufactured by simply advancing raw material to small independent units. The author characterises this type of production as 'decentralised factory system' or 'modern putting out'.

Production units in hosiery industry can be divided into four categories: (i) units producing yarn, (ii) producers-cum hosiery exporters, (iii) units fabricating hosiery units from yarn advanced by exporters, and (iv) small independent workshops providing specialised services/processes such as buttonholing/stitching, dry cleaning, linking, etc. In this chain of units, the author has studied

only two types of units. There is no mention of yarn producers; their status and link with other types has not been investigated in the study. The small independent workshops do find mention but in a peripheral way as providing services to the fabricators. Omission of these two types of units is not only intriguing but creates a serious gap in our understanding of labour processes and surplus extraction.

The study of production organisation and composition of working class is based on empirical data collected from 15 export units and 25 fabricating units. Export units are engaged both in production of hosiery goods as well in export business. The fabricators are engaged in manufacturing output for exporters. Export units are quite big compared to fabricators both in terms of turnover as well as investment in plant and implements. The author has estimated that average investment of exporting units in plant and machinery turns out to be Rs 11.22 lakh against Rs 6.4 thousand per fabricating unit.

The central concern of the author has been to locate the stage of production organisation in both export and fabricating units. On the basis of instruments of labour used by exporting units, it is concluded that the form of production organisation is predominantly manufacture. The argument advanced is that the knitting process employs more than 55 per cent of the workers in the export units where knitting is done by hand operated knitting frames. Hand operated frames are traditional instruments and are mainly owned by the workers. The author notes the introduction of new power operated machines by the big units. He also finds introduction of linking machines, buttonholing/stitching machines, cup seaming machines and power winders in the industry displacing respectively 3,180, 570, 115 and 360 women workers. In recent years computer designing has been introduced with improved knitting machines fitted with electronic control systems. At the time of the study the machine was not popular with the producers being costly, but is now entering the industry in a big way. Ignoring these moves of the industry towards mechanisation the author insists on characterising it as the stage of manufacture. Two factors are considered important for the present structure of this industry. First, Russian trading teams purchase hosiery by weight which can be produced cheaply by hand operated knitting frame. Second, due to availability of abundant supply of cheap labour producers find it profitable to employ a large number of manual workers instead of a few automatic machines.

Fabricators occupy an important position in the production of hosiery goods. They account for 45 per cent of the total production of the hosiery export industry. Fabricators perform job work of required specifications with raw material advanced by the exporters and receive the fabrication cost including a profit margin of Rs 2-3 per piece. Fabricators get the job done through the workers

employed for the purpose. Fabricators own few tools and machinery. Simple tools like knitting flats and sewing machines are owned by workers. The major burden of owning tools falls on workers.

A significant finding of the author is the emergence of the fabricator. The fabricator as a category of producer came into existence in the mid 1970s. The fabricator has emerged from two sources. The overwhelming majority of them were previously workers. Out of 25 fabricators studied 23 had been flat workers or contractors cum workers in the hosiery industry with long experience, in some cases, of more than twenty years. The other two became fabricators directly without earlier experience in this field as workers. 20 of the fabricators started work with capital financed from savings. Three took loans to augment their savings. Only one began with completely borrowed capital while another one transferred agricultural surpluses to this business. Of the fabricators 16 own working space while nine of them have hired working space.

The author reveals the following process of manufacturing by the fabricator. Normally a fabricator is required to deposit Rs 10,000-20,000 with the exporter as a security for the yarn (raw material) advanced valued at Rs 40,000-50,000. The fabricator also normally advances Rs 10,000-20,000 to workers. Thus the fabricator arranges Rs 20,000-40,000 for advances as a security to both exporters and workers and sometimes additional Rs 20,000-30,000 for payment of wages in case of non receipt of fabricating charges in time from the exporters. The fabricators perform a host of functions in conversion of raw material (yarn) into hosiery garments such as co-ordination of their own workforce in mending and knitting. They also co-ordinate independent processes such as button-holing/stitching, linking, dry cleaning and dispatching of garments, after inspecting each individual piece, to the exporters.

Fabricators are squeezed by exporters in various ways. The fabricator is paid charges for a particular design and size of a piece of hosiery which includes labour charges and his profit margin. The fabricators complained that the percentage of their profit margin had not been revised by the exporters for the last 20 years. Exporters permit only 2 per cent wastage of wool while the actual wastage reported by the fabricators is 5 per cent. The fabricators also pay a bribe of paise 20-25 per piece to the garment checker employed by the exporters.

For the emergence of the phenomenon of fabrication two reasons are assigned. First, the collective resistance of workers against their exploitation leading to a general strike in 1972 led to a decision by hosiery producers to re-organise their capital in order to avoid labour troubles and welfare obligations to labour provided under various labour laws. Secondly, to meet fast expanding export orders to the Soviet Union exporters instead of expanding their own pro-

duction increasingly relied on fabricators.

The fabricators perform most of the processes within their workshops. But processes which are capital intensive or uneconomical are accomplished through independent small workshops set up for each individual process such as button holing/stitching, embroidery, dry cleaning and linking.

It is estimated that the average number of workers employed by an exporting unit is 376. A fabricator on the other hand employs on an average 31 workers but if domestic workers (workers working at home) are excluded then the average comes down to 25. Sex wise distribution of workers indicate that the female workforce was 29.71 per cent in fabricating units and 8.50 per cent in exporting units. Nearly 5 per cent of workers in the industry are child labourers below 14 years of age. In exporting units there are two types of employment, i.e., workers directly employed by the units and workers employed through contractors with their respective share of 56.34 per cent and 43.66 per cent. Fabricating units have three types of employment, i.e., direct employment, employment through contractors and family employment with respective shares of 85.60 per cent, 6.66 per cent and 7.94 per cent. Out of 5,637 workers employed by exporting units, 4,826 (85.61 per cent) are not considered workers either by contractors or by exporters. This is because they are either employed through contractors or they are employed on piece rate basis and workers own their tools of production. Their work is considered contract work. The remaining 811 workers (14.39 per cent) employed directly by the exporters on time rate basis are not on the regular muster roll. Thus nearly 90 per cent of workers in export units and all the workers (781) in fabricating units are not on the regular muster roll and are deprived of their legal status as workers. In case of fabricators 15.74 per cent of workers, mostly women are not even working on the workshop premises of their employers but in their own houses. The overwhelming majority of workers are deprived by the production process of their legal status as workers and consequently of benefits due to them under labour welfare legislation. They are not only subject to ruthless exploitation but have been deprived of any opportunity of putting collective resistance due to the temporary and *ad hoc* nature of their employment and scattered work places.

Data collected from 491 workers reveal that the workers employed in this industry are drawn from among the residents of Ludhiana city or from other States (mainly Bihar and UP). Workers from rural and other urban areas of the State have not been absorbed in this industry. The percentage of local and migrant labour works out to be respectively 61.9 and 38.1. There is caste division among them. The percentage share of upper castes, intermediate castes, artisan/service castes and lower castes among the workers are respectively 22.61, 27.09, 34.42 and 15.88. With some variation, this caste

division is found among both local as well as migrant workers. Local workers have an overwhelmingly urban background while migrants are mainly of rural origin. This is also reflected in differences in literacy level. Illiteracy among local labour is 3.60 per cent while it is 20.13 per cent among the migrants. Local labour is concentrated in better paid processes such as knitting, mending, tailoring and pressing while migrants have been accommodated in low paid processes such as winding, stitch opening, checking, packing and miscellaneous. Similarly a high concentration of female labour is found in winding button holing/stitching, 'tripai' and miscellaneous processes.

Wages of migrant workers are generally lower than those of local workers. Their hours of work are also longer (11 hours) compared to that of local workers (10 hours). Apart from the better skill of local labourers other factor causing difference in wage rates is the mode of employment. Most of the migrants are employed through contractors. Contractors corner a margin of 20-30 per cent of the piece rates contracted with the exporters and the rates paid to the workers. Female labour is exploited more than the male adult labour. Their monthly earnings are by and large less than one half of those of adult male workers. The worst exploited are the rural domestic women workers followed by the urban domestic women workers and aged women. Most of the women are employed by contractors who siphon off 40-50 per cent of their wages. Child labour is mainly employed in stitch-opening, mending, checking and packing. Like migrant workers, child workers are employed through contractors at the manufacturing places. They work for long hours (9-11 hours). Child labour is better placed compared to female domestic workers and aged female workers. But they are more exposed to the high handedness of contractors due to lower age. They are also subjected to occasional physical beatings. Ownership of some instruments of labour by some workers has blurred the class division between the proletariat and the capitalist employer. The tendency towards mobility of workers in various industries has weakened the stability of the working class. Both these factors have negative implications for organising workers against exploitation. In fact in the present situation it is very difficult to implement labour legislation. It is found that out of the sample of 491 workers only 14 workers (two female and 12 male workers) were being treated as regular workers and were in receipt of the various legal benefits. It is a sad commentary on the implementation of labour legislation that in hosiery, the biggest industry of Punjab, 97 per cent of the workers are deprived of their legal rights. In this context the author has furnished very interesting results by working out ratios of wages received by local, migrant and female workers to minimum wages fixed by the State labour department in various processes in the hosiery industry in the first quarter of 1984.

Out of the seven processes in which local workers were employed they received less than minimum wages in four processes. Their wages were 81.86 per cent, 88.22 per cent, 95 per cent and 95.67 per cent of minimum wages respectively in mending, linking, flat knitting and checking. Only in three processes did they receive wages higher than the minimum fixed wage rate. Migrant workers were paid wages less than the minimum wages in all the seven processes in which they were employed. Their wage rate ranged between 69.94 per cent to 96.31 per cent of minimum wages in these processes. The condition of female workers is pathetic. In three processes out of four female workers were paid wages less than 40 per cent of the minimum wages. Wages obtained as percentage of the minimum wages in all the four processes was 33.43, 37.91, 31.43 and 76.17 respectively in winding, 'tirpai' button stitching and checking. This highlights the ruthless exploitation of workers in the hosiery industry on the one hand and existence of working class as a distinct identity on the other. It is difficult to agree with the author's assessment that the working class in the hosiery industry is still in the making because workers own some instruments and have a tendency toward mobility. Existence of working class as a distinct identity is in objective reality and the factors cited by the author are inhibiting organisation of the workers in trade unions. Existence of this class in itself must not be confused with class for itself.

One full chapter is devoted to the trade union movement in Ludhiana where the hosiery industry is also covered. From historical experience the author brings out the division of workers by trade unions affiliated to different political parties and their functions, emergence of professionals in the trade union movement and lumpen repressive structure of employers as factors inhibiting the trade union movement in Ludhiana. Along with these factors the production structure of the industry does not give enough scope for the emergence and growth of a trade union movement in this industry. Interesting evidence has been collected to show how legalism has given rise to businessmen and professionals in the trade union. Each major trade union has a practising lawyer associated with the union. These lawyers are also trade union leaders who make considerable money from legal battles as part of their legal practice. Emphasis on legalism has given rise to 'basta' (bag) unions, the unions run by individuals as 'mobile shops' who carry their office in their bags with union membership forms, demand notice forms and other documents needed to file cases on behalf of workers in the courts. Another type of professionals organise strikes in a particular unit in connivance with rival producers who pay adequate money as reward. Similarly strikes are organised or disrupted for making money by such individuals. They are on the payroll of the industrialists for keeping industrial

peace. Though there are silver linings in the positive attitude of some unions, legalism has been at the cost of workers' education to enhance their class consciousness. One of the ideological barriers pointed out to working class consciousness is the bourgeois propaganda that the workers, who own small instruments, through their skills can elevate themselves to the status of the fabricator. This is, in a way, a misconception of reality by the author. It is not bourgeois propaganda but the objective reality (as brought out by the author himself) that out of 25 fabricators studied 23 of them were workers before becoming fabricators. It is a case of vertical mobility. The author suggests that to make the trade union movement strong certain demands like registration of fabricating units and implementation of labour laws should be raised. The experience of the 1972 strike indicates that collective resistance in the traditional way led to capital reorganisation and for nearly two decades there has been no struggle in the hosiery units. In the era of capital reorganisation the trade union movement has to think and act in creative ways.

Conceptually the author's insistence on characterising units producing 55 per cent of their exports themselves as exporting units is not tenable and as also their characterisation of merchant manufacture units since they deliberately decentralised their production by allocating some processes to the fabricators. The author has examined the hosiery industry within the framework of the small industry sector which has been termed unorganised industry. Without using a precise definition of small sector the author clubs large and registered units (producer cum exporters) with the small and unregistered units. How can large unit employing on an average 376 workers and with annual turnovers of crores of rupees be studied in the small unorganised framework? While analysing the size of capital the author is concerned with only value of plant and machinery and ignores building and other fixed productive assets both in case of producer cum exporting units and fabricating units.

At the empirical level two problems need to be mentioned. First the phenomenon of ruthless exploitation is well known in in-

dustries which have skirted protective labour legislation. This exploitation is shared between the subordinate and controlling units. The author could have attempted a quantification of sharing of surpluses in the form of profits of these enterprises. This has not been done. Secondly, emergence of industrial units from below is not a phenomenon strictly related only to traditional industries. The small-scale sector has proliferated in a large number of modern industries. This has been further strengthened by the policy of ancillarisation followed in the recent years. There is a major difference between the small industry sector among traditional and modern industries in terms of capital intensity. Dhar and Lydall pointed out this in their study in the late 1950s.⁵ This has consequences both for the labour process and the relationship between the small and large units. Some of the large units in the engineering industry of Ludhiana have grown in course of time from small workshops. The author has not included any study related to small/unorganised modern industry in the review of literature to point out such differences. This is to point the diverse ways in which various industries can develop relationships between the small and large units and consequently have implications for labour process. Careful editing of the work would have reduced repetitions and the factual mistake of naming Jalandhar and Ludhiana as border districts. However, the book is a welcome addition to the subject and provides valuable insights into the development of the small industrial sector under conditions of population pressure. It is hoped that this will provoke more studies in the industrial economy of Punjab.

Women & Science — Selected Essays

Maithreyi Krishnaraj

This volume deals with three related spheres—women, work and science. It is concerned not only with what it means to be employed in science establishments but more importantly with what science means to women scientists, the significance they have derived from the experience of science education and that of being placed in an environment of scientific work.

Transformation in Bulsar

Suthars and Relevance of Caste

Hein Streefkerk

If capitalist transformation is accepted to be the dominant tendency during the last two decades in many parts of India, including Gujarat, how has it influenced the development of Bulsar, a town in south Gujarat and what are its sociological manifestations? How have the Suthars, who played an important role in the industrial development of Bulsar having started the first industrial workshops and factories, fared in these decades?

The author, who had studied the industrial transition in the region 16 years ago, revisited the area to investigate the changed class, power and status configurations there

AFTER a gap of 16 years I went back to Bulsar in south Gujarat where I had done my first research in 1970 and 1974. Finally, in 1990, I was able to stay in the town in February and March. My visit was to be more than only a 'sentimental journey'. I wished to check my expectation that Bulsar and its environment had changed more than the Indian and Dutch researchers expected in the seventies (Bremas and Hommes 1979: 15).¹ My expectation was based on bits of information brought home by colleagues who occasionally had visited the former research area on my own experiences in Gujarat and India, and on general empirical and theoretical knowledge about developments in different parts of South Asia. I became convinced that capitalist transformation has been the dominant tendency during the last two decades in many parts of India and certainly in Gujarat. One of the purposes of my re-visit in 1990 was to understand how Bulsar has been influenced by this development and to trace its sociological manifestations.

Furthermore, I was curious to know how the Suthars of the town had fared during the last two decades. They were part of my research in 1970 and 1974 because they played a major role in the industrial development of Bulsar and elsewhere in south Gujarat. They were among the first to start industrial workshops and small factories (Streefkerk 1985: 68-128). By studying them in 1990 I could update their history and thus cover a period of almost hundred years, or four to five generations. My interest in them also enabled me to be more specific about general sociological trends.

The constraint of time hindered a thorough and systematic investigation. I nevertheless could collect enough information to present a picture of major changes in Bulsar and its surrounding area during the last two decades. In the first part of the account I describe the overall tendencies by focusing on the changed configuration of class, status and power. The second part will be dedicated to the Suthars. In the epilogue the local findings will be related to general theoretical discussions and the actual Indian situation.

BULSAR IN 1990: A BOOMING TOWN

When I returned to Bulsar in 1990 I found a town difficult to recognise. Its skyline had changed drastically, with many new flats, eight multi-storied buildings each with 10-12 storeys and numerous TV antennas. The main streets in the centre are overcrowded with cars, scooters, motors and scooter rickshaws, annoying pedestrians. In the centre new markets and shopping centres have filled up former open spaces or replaced old buildings. The Kantibhai Desai cricket stadium and sports complex, named after a prominent Anavil who took the initiative to build them, occupy the area which was a large open marshy pond in the heart of the town. The outskirts of the town look different too. Along the roads leading out of the town residential quarters have come up. For instance, the first part of the erstwhile quiet road to the sea-side village of Tithal has become the site of opulent bungalows, luxurious stores, small restaurants, government quarters and air-conditioned offices of businessmen. In another periphery of the town, in the reclaimed Dholi talav, is the largest slum area of Bulsar called Shapurji Nagar. The place is called after Shapurji, a Parsi municipal councillor who in 1985 caused the allotment of the area to house the poor and destitute of the town. To the inhabitants of the neighbouring housing societies, the slum-dwellers are a permanent 'threat'. They believe that the slum-dwellers are criminals who are not allowed to live within the limits of the municipal area. Actually, the area is populated by labourers, servants, peons and sweepers, rickshaw drivers, by migrants from UP or Kerala and by families who were forced to vacate their hutments in order to allow the contractors to build new houses. The area also has lepers in the fringe and they have been there for more than 20 years.

The immediate rural environment of the town has also changed. More land has been brought under cultivation while some former agricultural plots have been converted into 'non-agricultural' land. This has happened, for instance, along the national highway between Bombay and Baroda, and the two State highways connecting Bulsar

with towns and villages east of Bulsar. Traffic on these roads has increased enormously. The two lanes of the national highway are too narrow for the columns of vans which drive along them day and night. Along these roads small-scale and medium-sized industries have come up. A co-operative sugar factory is one of them. It signifies the importance of the introduction of canal irrigation and the related increase in the cultivation of sugarcane in Bulsar taluka.

The Gundlav industrial estate run by the GIDC (Gujarat Industrial Development Corporation) has expanded. After 1985 a second GIDC estate was established opposite the first one, on the other side of the road. The two estates, 3 km to the east of Bulsar, also accommodate branch offices of major banks, a telephone exchange, GIDC offices and flats to house the office personnel of industrial enterprises. On both sides of the road there are tea stalls, repair-workshops, shops of traders selling foodstuff or spareparts, and houses of people who collect and sell all kinds of industrial waste. A service station for tractors and a recently opened garage are the most sophisticated establishments along the road.

One still finds the make-shift dwellings of migrant tribal labourers along these roads. They used to come to cut grass,² to work during the harvest, or in other kinds of unskilled jobs like the maintenance of roads. Now they are hired to cut sugarcane as well. To the south of the town, along the river Vanki, there is 'Vashier Valley'. It is a residential area on the banks of the river where 85 bungalows are to be built. The project has been undertaken by the two biggest estate developers of Bulsar. The sales prospectus pompously announces that it will be fully equipped with infrastructural facilities like water supply, street lights, roads, etc. and that there will be a beautiful children's park and a riverside hide-out for all age groups. The prospectus finally points to the 'famous Tithal beach, the site for lovers of sun and surf'. It refers to Western sun-bathing and surfing, though generally Indians do not either sunbathe or surf-ride.

My impressions are also supported by statistics. For instance, the number of

telephone connections increased from 650 in 1970 and 1,350 in 1980, to almost 2,130 in 1990. This is a growth rate of 138 per cent between 1970-80, and of 37 per cent between 1980 and 1990. The size and growth of the population is one of the most revealing figures. In 1971 the urban agglomeration of Bulsar, including four adjoining villages, had a population of almost 55,000 (Streeter 1985: 18). In 1981 there were almost 73,000 inhabitants (*Statistical Outline of Gujarat*: 76), which means a decennial growth rate of 32.6 per cent. The growth rate of the Gujarat population was 27.7 per cent in the same period (*Statistical Outline of Gujarat*: 5). In 1990 officials in Bulsar estimated the size of the town and a few neighbouring villages at about 1,20,000 people. Even a cautious guess of a 10,00,000 inhabitants means a growth rate of 37 per cent between 1981 and 1990. This is much more than the estimated all-India rate of 20.5 per cent (*Statistical Outline of India 1989-90*: 37).

The growth of the population after 1980 is caused by natural increase and migration: Bulsar became more and more attractive to outsiders. They are mainly from Bombay and to a lesser extent also from Surat, the fast-growing industrial and commercial city, 70 km to the north of Bulsar. Labour is cheap and the prices of land and houses are still low compared to those in cities like Bombay, Surat or Baroda. Furthermore, life in Bulsar is more comfortable and convenient. It is a small, pleasant town near the seaside, and can be reached easily by train. Houses and flats are bought as permanent residence or as a second-house. The latter is the case in the seashore village of Tithal, where many new flats are owned by Jains from Bombay. Most of the time the buildings are empty, except during some weekends and summer holidays. Bulsar's administrative importance also has brought people to the town. It is a district headquarters with a growing number of offices and civil servants.

The unusual growth of the population is one of the explanations for the boom in building construction in the eighties. The boom really started after 1985: The first of the present eight multi-storeyed buildings was completed in 1986. The enormous increase in new buildings meant the growth in the number of building contractors and real-estate developers at the same time. In 1970 there were only four or five major contractors, while in 1990 there are almost 40. Another reason for the building boom is that investment in real-estate became a lucrative means to employ black money. During the last few years there has been sharp rise in the prices of land and houses. In some cases the price of land, for instance in Tithal, increased 10 times in a few years.

Many newcomers from Bombay are owners or managers of enterprises which were brought to south Gujarat in recent years.³ They are located mostly in the huge GIDC industrial estate at Vapi, 25 km to the south of Bulsar towards the Maharashtra-Gujarat border.⁴ At present there are

almost 2,000 establishments, which is 10 times the number in 1970, when the estate was still under construction. The estate is meant for chemical industries in the first place. Due to serious pollution of water and atmosphere, and inadequate facilities in the small town of Vapi, owners and managers prefer to stay in Bulsar.

The GIDC estate of Gundlav, meant for small-scale enterprises, is another area where outsiders can establish their factories. Because Vapi accommodates them and they want to keep the area clean, chemical units are no longer allowed in Gundlav. The second estate, opposite the original one, began in 1985 and now the two estates accommodate 183 establishments; in 1974 there were only 20.

The old inhabitants have contributed quite a good deal to the growth of the town. The more affluent among them have built new houses as well. In the old quarters of the town, like Baniawad, Parsiwad or Sutharwad the inhabitants own their houses and land. Many of them demolished their old single or two-storeyed houses and built blocks of flats with four to five storeys. They now live in these new flats, and rent out flats they do not occupy. In the old part of the town an apartment of three rooms fetches a rent of Rs 1,000 per month. A similar apartment, located in a more peripheral part of the town, brings in a monthly rent of Rs 1,200-1,500.⁵

There is a spurt in all kinds of commercial and professional services and activities. Compared to 1974, there are, for instance, many more medical doctors and private hospitals now, offering specialised services. Another visible change in the town's life is the proliferation of scooter-rickshaws. Though they certainly quicken public transport within and outside the town, they are far from convenient because the roads are bumpy and the springs are bad. Their exhaust fumes and noise, and the unpredictable behaviour of the drivers are a permanent annoyance, even to local people, let alone a foreigner. To have the vehicle equipped with a cassette-player and two loudspeakers on both sides of the passenger seat, like an ear-phone, is the latest novelty. As soon as the driver turns on the ignition key, film music almost blows the passenger out of his seat.

Rickshaws replaced the Muslim owned horse-carts, which were the main means of public transport till 1976. Since 1975 the purchase of a rickshaw is facilitated by special bank loans. Many rickshaws are given on rent by the owners to drivers. Among the owners Muslims and Tandelis (fishermen) predominate. The Tandelis live outside Bulsar in coastal villages like Kosamba. Some of the other proprietors are government servants and employees of private firms, like Atul. Officially their wives or relatives own the three-wheelers.

The daily net-income of an owner-driver is not more than Rs 50. When the rickshaw is rented the driver gets $\frac{1}{4}$ of the income earned during 8 hours a day. Out of this amount he has to pay for the petrol. His net

daily income will amount to a maximum of Rs 25. The drivers are Muslims, Tandelis, Kolis and Dhodyias. Several of them are graduates and few have even a masters degree. Driving a three-wheeler is often a part-time activity, combined with another job.

Because the official records are far from reliable it was difficult to trace the exact number of three-wheelers in Bulsar. The files of the self-appointed chairman of the Bulsar Town Autorickshaw Association are perhaps the best source. Around 1970 he was one of the first to own and drive a scooter-rickshaw in Bulsar. At present he runs a shop, selling scooter-rickshaw spares, at the main rickshaw-stand near the bus station. His books show the impressive number of 2,860 rickshaws in Bulsar and adjoining villages in 1990. It is hard to believe that so many three-wheelers circulate on the roads of the town and nearby villages. Several rickshaw owners and drivers, however, mentioned the same number when asked for the number of rickshaws in the area. Even though the figures may not be correct, they do indicate a trend. When the self-evident sharp proportional increase of rickshaws in the early seventies is left out of consideration, then the largest increase in number of rickshaws is between 1985 and 1990. In those five years the number of vehicles increased from 1,186 to 2,862, or by 141 per cent, while between 1980 and 1985 the percentage was 116. Their sharp increase after 1985 parallels the expansion of the town in those years. The growing number of rickshaws during the last 10 years means that more and more people in Bulsar are willing and able to pay at least Rs 2 to 3, the minimum fare, to be driven from one place to another. It also indicates the emergence of a new transport culture by which is meant that even short distances are preferred to be covered by mechanical means of transport for prestigious reasons.

CLASS, POWER AND STATUS

Material changes often indicate changes in the configuration of class, power, and status. Collecting of empirical evidence to trace the changes was beyond the scope of my research. Still, some observations are possible, but they are of a hypothetical nature.

The first pertains to changes in the local class structure. The social composition at the top of the economic stratification changed since the early seventies. In 1971 Parsis belonged to the economic elite of the town but in 1990 they lost their economic prominence,⁶ though several families are still very rich. Furthermore, the number of prosperous 'outsiders' increased. Bantias and Anavils continue to dominate the economic life of the town, they are the wealthiest businessmen, and the richest building contractors and estate-developers. During a raid by officials of the income tax department in 1989, when black money worth many crores of rupees was unearthed, the officials caught only Anavils and Bantias. In the 1970s the economic power of Anavils was largely

based on timber trade and mango gardens. This changed during the eighties. Timber trade declined due to the policy of the government to save the forests. The traders closed their firms and became financiers or building contractors.

Owners of mango gardens earned large amounts by selling their orchards. Anavils with gardens in the area of the national highway and State highways could sell their property because land was to be converted into non agricultural land, meant for industrial development. Other Anavils sold their orchards to Kolis and even a few Dhodiyas. These people could buy the gardens because they earned considerable amounts by the sale of their own plots of land, the value of which increased due to their strategic location.

By selling their gardens the Anavils were able to further intensify their urban orientation. In the villages Kolis consolidated their economic position or took over the economic prominence of the Anavils. Their economic ascent is a consequence of the introduction of canal irrigation and the cultivation of sugarcane in the first place.

The people at the lower rungs of the economic stratification, those who only have their poorly paid labour power to survive, are still the same. They are former tribals like Naikas, Kuknas, Dhodiyas, Dublas and migrant labourers from more interior areas of south Gujarat or Maharashtra, and other poor Hindus and Muslims. They earn a little by performing all kinds of irregular jobs, either as self-employed or as casual labourers. They are the temporary and semi-permanent workers in small workshops, small and medium scale factories, domestic servants, or assistants and servants in shops, restaurants and hotels. Their labour has no legal protection and they are still personally dependent upon the whims of their customers and employers. They are the inhabitants of Shapurji Nagar, others reside in dwellings in the old part of the town. Some of their dwellings are hidden behind posh bungalows or newly erected flats, where they are not sure they can stay much longer. The casual labourers in building construction have temporary shelter in the buildings they work on.

I am unable to present detailed figures on the economic position of this large category, whether their position improved or not, and to what extent. In any case, the official minimum daily wage went up from Rs 3 to 4 in 1974 to Rs 21 in 1990. However, people are often paid less than Rs 21 per day. Even more important is the enormous rise in prices of basic necessities of life, like cooking oil, sugar, vegetables, textile, energy, medical services, accommodation, public transport and so on. Those employed in building construction probably did profit most from the enormous expansion of construction activities. Their labour is in great demand and they are among those whose daily wages are said to exceed Rs 21 per day.

The wide social and material differences between the people of Bulsar and the population of the district in 1970 was the

reason why the setting of the research area was described in terms of 'polarity' (Schenk-Sandbergen and Schenk, 1979: 18). This characterisation is still appropriate when the focus is on the extremes of the social and economic stratification of the town. However, the description would conceal several important tendencies which occurred during the last decade.

Some groups at the lower end of the stratification have been able to improve their material condition. The much debated official policy to 'reserve' places and appointments in education, government organisations and politics for scheduled castes and tribes, has even institutionalised channels of upward mobility to a certain extent. Employment in banks and government offices of fers salaries and secondary labour conditions like loans and security schemes, which compare favourably with the insecure and poorly paid work in the private sphere. Thus, for instance, the material situation of those untouchables permanently employed by the sanitation department of the town probably improved during the last 15 years. Dhodiyas and other former tribals also could profit from the social arrangements meant for them. Furthermore, the material expansion of the town and the surrounding area provided opportunities for the younger generation, like skilled or semi-skilled jobs in building construction, and better paid jobs in shops and stores in the new shopping centres, or in industrial concerns outside the town or in Vapi. Regular and more income of some of the children enables parents and other family members to better their circumstances. Their physical and social resistance increased; they could improve their houses, buy a fan, bed or gas stove.

The emergence of a middle class⁶ is the other most striking development during the last 10 years. It is a major feature of the class structure of Bulsar in 1990. This middle class is graded and made up of managers, professionals, small scale industrialists, small businessmen, shop owners, government personnel, employees of private firms, etcetera. They populate the multi storied buildings, new flats and residential quarters, and patronise the fashionable stores in the new shopping centres. They purchase goods made available through the liberalisation of the economy in the eighties, like motor cycles, scooters, cars, refrigerators, TVs and other consumer electronics (ODI 1989: 12).

Changes in the distribution of power accompany the rise of the middle class in Bulsar. For instance, the composition of the municipal council in 1990 shows a much larger proportion of 'middle groups' than in 1971. In 1971 Desais, Baniyas and Parsis occupied the majority of seats in the council. The largest single group of seats belonged to Parsis and the mayor of town was a Parsi (Thakore 1979: 300). In 1990 Anavils, Baniyas and Parsis lost their numerical prominence, though a Parsi is still the chairman of the council.⁷

Anavils and Parsis no longer dominate the municipal council but they do represent Bulsar constituency in the legislative

assembly of Gujarat State. In 1983 a Parsi from Bulsar was elected MLA on a ticket of the Congress(I). He was a former chairman of the municipal council of the town. In the state assembly elections in 1990, he was succeeded by an Anavil from Bulsar. The Anavil, who represents the Bharatiya Janata Party (BJP), defeated the Koli candidate of the Janata Dal and the Dhodiya candidate of the Congress(I). Perhaps he won the elections because of the strong opposition against the Congress(I) of Rajiv Gandhi, which suffered heavy losses in Gujarat and elsewhere in India during the State assembly elections in 1990. Yet, it remains significant that an Anavil became the BJP nominee for Bulsar constituency, and that he was able to mobilise more votes than the Koli candidate of the Janata Dal. Kolis are numerically dominant in the area and the Janata Dal was one of the ruling parties in Delhi.

When describing features of the class and power structure of Bulsar I referred to people known to be Anavil, Bania or Koli. I used social categories or rather castes which are based on other attributes than wealth and power. The latter are important determinants of individual and collective status. But prestige and respect are still largely decided by the ritual position of the group in which people are born.⁸ Caste or community and family status in particular remain major sources of identification and frame of reference of the individual.⁹ These factors largely determine life styles, perception of others, and interaction among individuals and between groups.

A growing divergence between caste, class and power components of stratification has been an important tendency since independence. It has been a result of economic developments, occupational diversification and administrative measures. The latter include franchise, land ceiling acts and tenancy laws. The Moulis (1989: 35) show the levelling of the landownership in Gujarat during the last 20 years. It shows the dwindling of upper-caste dominance and the socio-economic progress of middle and lower castes and tribal groups. They explain this tendency by the green revolution technologies and the consequent socio-political pressures to enforce land reforms and ceiling acts. In south Gujarat too levelling tendencies and the growing discrepancy between caste, class and power, can be observed. In the villages the political and economic importance of Kolis and Dhodiyas, who respectively are in the middle and at the lower end of the ritual order, has increased during the last few decades.

In Bulsar, class, status and power still tend to coincide at both ends of the ritual hierarchy. At the top there are upper castes like Baniyas and Anavils whose members are rich and influential in the political and administrative field. The lowest echelon of the hierarchy is made up of tribal groups like Dublas, Kuknas and Naikas. In the villages they are landless labourers and owners of tiny plots of land, who are marginalised in every respect. They survive by circular migra-

tion, or by finding employment in cities and towns like Bulsar. Some of these migrants eventually develop roots in this new setting.

The prominence of Banias and Anavils is rooted in the past. Members of the two castes were merchants, moneylenders, land-owners and better-placed government employees. They had a tradition of learning and monopolised higher education till the turn of the 19th century (Ghanshyam Shah 1987). According to A M Shah (1989: 22) they were 'urban and rural-cum-urban castes'.¹¹ Their members were the first to take advantage of new and lucrative opportunities in trade, industry, administration, professions and education, during British rule and after 1947. And higher castes formed a larger proportion of the population in urban than in rural areas. Those castes with the least urban component were the last in taking advantage of such opportunities.

Tribals, who constitute the majority of the rural population in south Gujarat,¹² lacked an urban component in the past. The number of Dublas, Naikas and Kuknas in towns and cities increased during the last decades. But due to their social marginality and poverty, urban tribals are unable to offer lucrative opportunities to their rural brethren. There are a great number of middle and lower castes in the town whom Shah (1989) calls 'urban castes'. They are artisan and craftsmen castes such as Sorn (goldsmith), Kansara (brazier), Bhavsar (weaver, dyer, printer), Khatri (cotton weavers), Ghanchi (oil presser), Rana (rice pounders), Darji (tailor) and Mochi (cobbler) (Streefkerk 1985: 22,23; A M Shah 1989: 9). As I did not study these caste groups I am not able to present a detailed account of the caste hierarchy in Bulsar and the changes that occurred. Neither can I be specific about divergence or overlap between the caste, class and power dimensions in the middle and lower ranges of the urban stratification. However, there are examples of castes whose members could improve their economic position. They were able, through their original occupation, to participate in the expanding and modernising economy. Ranas became owners of rice and pulse mills and well-to-do rice and grain merchants. Some Mochis own shoe-shops with large assortments of ready-made shoes, including jogging shoes. Others, like Tandels, invested money earned by their original activities in another direction. They are fishermen and carry in their boats goods smuggled from the Arabian coast into India. They bought rickshaws and, together with Muslims, Tandels became the major owners and drivers of rickshaws in and around Bulsar.

Suthars (carpenters) are another example of a group whose members have been able to participate in, and contribute to the expanding economy of south Gujarat and Bulsar. An account of their past and present will be the subject of the second part of this article.

SUTHARS GENESIS OF URBAN CASTE

In south Gujarat and Bulsar, Suthars (originally carpenters) and Luhars (originally

blacksmiths) form one single endogamous category or a caste division of the first division (A M Shah 1982: 5).¹³ There are more Suthar, than Luhar households in Bulsar. In 1971 there were at least 250 Suthar households and probably 25 Luhar households (Streefkerk 1985: 98). Names of several areas in the old part of the town, like 'Suthar Chawl' and 'Luhar Tekra', suggest a second-order division between Suthars and Luhars. However, this distinction is anything but clear. Some Suthars consider themselves to be superior to Luhars. They believe that working on iron is more crude and polluting than carpentry, that Luhars eat non-vegetarian food, and that they have the habit of drinking liquor.¹⁴ Furthermore, they maintain that Luhar women can marry Suthar men, but that the reverse is not appreciated.¹⁵ For others, the youngest generation in particular, these ideas belong to the past. At present there are 425 Suthar households. The number was given by the leaders of the 'Shree Panchal Seva Samaj'. They did not distinguish between Suthars and Luhars. The interchangeability of both occupations in villages and towns, a trait already noted by Gadgil in 1924 (1973: 173), probably contributed to the disappearance of the sharp distinction between Suthars and Luhars. Moreover, the work of carpenters and blacksmiths frequently complemented one another, as, for example, in the manufacture of agricultural tools and means of transport. At least a few Suthars are aware that their grandfathers had switched over from working on iron to wood or combined both, as for example, when making bullock-carts. The present occupational diversity among Suthars and Luhars further eroded the distinction among them. In the remaining part of the article I will follow the dominant habit in Bulsar and treat Suthars and Luhars together and call them Suthars.

At present Suthars are an 'urban caste'. Several of them reside in villages adjoining Bulsar municipality, but these villages belong to the urban agglomeration of Bulsar. Suthars claim to have no ties with their natal villages, and have long since stopped visiting them. They no longer have family property there, and there is no trace of their original houses.

Around 1900 there was a massive migration of Suthars and others from their villages in south Gujarat. It is said that this exodus was caused by an influenza epidemic and a famine during these years; a fact confirmed by Mukthiar (1930: 51) for the village of Atgam. The inadequacy of their wages, which were still paid partly in kind,¹⁶ and their declining economic position in the villages were other major reasons for the migration of Suthars and other artisans, which began even before the turn of the century (Streefkerk 1985: 75). These were inter-village or inter-regional movements depending on demographic circumstances and economic possibilities. After 1900, they, Suthars in particular, also went abroad, to East Africa and Fiji (Streefkerk 1985: 114). The third type of migration was from

villages to smaller towns like Bulsar or Navsari, and from towns to the cities of Ahmedabad and Baroda, and Bombay in particular. Their stay in these cities often was seasonal or temporary. After some time they returned to their regions. But return did not mean the severance of ties with these cities. At present almost all Suthar families in Bulsar have near or distant relatives who live and work in Bombay, and to a lesser extent in Ahmedabad or Baroda.

The Suthars who migrated to Bulsar and Bombay took up four major occupations: (i) building-construction work, (ii) furniture-making and general carpentry, (iii) metal-work in small repair workshops, and (iv) carpenters and smiths, fitters and turners employed by the railways.¹⁷ Building-construction and furniture-making were the most lucrative. Between 1930 and 1970 Suthars were the major building-contractors in the town. They built houses of the prosperous inhabitants like Banias, Parsis and Desais, in the old part of the town. They were also involved in the construction of the Railway Colony, where mostly the European employees of the British-controlled Railway Company were accommodated. After independence, in 1955, one of them built the town hall of Bulsar. Later on, in the late sixties, they undertook the construction of modern bungalows of the newly-developed co-operative housing societies. This is the first major extension of Bulsar after 1947.

Since 1930 several big furniture workshops exist in Bulsar, owned by Suthars. In at least one case, building contract and the making of furniture were combined within one family. Several Suthars and Luhars started small engineering workshops in the thirties and forties but their opportunities were restricted. Neither the town's economy nor the agriculture in the surrounding villages offered much scope for this kind of metal-work (Streefkerk 1985: 78, 79). Before independence, the Railway Company was one of the major employers in Bulsar. Anavils took hold of the 'white-collar' jobs, Suthars and Luhars worked as carpenters or performed engineering jobs in the maintenance of the wooden coaches and engines. Some became engine-drivers as well. Employment in the Railway Company meant being transferred from Bulsar to other stations along the railway line. The railways thus were a cause of migration among the Suthars. Though serving in the railways was certainly less lucrative than being a successful contractor or furniture-maker, it offered economic security and favourable secondary benefits.

Compared with their condition in the villages, the economic situation of Suthars in Bulsar improved between 1910 and the second world war. An elite emerged composed of contractors and furniture-makers. The houses they built outside the town in the thirties are still witnesses to their prosperity. Many other Suthars later settled in these areas. Some others resided in the old part of the town, where they still own houses and land. Suthar families who were really pros-

perous, however, were a small minority. Many became carpenters or workers in the firms and workshops owned by their caste fellows. Others had to be content with simple jobs, with earning modest incomes, in the railways. Many could not afford to buy land and build their own houses in the town.

In the forties some Suthars started bobbin factories. They were among the first in Bulsar to engage in an entrepreneurial form of industrial production. Between 1941 and 1965 there were about eight bobbin firms owned by them. During the second world war, the demand for wooden bobbins, used in the textile industry, in Bombay, Surat and Ahmedabad, increased. Imports from England and Japan were cut off. At the same time the production of textiles grew considerably due to the demand from the Indian Army. The local demand also increased, because imported textiles were no longer available. Between 1950 and 1960 production of wooden bobbins in Bulsar expanded further. Following the second world war, the Indian textile industry expanded with an increase in the range of textile manufactured, partly due to the introduction of synthetic fibres. The availability of wood facilitated the production of wooden bobbins in Bulsar. Traditionally the town had been a centre for timber trade, the nearby forests guaranteed a regular supply of wood. Furthermore, the relatively low capital intensive structure of bobbin production added to the transition. Capital was supplied by Banias and by Suthars themselves. They knew how to work on wood, labour was provided by family members and poor caste-fellows.¹⁸ Thus the production of bobbins became a main feature of town's economy in the fifties and sixties. Its significance is marked by the mayoralty of a Suthar. He was president of Bulsar's municipal council in the early fifties. It was during this period that a Suthar contractor was engaged to build the town hall.

The establishment in the fifties of the huge chemical complex of Atul, 7 km to the south of Bulsar, and the fact that the town became district headquarters in 1964, created new opportunities for Suthars. It meant a greater occupational range for them. More Suthars became part of the incipient middle class in Bulsar. At that time, the youngest generation was better educated compared to their fathers and uncles. Through the presence of family members in Bombay and other cities, they were able to follow higher education and special courses outside Bulsar. Some of them became graduates in chemical and civil engineering or completed other engineering courses. Several of them got responsible jobs in Atul, or were absorbed as engineers in the higher ranks of the expanding State administration in Bulsar and elsewhere in Gujarat. But still, for many the railways were an important employer.

Several Suthars profited from the new opportunities as private entrepreneurs. Suthar contractors were engaged in the construction and maintenance of the Atul complex, which included residential quarters. One of them succeeded in getting the contract to fabricate

the wooden furniture and equipment used in the Atul complex. Another opened the town's first general store, selling modern provisions to the higher personnel of Atul. The latter generally had a more cosmopolitan background than the inhabitants of Bulsar. Migration remained a salient feature. Suthars went to Bombay and other cities, where they were employed by private industrial concerns, started their own workshops, or became contractors. One of them went from Bulsar to Calcutta, where he became a successful architect.

DISAPPEARANCE OF SUTHAR INDUSTRIES BETWEEN 1970 AND 1990

In 1971 and 1974 I studied Suthars from the perspective of Bulsar's industrial development. They were an example of local craftsmen, small producers, who accomplished the transition to industrial production through the manufacture of bobbins. I compared this process which stagnated from the late sixties onwards with the developments among Suthars and other artisans in the neighbouring town of Bilimora. There the transition was far more spectacular with some of them owning modern industrial enterprises producing deep well pumps, other agricultural implements, textile machinery and other engineering products. I explained the divergent industrial development of Suthars in Bulsar and their caste fellows and members of other artisan castes in Bilimora by pointing to the political historical differences between the two towns. The second variable is the close linkage between the industrial development in Bilimora and the more fertile and prosperous agricultural surroundings of the town (Streefkerk 1985: 105-25). Recent developments among Suthars in Bulsar, which are dealt with later on, confirm the importance of this variable. First, I will discuss the fate of the bobbin industries during the last two decades.

Between 1940 and 1971 the number of producers of wooden bobbins in Bulsar increased to such an extent that for a portion of them the competition became too great. The majority of the 12 bobbin firms in 1970 were 'subsistence firms' they did not grow and prosper but subsisted (Streefkerk 1985: 87-90).

Now there are five bobbin workshops in Bulsar, two of which are owned by Suthars, two by other artisans, one is owned by a Brahmin. In 1971 they were small firms and in 1990 they are still the same. They employ about 7 to 8 workers on a daily basis. Thus the workers are kept outside the purview of labour legislation. Yet, some have been working in the same units for years as 'temporary hands'. I was recognised several times by workers with whom I talked 15 years earlier in the same workshops. Two other bobbin workshops are owned by Dhodiyas. They are former employees of a bobbin factory which was closed several years ago by its Bania owner. They took over the inventory and started doing job-work for other bobbin manufacturers in Bulsar. The

two Suthar firms are the only workshops left from the six Suthar factories in 1971. In one of the two workshops, bobbins are only one of the products manufactured. The main items are wooden handles of screwdrivers and chisels. By well-to-do Suthars, the owners and their families are described as 'not rich, not poor'. They do not have a car, nor a telephone connection. But they own their houses and have landed property in Bulsar, on which one of them had built a three-storeyed flat.

The two biggest bobbin factories in 1971, both owned by Suthars were closed in the early eighties.

Mistry Wood Works stopped its production after its 85 year old founder expired in 1982. Of the two sons, one lives in Bombay and the other in Bulsar. The son in Bombay is on bad terms with his family in Bulsar. The son in Bulsar, about 48 years old, did not want to continue the production. He closed the factory and now is living off his share of the ancestral property in Bulsar, which includes several houses given on rent. He has four daughters and a son. Two daughters are married to Suthars. One of them lives in Ahmedabad and the other migrated to the US. The third daughter will migrate to Portugal, where she will marry a Mochi from Bulsar. His family migrated to Mozambique when the country belonged to Portugal. The fourth daughter and the only son who is the youngest, are still attending the secondary school.

Vishwakarma Engineering, the oldest bobbin factory in Bulsar was closed also in the early eighties. Between 1950 and 1970 it was one of the most prosperous firms but in the seventies the manufacture of bobbins was not really profitable any longer and the owner grew old. He closed the factory which was situated in one of the main streets of the town. By selling the land he added many lakhs of rupees to his wealth. He has four sons, two of them are living in the US, one is an engineer in a textile company in Bombay and the fourth son owns a lodge in Bulsar.

The precarious position of bobbin industries in the early seventies was still further weakened by the rising prices of wood and the decreasing demand for the traditional wooden bobbins. The first was the result of the official policy to protect the forests. The second was caused by the use of synthetic bobbins by the textile industry.

Except for the few owners of small bobbin workshops and other wood-working firms, the Suthar industrial pioneers vanished from the industrial scene in Bulsar between 1980 and 1990. Their disappearance is perhaps best exemplified by the end of the engineering company 'Quality Instruments Pvt Ltd'. In the late sixties it was one of the larger engineering enterprises in Bulsar, manufacturing transformers. The company was owned by four Suthars, who were related to a prominent owner of a bobbin enterprise (Streefkerk 1985: 95, 96). From its start in 1961, the factory ran far below its capacity. The Suthars faced difficulties in procuring raw material, for which an import licence

was required, and they were unable to book sufficient orders. In 1973 the majority of the factory's shares was taken over by a family member from the neighbouring town of Bilimora. He was one of the successful Suthars in Bilimora, owning several large metal-working enterprises. The Bulsar unit was to do job-work for the Bilimora enterprises. A few years later the company was liquidated. Two of the four original partners expired, the third is an employee of one of the Suthar companies in Bilimora, and the fourth is a sales manager in a paper-manufacturing company in Bilimora. The son of one of the expired partners runs a small scooter and motorbike repair-shop in Bulsar while his brother works in an engineering company in Bombay. Their two cousins are both employees in different industrial companies in Bombay. One of them commutes daily between Bombay and Bulsar. He is the proprietor of a very small workshop, called 'Electrical Sound Industries'. A skilled worker operates the only lathe. He repairs and makes sound equipment, and transformers.

The sons of the owners of the remaining wood working enterprises do not seem to be the ones who will rejuvenate Suthar industrial entrepreneurship in Bulsar. They are salaried employees, serving as chemists, draughtsmen or engineers in industrial enterprises at Vapi, or they are partners in the firms of their fathers, helping them to keep the firms going and earn a reasonable income. But the firms will remain subsistence enterprises, which do not prosper or grow.

Segvi is one of the villages belonging to the urban agglomeration of Bulsar. It is situated along the road leading to the Tithal beach, at a distance of a few kms west of Bulsar. It accommodates several families of artisans who own workshops. Among them are a few Kumbhars (or g. potter) of whom one family runs a sawmill. Most workshops are the property of Suthars. One family owns two engineering units. According to the owners they are able to fabricate many products like chemical equipment, steel furniture, metal sheets, pipes and frames, and dies for brick manufacturers. Despite this impressive range of products, the performance of the family enterprise is rather poor at the moment.

The firms of other Suthars are certainly more prosperous. Since 30 years, one of them manufactures wooden furniture and wooden equipment used by Atul and its sister concerns. The owners of two other prosperous units both sell tractors, but of two different brands, and they both manufacture trailers and agricultural equipment. These two large families, 'Jeepwalas' and 'Panchals', as I will call them, are neighbours. The Jeepwalas live in three separate households and three houses while the Panchals live in one house and share one kitchen.

The Jeepwalas and Panchals descend from one great grandfather who was a carpenter in Segvi. Their two grandfathers were also carpenters. They made the wooden frames of the houses in Segvi and nearby villages.

In 1990 the Jeepwala family comprises two generations. The eldest generation consists of four brothers, sons of the fore-mentioned grandfather. They remained in Segvi, earning a living by making and repairing horse carts and bullock carts. Their present age is between 74 and 83. Three brothers migrated to Bombay. One of them is an engineer in the Bombay Municipal Corporation, the other is a designer and the third is an architect. The youngest generation consists of the sons—and small children—of the four Segvi-brothers and a son of one of the Bombay-brothers, their age varies between 25 and 40 years.

The Panchals are made up of three generations. The eldest in the family is the grandfather, a cousin of the expired grandfather of the Jeepwalas. He made bullock carts and horse carts, for which he was known all over south Gujarat. His present age is 81. His four brothers migrated to other towns and villages in south Gujarat. The second generation consists of the eight sons of the eldest member of the family. Three of them live in Segvi, they are between 35 and 55 years of age. Four sons migrated to Bombay where they are all employed in technical occupations. The eighth brother owns a small engineering workshop in Bilimora. The children of the brothers living in Segvi constitute the third generation. Their age varies between 14 and 35 years.

The early seventies were crucial years for the two families. Till then they manufactured and repaired traditional agricultural implements and means of conveyance, like bullock carts, horse carts and hand carts. Between 1972 and 1974, they changed over to the production of tractor trailers, iron ploughs, levellers of land and other heavy agricultural equipment. The production of trailers and implements meant a definite change in the techniques of production. Work on metal like pressing, fitting, turning and welding came to predominate. Some machines, like a metal press, were made by themselves. In each family there was, and still is, a clear division of labour between the brothers and cousins. Some are responsible for the production of trailers and equipment, others are in charge of sales. So, in the beginning, the youngest of the four brothers of the Jeepwala family travelled on motorbike throughout south Gujarat, including the prosperous Bardoli taluka, to visit the villages and convince farmers to buy their products.

In 1990, each family 'officially' employs 9 to 10 workers in its workshop. They are Kolis, Dhodiyas and Dublas from Segvi, they are trained at the work spot. Some of the Dubla workers are from families who according to the Suthars, "belong" to their families for several generations. They live in the compounds of the Jeepwalas and Panchals.

In the early eighties the third generation of Jeepwalas and Panchals entered their family enterprises. The two families began to sell tractors. Till now the Jeepwalas have been more successful in this line than the Panchals. The former became the sole

selling agents of a prominent brand of tractors in Bulsar district. They were approached by a representative of this brand, because of their access to the farmers of south Gujarat.

"Initially we sold equipment, then tractors, now we sell tractors plus equipment", said the Jeepwala who has the responsibility of the tractor agency. He is a science graduate, educated in Bombay, and the driving force of the enterprise. The head-office of the agency is in Bulsar. It has a service-station near Gundlav, opened in 1987, and a branch office in Navsari, built on land which they bought a few years ago. One of his brothers is in charge of the service-station near Gundlav. A cousin brother, son of an uncle in Bombay, runs the agency in Navsari. In the near future the Jeepwalas will open a fourth office, for which they bought the land in 1990. The sales of tractors steadily increased between 1981 and 1990. In 1982 they sold 94 tractors, in 1989-90 the number was 125. One of the Jeepwalas stressed that in order to accommodate family members and to spread financial risks, diversification of interests is a must. Thus the family also traded in building material.

The family enterprise of the Panchals expanded too. Since 1982 they also own a tractor agency in Bulsar. It has a yearly turnover of about 25 tractors. In Bilimora they started a workshop for production of trailers, ploughs and other agricultural instruments.

The example of the Jeepwalas and Panchals again shows the close relation between agricultural development and the rise of local entrepreneurship from the ranks of artisans (Saberwal 1976: 19, 136, 137; Streefkerk 1985: 124, 257). When the Jeepwalas and Panchals started producing heavy agricultural implements and began selling tractors, canal irrigation in south Gujarat expanded. In 1990 it covered almost the whole of the district. With the increase of canal irrigation the mechanisation or tractorisation of agriculture advanced and heavier agricultural equipment can be used.¹ To stimulate this development the government assists farmers financially for the purchase of tractors. Farmers who own at least 8 acres of irrigated land are eligible for government support. In short, in a mainly agrarian environment, long term entrepreneurial success of urban Suthars and other artisans seem to depend on developments in the villages.

To determine the position of Suthars within the class structure of the urban agglomeration of Bulsar, a comparative research between them and members of other castes would be required. I have been unable to conduct such a time consuming investigation. Nevertheless, there remain other means to approach the subject and to present some information about the topic. The telephone directory of Bulsar is one of these means. As a telephone connection is a luxury, the names in the telephone directory indicate a measure of prosperity. The directory can be used to describe the contours of the economic elite within a certain area, to trace the material differences bet-

ween members of different castes and to outline the economic establishment within castes. However, this is possible only when surnames are the monopoly of a specific caste. The names of Mistry, Panchal and Sanghadia, used by Suthars in Bulsar, fulfil this condition.

Formerly, particularly in the villages, little use was made of surnames. Nowadays, surnames are common and they are instrumental in claims for higher status. Kumbhars (orig potters), for instance, call themselves Prajapati, Khatri (orig cotton weavers) are known as Kapadia (cloth merchant), and Bhangis (orig sweeper) often use the surname Solanki. Some names are so widely used by members of different first order social divisions, that they do not indicate, or rather hide the social background of its bearer. The surname Patel is an example, the name is used by Patidar, Kanbi, Koli and tribal categories such as Dodiya.

Most Suthars in Bulsar call themselves Mistry, which means 'carpenter/contractor'. Sometimes the name is used by others who are in construction business. In Bulsar, Suthars also call themselves Panchal, but they are a minority. Elsewhere, for instance in Bulmora and in central Gujarat, the name Panchal is found more frequently. The name Sanghadia is used by only a few Suthar families in Bulsar. Together with some well informed Suthars I checked the list of names and telephone numbers. It appeared that only six 'Mistries' were not Suthars. They are contractors, some of them are Muslims, one is a Koli.

According to the Telephone Directory 1988 (Valsad Telecommunication District 200, 201, 203, 208), there are 44 telephone connections among the 425 Suthar households in Bulsar and the adjoining villages, a 'density' of 10.8 per cent. The 44 connections consist of residential phones and phones in private offices. The number of connections in another artisan caste, the Kumbhars—called Prajapati and Lad—is 24. The 'density' among them is probably lower than among Suthars because there are more than 250 Kumbhar households in Bulsar.

The 'telephone density' among Suthars also has to be compared with the proportion of telephones among the groups who make up the economic establishment of the town. For this purpose I will use the number of telephone connections of the Anavils.

They use the surnames Desai, Naik and Vashi. In south Gujarat the name Desai is the monopoly of the Anavils and is most common among them. The name is also used in other parts of western India like Maharashtra. If there are such Desais in Bulsar, there will only be a few of them. The names Naik and Vashi are used only by Anavils.

There are 201 connections among 1,500 Anavil households in Bulsar and the adjoining villages (Telephone Directory 1988 Valsad Telecommunication District 184 187, 202, 217); a 'density' of 13.4 per cent. If it is assumed that there are a few non-Anavil Desais among the Desais in the telephone

directory, this 'density' will be somewhat lower.

The figures must be treated carefully. Since many years the Bulsar District Telephone Exchange has not been able to meet the many demands for connections as its capacity is limited. To present a more valid picture, the number of applications of Anavils and Suthars should also have been taken into account, but these data were not available. The little difference between the proportion of telephone connections of Anavils and Suthars may indicate the socio-economic prominence of the Suthar elite in Bulsar.

In 1974 I had concluded that despite its economic prosperity there was no equality between the Suthar elite and the Banias, Anavils and Parsis who belonged to the social and economic establishment of Bulsar (Streekerk 1985: 104). For instance, Suthars were not represented in the municipal council in those years. None of them achieved membership in the Rotary Club, the pre-eminently elite association in Bulsar. They were, however, well represented in the Lions Club which was—and still is—the club for the new elite of the town.

Between 1974 and 1990 they lost their monopoly over building construction and the first generation of industrial entrepreneurs vanished. However, they did benefit from chances offered by the economic expansion during the last decade, like the Jeepwalas and Panchals. In the social and political life of the town they continue to play a minor or subordinate role. In 1990 they are still not represented in the municipal council, nor in the Rotary Club. In the Lions Club they are represented in a prominent way. For many years the association was presided by a Suthar.

Wealth is unequally distributed among Suthars, there are considerable economic differences among the 425 households. Suthars themselves distinguish between four categories: (1) "well to do" households (40/50); (2) "not rich, not poor" households (140/150); (3) households which find it "difficult to pull on" (200); and (4) "poor" household (10/20). I will use this classification, though I concentrate on the extremes of the stratification. The estimates about the number of well to do families are confirmed by the information available through the telephone directory. The 44 connections belong to 38 households.²⁰ The most prosperous of these 38 families are still those in the building trade and the two families selling tractors and manufacturing agricultural implements. The economic top also consists of two families with furniture workshops, a family owning a large general store, and two ex-manufacturers of bobbins.

Suthars who are "neither rich, nor poor", are owners of small workshops like a garage, photo studio and shops, some of them belong to the 38 families with telephones. A large number in this category are government servants, railway personnel, or employees of private companies like Atul Products and its sister concerns. They often supplement their stable incomes by extra earnings from advisory jobs and administrative

work. They are part of the growing middle-class of Bulsar. They have their own houses in "Suthar streets", built around 1940 outside the old town, or occupy apartments in the new flats of the town.

Those who "find it difficult to pull on" can best be described as "skilled workers"—carpenters, fitters, turners, welders, or electricians. Their average monthly income is between Rs 750 and Rs 900 a month. They are employed by other Suthars, or they are skilled workers and supervisors in small-scale factories located along the roads outside Bulsar and at Gundlav and Vapi industrial estates. They live in the old and poor areas of the town in rented houses or in their own, old and dilapidated homes.

Though Suthars differentiate between those "who find it difficult to pull on" and households which are really 'poor', it is not always easy to draw a sharp line between both categories. Eight households of poor widows can indeed be distinguished from other poor households. Irregularity of income, and quality and pay of work in case of permanent tenure, are perhaps the best criteria to distinguish between the two categories.

Case 1. An example of 'poor' Suthars is of three brothers in three separate rented houses made of wood, bricks and iron sheets. The houses, in one compound, were rented by their father in 1940. They are located in the newer part of the town where many Suthars settled down in the thirties and forties. Their grandfather lived in the nearby village of Segvi where he was employed by the grandfather of the Panchals in Segvi. Their father came to Bulsar in the thirties. He worked in a large furniture workshop owned by a Suthar, who also came from Segvi. He had two brothers, one was an employee of a bobbin factory which was founded in 1945; the other expired at an early age.

The youngest brother earns a living by transporting goods with a hand cart. Among his customers are other Suthars, like the owners of furniture workshops. His wife is a servant in a Bania household. They have two small daughters.

Since many years, the second brother works for more than 16 hours a day, seven days in the week. He is a servant in a restaurant from 5.30 in the morning till 7 o'clock in the evening. From 8 to 11 at night he sells peanuts in front of a cinema theatre. His two sons, however, are better off. One is a civil engineer, employed in the government department in charge of the construction of a dam in a nearby region. He lives in a small town to the south of Bulsar, his wife works in a bank. The other son is an employee in a factory at Vapi.

The eldest brother, who is 50 years of age, does all kinds of carpentry work. Sometimes he makes tables and chairs and he is occasionally asked to make frames of doors and windows. He has two daughters and a son. His eldest daughter, who runs the household, works in an embroidery shop. His son is an attendant in a general store.

Case 2. In this example, the householder,

like his father, used to make harmoniums. As 'peti' is the colloquial word for harmonium, his name is Petiwala. He is about 70 years old. Petiwala's native place is also the village of Segvi. His father, married to a sister of the Panchals from Segvi, came to Bulsar to make harmoniums. It is not known where he learned the trade. Petiwala started as a carpenter in a furniture workshop in Bulsar. A few years later, he joined his father in making harmoniums. Petiwala's only brother was a carpenter in the railways. His son lives in Bulsar's major slum area, Shapurji Nagar, where he tries to make a living as a carpenter. Since 20 years Petiwala lives in shed together with his wife, a 42 years old daughter, who is a widow and a mother of a small child, and a mentally retarded daughter. His son expired. The shed is furnished with junk, it has no water connection and it is not rain-proof. It is the property of one of the richest Anavi contractors in Bulsar, who wants them to vacate the place. Before it shifted to the present site, the family lived in a house in the compound of a bobbin factory. They had to leave the compound because the Suthar owners required the space themselves. The household lives from the income of the widow, who is a factory worker at Gundlay industrial estate. She earns about Rs 300 a month, which is too little to live on.

The Suthars in above two examples are all from the village Segvi. This is due to the fact that Suthars from Segvi settled down in the same area when they came to Bulsar in the thirties and forties. It does not mean that poor Suthars descend from certain villages. The examples do show, however, the economic differentiation that occurred among Suthars who originate from the same native village and are close or distant relatives.

It is tempting to account for the differentiation among Suthars by pointing to social or economic inequalities already existing decades ago. For instance, the grandfathers and fathers in the above examples were employed by caste fellows in Segvi or in Bulsar. The economic position of their employers enabled their offspring to be more educated, to get better jobs, or contributed to their success as entrepreneurs. The histories of Suthars who are prosperous now, however, also show fathers or grandfathers employed by other Suthars. For instance, the father of the most wealthy furniture maker in Bulsar, and the father of the three brothers in the first example, both came from Segvi and were both employees in the same furniture workshop in Bulsar. The former started his own business in the forties, the latter remained an employee in the workshop.

This example shows that to explain why some families prospered, and others remained or became poor, individual variables should also be taken into account. They are of two types. The first pertains to personal attributes like intellectual capacity, craftsmanship, entrepreneurial abilities, and other psychological characteristics. The second type of individual variables I call "vicis-

situdes of life", like illness, death, and other small and large disasters which are beyond human control.²¹ In a society without social security provided by the state, they can ruin families and marginalise them within one generation. Petiwala and his family are an example. His father expired when he was young. He has been sickly during his whole life and his eyes are bad. His brother has been unable to help him. He lost his only son, his son-in-law expired, and his second daughter is mentally retarded. In other words, there is nobody to fall back upon.

SUTHAR STATUS

The economic progress among Suthars since 1900 has been accompanied by attempts to enhance social esteem by claiming a higher ritual status. The familiar conceptualisation called 'sanskritisation' connotes the change in life style by members of lower castes, 'untouchables' and tribals. The change consists of adopting modes of behaviour, norms, values and rituals which are considered characteristic of a higher 'twice-born' caste, that is to say, a caste belonging to the category of Brahmin, Kshatriya or Vaishya.²² To validate claims for higher ritual status they have to be supported by secular attributes of wealth and power. The process of collective improvement of ritual status and enhancement of social esteem is not a recent phenomenon. One way of conceiving Indian social history is to look at it as a permanent process of groups adjusting ritual status to their material strength and political power, and others who try to emulate the life style of their superiors. The gradual incorporation of tribals into the 'higher' Hindu social order in south Gujarat is an example of such a process.

Claims for higher ritual status of the artisans are not new. Mandelbaum (1970: 459) quotes accounts hinting at them in the 17th century and in the beginning of the 19th century. Saberwal (1976: 110) writes that from Ceylon in the south to Punjab in the north, during the late 19th and 20th centuries, artisan communities everywhere asserted the great importance of their deity Visvakarma, the lord of craftsmanship, and claimed to be of Brahmin descent. He calls it one of the few caste mobility movements which took a more or less parallel course throughout the sub continent.

I don't know when Suthars in Bulsar started to claim a higher ritual status. Their temple, dedicated to the lord Visvakarma, is at least 120 years old. Visvakarma, who is the craftsman of Brahma, is the builder and architect of the heavenly realm. The administration of a temple with a Brahmin priest is a direct means to enhance ritual status. In south India, carpenters together with goldsmiths, coppersmiths, masons, and blacksmiths, claim to be Brahmins of a special kind, descended from Visvakarma (Mandelbaum, 1970: 458). In Bulsar, Suthars say they are strict vegetarians, some of them wear the sacred thread symbolising their "twice-born" status, a certain amount of

dowry is not uncommon.

The establishment of the Panchal Pragati Mandal in 1948 in Bulsar is another indication of Suthar claims for higher status. The word "Panchal" the name of the organisation and as surname of some Suthars in Bulsar expresses the same. In south India the artisan jatis appropriated the common title Panchalla. "Panch" means five, the number of groups of artisans claiming to be Brahmins. In Bulsar, Suthars explain the origin of the name Panchal in the same way. Nevertheless, only Suthars and Luhars are permitted to become members of the organisation. Sonis (silversmiths), Kansaras (braziers, coppersmiths) and Kumbhars (potters) are not welcome.

The construction of the Visvakarma Hall in 1988 was another step towards organisational strength. The large three storeyed building accommodates the shrine of Visvakarma, it replaced the old, much smaller, temple building.

The construction of the building has been financed by a donation of a rich Suthar, who had been a building contractor. He had no issue and expired several years earlier. The building is located in the old part of the town, its site also belongs to Suthars.

The shrine of Visvakarma is in the big hall on the ground floor. In one of the rooms on the first floor is an office with several personal computers and printers. It belongs to a Suthar who undertakes information processing on behalf of its clients in and around the town.

The organisation of collective marriage ceremonies and the presentation of potential brides and grooms is the most recent way to demonstrate internal unity, mutual concern and organisational power. The two events are organised in Bulsar once in a year, during one meeting on the same day, by the Panchal Sewa Samaj.

The Samaj came into existence in 1983, when the administration of the Visvakarma temple and Panchal Pragati Mandal were brought together into one organisation. The reason to unite the two organisations was efficiency, the same people were active in the two organisations. The disappearance of the older generation of prominent Suthars, who had been active in the Panchal Pragati Mandal, might be another reason. The Samaj is administered by representatives of the younger generation of leading Suthars, like an architect, a furniture maker and the owner of a large general store.

Like the former Mandal, the Samaj supports widows, helps poor Suthar students to buy books, and offers sewing and computer courses, which are conducted in the new Visvakarma Hall.

In 1989 the Samaj organised the first collective marriage ceremony in Bulsar, a year later the second one was held. In 1990 the festivities, which included a meal prepared by Brahmin cooks, took place in the cricket stadium of Bulsar. Around 2,000 Suthar men and women attended the meeting, no other people were invited. Members of poor Suthar households, described earlier, also attended the meeting.

The total expenses on the festivities amounted to Rs 50,000; Rs 40,000 was spent on food. The expenses were covered by an entrance fee of Rs 75 per person. Each Suthar household in Bulsar received one ticket free of charge. Each family of the seven couples to be married during the ceremony obtained 25 tickets, 80 tickets were distributed among the volunteers who helped to organise the festivities.

The guests came from Bulsar and from other places in south Gujarat. They arrived on scooters and motor-bikes, in private cars and in rented buses. Among the guests were representatives of Suthar organisations in Bombay, Surat, Baroda and Ahmedabad and smaller towns in south Gujarat.

During the meeting in 1990 seven Suthar couples were married. The marriage ceremony was conducted by seven Brahmin priests. The couples were given all kinds of practical gifts by the Samaj.

Late in the afternoon 25 young marriageable Suthar men and women were presented to the visitors. Their names had been given to the Samaj by their parents or other family members. They sat on the stage in two rows, the men in the first and the women in the second row. While a member of the board of the organisation read out name, native place, age, education and source of income, the candidate walked to the front of the stage. Guests who were interested to arrange a marriage between their son or daughter and one of the candidates could contact the Samaj after the ceremony. The collective marriage ceremony and the presentation of marriageable candidates are noteworthy in several respects.

First, and foremost, the wedding ceremony and presentation signify the importance of maintaining the principles of arranged marriages and caste endogamy among Suthars. Second, the ceremony involves families who are not well off. Suthars explicitly stated that it was meant for people who could not afford a lavish wedding themselves. They were less outspoken about Suthars who participated in the presentation though background and native place of the candidates suggested they were not from prosperous families either. By enabling less well off caste members to marry their children according to Brahmin ideals, Suthars validate their claims to a superior ritual status. The idea that the community cares for its unfortunate members is honoured at the same time.

Finally, the festivities emphasise unity among Suthars despite considerable economic differences. They furthermore contribute to an identity that exceeds the local level. Representatives of other Suthar associations addressed the meeting and referred to their common origin. Long ago Visvakarma was ordered by Brahma to create the world. Suthars must do it now; they are his children.

EPILOGUE

During the eighties Bulsar and its environment changed more than the Indian and,

certainly, more than the Dutch sociologists had expected in the early seventies. The physical appearance of the town altered drastically and there were important modifications in its social structure. The physical changes and social trends are part of the state-supported capitalist transformation in India which, at least, in the coastal plain between 'Bombay and Baroda' has been the dominant development during the last two decades. The first type of change includes the unusual growth of population, the apparent urban features, and the welfare of many of its inhabitants. Major changes of the second type are the changed composition of the power structure and, above all, the emergence of a middle class.

The large influx of businessmen from cities like Bombay and Surat into south Gujarat and Bulsar is a major explanation for the differences between 1971 and 1990. These people were attracted by favourable economic and social conditions, such as the presence of several industrial estates in south Gujarat, the availability of cheap labour in the area and the comparatively low prices of land and houses in and around Bulsar. The immigration contributed to the spurt in building construction and the increase in all kinds of urban services and facilities.

The transformation of agriculture in Bulsar district has been another development which changed the town and its environment. The government completed the construction of canal irrigation. Its financial support enabled farmers to adopt new technologies and to cultivate more profitable crops like sugarcane. The composition of the class and power structure in the villages changed too. Prosperity increased among farmers who owned more than a marginal piece of land. The official efforts also meant a growing number of comparatively well-paid civil servants who work and live in the district headquarters.

The rise of the middle class is the most important change that occurred in Bulsar between 1971 and 1990. This class is made up of managers, professionals, owners of small industrial firms, small businessmen, shop owners, government personnel, employees of private firms, etcetera.

There are, however, some important continuities. One of these is the extreme difference in wealth and sharp social inequalities between different groups. The other is the division of the population into many groups with different life styles and ranked hierarchically on the basis of the Hindu idea of purity and pollution. Suthars are such a group. Their economic and social history, which I started writing in 1974, has been presented in more detail in this account. By portraying them I have been able to illustrate aspects of earlier and recent processes of social transformation in south Gujarat and Bulsar. The focus on them, furthermore, enabled me to trace some long term sociological trends.

During the first half of this century Suthars became an urban caste. This process implied occupational diversification and

economic differentiation. Upward economic mobility was realised by the gradual deviation from traditional skills. At present wealthy Suthars are no longer carpenters or blacksmiths. But often their occupations, such as building-contractor, architect, or manufacturer of modern furniture or heavy agricultural implements are an extension of their traditional occupation.

The most prosperous Suthars are not the most wealthy inhabitants of Bulsar, but they certainly are part of the economic elite of the town. A larger number of them belongs to the town's ascending middle class. They either own stores and small workshops or are government servants, railway personnel or employees of private companies. In these cases too their present activities are an elaboration of their ancestral craft.

Almost half of the Suthar households are at the lower end of the economic stratification. The heads of these households are employed as carpenters, fitters, turners, welders and the like. The poorest among them lack a regular source of income, they are self-employed or casual labourers. Some of them have to combine a poorly paid regular job with other sporadic earnings. Women of these poor families, for instance, contribute to the income of their households by working as domestic servants of well-to-do families.

Around 1950 economic mobility among Suthars was accompanied by the rise to political prominence of a Suthar who became the municipal chairman. But he did not set a trend between 1960 and 1990. Suthars did not play any important role in the politics of the municipality or in the wider political arena. But in the broader social life of the town they do play a more prominent role. They take part in 'social work' and offer donations. By doing so they participate in projects which symbolise increased welfare in and prestige for the town.

Suthars satisfy their quest for more social esteem by strengthening their ritual status. It is my impression that this trend became more pronounced during the second half of the eighties, when a large new temple was built and the first collective marriage ceremonies were organised. In other words, the study of the Suthars indicates the persistent if not increased importance of caste as an ideological and organisational frame. This conclusion perhaps surprises scholars who study South Asia with "unilinear theories of social evolution" (Washbrook 1988: 58). It might even disappoint Indian sociologists who documented the decline of caste because they experienced "opportunity and mobility" in their own lives and therefore focused on similar situations of mobility and change elsewhere (Saberwal 1979: 251).²³

Anthropological and sociological information collected through fieldwork during the last 40 years support the Bulsar findings. They confirm the importance of caste, though the information is largely based on rural studies (see, e.g., Bailey 1957, Dumont 1970, Kothari 1970, Harris 1982,

Raheja, 1988). Dumont considers the caste system as a timeless phenomenon based on the all-embracing opposition between purity and pollution and the ideology of inequality. Scholars without such a holistic view on Indian society maintain that the importance of caste increased during the last 150 years and that British Raj caused this development (Cohn 1970: 46; Fuller 1989: 38). Cohn (1968: 17,18; 1987: 224-255)²⁴ argues that British administrators formalised the existence of castes by their census operations. Washbrook (1988: 85) points to the strengthening of caste tradition through the force of Anglo-Indian Brahmin law.

Before and after independence caste groups certainly did improve their economic position, extend their political power, and raise their status through the use of new opportunities. In south Gujarat Anavil Brahmins were among the first to monopolise new educational facilities and occupations before 1900. Suthars were able to profit from economic changes later on. Kolis and Dhodiyas are examples of groups which recently captured economic possibilities in the villages and exploited administrative and political chances. What is noteworthy is not so much people's ability to take advantage of new opportunities but their success as caste groups, such as Anavils, Suthars, Kolis or Dhodiyas. When people failed it was, and still is, because they belonged to underprivileged groups, like Naikas or Dublas, which were not allowed or were unable to participate. The seizure of scarce resources, administrative influence and political power happened within the ideological order and structural frame-work of caste. It developed into an institution through which groups compete with each other for power and resources.

According to Srinivas (1979) co-operation and mutual dependence between different caste groups traditionally characterised the caste system in the villages. Thus in his view competition between caste groups is a deviation of "traditional" caste in India. But the distinction is not absolute: "Traditionally competition between castes -in the villages-did occur" sometimes and "even today agricultural production requires the co-operation of several castes" (1979: 242).²⁵

The emergence of huge caste groups, or 'horizontal stretch' (Srinivas 1979: 241), is another contemporary expression of the caste structure. Caste associations are a concrete manifestation of this tendency. They are urban phenomena, at least in western India. The earliest associations were formed in Bombay in the middle of the 19th century by migrants belonging to urban, upper castes from Gujarat. They then spread to towns in the homeland and among all castes. The primarily rural and lower castes were the last to form associations and that happened mainly after independence. All associations originated in large towns, are more active in towns than in villages and are led by prominent members in towns. Some of the associations, like the Gujarat Kshatriya Sabha, adopted political functions after the establishment of democratic polity after 1947. Most associations, like the Suthar

Association in Bulsar, continued to retain their non-political character (Shah 1982: 28, 29).

The administrators and politicians of the post-colonial state also have contributed to the strengthening of the caste structure and simultaneously articulated its importance. The best example is the policy to reserve posts in the legislature, government, and educational institutions for "Scheduled Castes" and "Scheduled Tribes". Recently "Other Backward Classes" (OBC) have been added to the people eligible for special treatment by the administration. In the official, political, scientific and popular discourses the term caste has replaced class. The substitution of terms suggests the predominance of caste over class as the most meaningful social category. The recent clashes over, or rather the "twice-born riots" (Omvedt 1990) against the announcement of the central government to implement the recommendations of the Mandal Commission, reveal the force of caste consciousness as determinant of sentiments and behaviour. The reactions of the upper castes cannot be explained by the threat of losing economic, social, or other privileges alone. At stake is the Hindu ideological order and the taken-for-granted divide between those of high and low status.

There are signs of an emerging class consciousness as part of the rise of the middle class in Bulsar. One such sign is the often heard "we, middle class people, suffer most from inflation because we have to maintain our life-style and customs against rising prices; poor people don't have these problems". The developments among the Suthars during the last decades, however, reveal a much stronger tendency. Economic mobility and prosperity among a minority of Suthars is expressed by heightened caste consciousness which is shared also by Suthars whose poor material conditions are similar to those of the majority of the population of the town. The identification with their caste might be even more important for them than for more well-to-do Suthars. It enables them to distinguish themselves from others who too are poor, but are ritually inferior and belong to groups with less or no social esteem.

My hypothesis is that the rise of the urban middle class is accompanied by the growth of caste consciousness among groups that constitute this class-in-itself. The popular agitation against, and intellectual commotion over reservations for scheduled castes, tribes and other backward classes, as well as the Hinduisation of Indian politics are to be understood as manifestations of this process.

Notes

[Dr S Devadas Pillai (Bombay) and Dr Rajendra Pradhan improved the English of an earlier version considerably. I owe much to them also for their critical comments.]

1 For more than 25 years south Gujarat has been studied intensively by Indian scholars and above all by Dutch sociologists and anthropologists. In the beginning of the sixties four of them, Baks, Breman, Hommes and Van der Veen, carried out fieldwork in the

rural areas of south Gujarat. Later on they changed their perspective from "local" to "regional" level. A new project was initiated and between 1970 and 1972 a team of Indian and Dutch researchers, based in Bulsar did fieldwork in south Gujarat. They covered a variety of fields and themes in order to trace and analyse processes of social change in the town and the surrounding area. The results of the Indo-Dutch research project have been compiled and published in Pillai and Baks (1979). Other publications based on research carried out between 1970 and 1972 include studies by Loes Schenk-Sandbergen (1975) on the sweepers of Bulsar, by Van der Veen (1975) on the joint-family, by Breman (1985) on migration and rural labour, and by Streefkerk (1985) on industrial transition in the region.

2 Bulsar district is known for the cultivation of fodder grass used in the cow stables in Bombay. Pardi taluka is proverbially known for its grasslands.

3 The shifting of Bombay enterprises to Gujarat could already be observed in the early seventies (Streefkerk 1985: 53).

4 Vapi is the biggest among several industrial townships in the southern-most part of south Gujarat, which came up between 1970 and 1990.

5 The official minimum wage for unskilled and agricultural labour is Rs 21 per day (Rs 630 per month). Employees in small or large private firms earn between Rs 1,500 and Rs 3,000 per month. A deputy executive engineer in the GIDC, who is a government servant, earns about Rs 4,000.

6 Bulsar reflects the fate of Parsis in India in general who, due to a combination of social and demographic reasons, are so to say a shrinking group.

7 Kolis are the largest 'first-order division' (caste) in Gujarat (Shah 1982: 11-15). In some areas of north and central Gujarat Kolis penetrated the lower Rajput rungs and claimed Rajput status. According to *The Gazetteer of Baroda State*, Vol I (1923: 218) in the south of Gujarat, Kolis were difficult to distinguish from the "Dubla, Dhodia and other stocks with whom (they) mixed". This statement, however, needs scrutiny.

In 1974 Kolis were important landowners. In many south Gujarat villages where the traditionally dominant landowning Anavils were absent, Kolis were economically the most powerful group (Streefkerk 1985: 214).

8 I use the term in a statistical manner to describe a category of people, a class-in-itself, with roughly the same income and consumer behaviour.

9 Table A gives the distribution of seats in Bulsar municipal council in 1971 and 1990 according to background of councillors.

author Age and gender are other determinants of people's status and someone's position in the social hierarchy Despite their importance they are not dealt with here

- 11 In his article 'The Rural-Urban Networks in India', A M Shah (1989) argues that urban growth in Gujarat since the 16th century led to a greater diversity of occupations in cities and smaller towns There were rulers, of rituals, soldiers and clerks, cultural specialists like scholars, priests or dancers, merchants, traders and bankers, artisans and craftsmen; and specialised servants The occupational diversification meant the existence of castes mainly found in towns Apart from these "urban castes" Shah distinguishes "castes found mainly in villages" and "castes found both in towns and villages" This division can also be used in studying actual phenomena
- 12 The tribal population in Bulsar district accounted for 54.5 per cent of the district's total population of 1,774,136 in 1981 (*Census of India, 1981, Part II B, General Population Tables, Primary Census Abstracts*, Ahmedabad, 1983: 118, 202)
- 13 According to A M Shah (1982: 4-6) the Hindu population should be divided in caste divisions of the first order like Brahmins, Banias, Rajputs, Kols, or Bhangis A first order can be divided into two or more second-order divisions Usually, the latter are distinguished from another by prohibitions of marital, but freedom of food, transactions
- 14 The characterisation of Luhars in the *Gazetteer of the Baroda State* (Vol 1, 1923: 208) is an example of how these ideas have been codified many years ago Luhars are said to be "strict vegetarians, except in south Gujarat where they secretly eat flesh and fish and drink liquor In blowing the bellows and in the lighter work, the Luhars are helped by the women of the family"
- 15 Elsewhere in India, for instance in the Punjab, carpenters also considered themselves superior to the blacksmiths (Saberwal 1976: 86)
- 16 Suthars, like Kumbhars (potters) which traditionally in villages belonged to the so-called 'service' castes, whose members were paid in kind (avat) for their services rendered to their 'patrons', the landowners
- 17 The railways still represent an important aspect of Bulsar's social and economic life Ever since the construction of the Bombay to Baroda railroad in 1860, the town has been an important stop on the line At the beginning of the century a loco workshop was set up, which still is in operation
- 18 Streefkerk (1985: 68-105) provides a more

detailed analysis of the transition from "handicraft to industrial production"

- 19 Mouluk and Mouluk (1989: 31) show the close relation between increased irrigation and tractorisation in Gujarat In 1961 the total number of tractors was 2,000, in 1972 14,400 and in 1982, 28,100
- 20 Table B gives occupation of Suthars with a telephone connection in Bulsar in 1988
- 21 See for e.g. Willem van Schendel (1981: 279) about 'nature and chance' as causes for short-term or long-term rise and fall of certain groups or even single families within the peasantry
- 22 See Srinivas (1962) and Mandelbaum (1970) for a more detailed treatment of Sanskritisation
- 23 Saberwal concludes his *Mobile Man* (1976) with the observation that the caste hierarchy in Punjab has softened further during the last decades (225) and that the caste system, its religious supports and caste solidarity declined in the town he studied (231)
- 24 To substantiate his argument Cohn (1987) refers to Ghurye (1969: 279) who wrote in 1932 that "(t)he total result—of the successive censuses since 1872—has been a livening up of the caste-spirit
- 25 In his article Srinivas opposes the idea of Leach (1960: 7) that "wherever caste groups are seen to be acting as corporations in competition against like groups of different castes, then they are in defiance of caste principles"

Delhi Rent Control Act: Facts and Fallacies

Kiran Wadhwa

Diagnosis of the problems created by the Delhi Rent Control Act (DRCA) is based largely on criticism levelled against rent control acts in general while amendments to the DRCA are based on the assumed impact it has had on the rental housing market. This assumed impact has not been empirically or analytically investigated. The present paper seeks to fill this gap and examines the impact of the act and the amendments to it on Delhi's rental housing market. The paper concludes with suggestions for reforms in the act.

ON the efficacy of the Rent Control Act (RCA) opinion is generally one sided and hostile to RCA for the negative impact it has had on housing markets and local finances. Despite the noises made for their complete abolition, governments have normally responded with marginal amendments as compromise solutions. The Delhi Rent Control (Amendment) Bill 1988, (DRCB) passed to amend the Delhi Rent Control Act, 1958 (DRCA) falls in this category. The DRCB, 1988 was passed in both houses of parliament and came into effect on December, 1988. The bill, propelled by changed circumstances has been proposed to achieve the following objectives:

- (a) to rationalise the present rent control law by bringing about a balance between the interests of landlords and tenants,
- (b) to give a boost to house building activity and maintain the existing housing stock in a reasonable state of repairs,
- (c) to reduce litigation between landlords and tenants and to ensure expeditious disposal of disputes between them.

The amendments to DRCA are based on the assumed impact which DRCA has had on the rental housing market. The assumed impact has not been investigated empirically or even analytically in the special context of operation of Delhi's rental housing market (RHM). The diagnosis of the problems created by DRCA and proposed amendments are based more on general criticism which is levelled against RCA. In this paper we examine the DRCA and the impact it has had on the RHM in the city. The problem solving ability of the proposed amendments is examined in that context. The paper is in four parts. Section I outlines some salient features of DRCA. Section II is devoted to analysis of the impact of DRCA on the RHM of Delhi. Section III introduces the specific amendments made in the DRCA and critically examines them in relation to the problems created by specific provisions of the DRCA 1958. Section IV concludes and offers some suggestions relating to reforms in RCA which may help in easing the situation in the RHM of Delhi.

I

Rent Control Act in Delhi

The first Rent Control Act in Delhi came into being after the outbreak of second world war in 1939. Currently the RHM of Delhi is controlled by the Rent Control Act of 1958 which came into force on February 9, 1959. The act was amended in 1976 and

then again in 1988. The area of jurisdiction of DRCA extends to all areas of Delhi.

The major provisions of the Delhi Rent Control Act (DRCA) relate to fixation of standard rent, conditions governing eviction of tenants and rules relating to maintenance of the premises by landlords. Under the DRCA (1958) the standard rent had been defined in relation to the cost of the house and was to be fixed at 7.5 to 8.25 per cent of the cost of construction of the house and the market price of land at the time of the commencement of construction of the house. In case the premises had been let out before June 2, 1944, the standard rent was fixed in relation to the 'basic rent'. In case the basic rent exceeded Rs 600 an increase of 10 per cent of basic rent was permitted. For premises constructed between June 2, 1951 and June 9, 1955, an exemption for seven years and for premises constructed after June 1955 for a period of five years was to be granted. The standard rent in these cases was the rent mutually agreed between the landlord and the tenant at the time of first letting. This rent would be valid only for the exemption period. Under the DRCA (1958) the rents could be increased only under certain circumstances.

The second set of provisions of the DRCA relate to protection of the tenant against arbitrary eviction. Section 14 of the DRCA (1958) provides nine grounds for eviction of tenants. These are: (a) non payment of rent, (b) illegally subletting part or whole of the premises by the tenant without prior permission of the landlord, (c) use of the premises for purpose other than that for which they were let, (d) non use of the premise by tenant or his family, (e) bona fide requirement of the premises by the landlord, (f) requirements of premises by landlord for carrying out repair, (g) requirement by the landlord for purpose of building rebuilding or carrying out alterations, (h) acquisition of alternative accommodation by the tenant, (i) misuse of the premises by the tenant.

Under DRCA (1958) there is special provision for short term tenancies also. Under section 21 of the act the landlord can rent out the premises for a period of up to two years at controlled rent. On the expiry of this period the landlord can take recourse to the court for evicting the tenant.

The DRCA enjoins on the landlord to provide minimum amenities to the tenant and maintain the tenanted premises in proper condition. Other provisions of the act relate to recovery of unlawful charges, compulsory issue of rent receipt by the landlord

and summary trial of certain applications for fast disposal of eviction cases.

II

Impact on Rental Housing Market

To understand the impact of rent control act on RHM, it is important to consider three aspects of value of the property: (1) the historical value, (2) the current value and (3) the replacement cost.

The DRCA—as is true of RCAs elsewhere—is based on the historic value concept while the landlords normally calculate the rate of return (ROR) either on current value or on replacement cost. Under inflationary conditions controlled rent gives a very low value of rate of return when calculated on current value or replacement cost. In fact, the way the DRCA is formulated it does not even assure a reasonable rate of return on the landlord's original investment. This is for three reasons: (i) a static value of what a reasonable ROR consists of, (ii) failure to distinguish between gross and net ROR, and (iii) equating investment of the landlord—in all instances—with the historic cost of the house.

Under DRCA, the rent was set at a level of 7.5 to 8.25 per cent of cost of the house in 1958 and has remained stagnant for 30 years. Meanwhile, the rates of return on other investments have moved up significantly. Further, a rent calculated at 7.5 to 8.25 per cent of the cost of the house would give a much lower net rate of return when account is taken of variable cost of renting like maintenance cost, property tax and income tax on rental income from property, etc. These costs have moved up over time and reduced the net rate of return still further. The rate of return will be still lower for a landlord who happens to be the second or third buyer of the house. The landlord's investment will far exceed the historic cost and consequently net ROR will plummet still further. The low rate of return on rental housing will have a negative impact on the supply of rental housing. In the case of Delhi however the impact has been diluted by various factors—the two most important being the exclusion of a significant part of the rental housing market from the purview of the act and relative ineffectiveness of various provisions of the act.

JURISDICTION OF THE ACT

Under DRCA 1958, the following tenancies were exempted,

- (i) properties belonging to the government

(ii) any tenancy created by a grant from the government in respect of the premises taken on lease or requisitioned by the government.

In addition newly constructed properties were exempted from the provision of standard rent for a period of five to seven years from the date of construction.

Properties in the informal markets (slum and squatter settlements and unauthorised colonies) though not 'exempted' under the act, are for all practical purposes outside its purview.² Ignorance about the existence of such an act and the reluctance to make use of its provisions will render the act ineffective in case of many other tenancies also. It can be safely assumed that ignorance and reluctance will be more a feature of tenants belonging to low income groups.³

If all the above 'exemptions' and 'exclusions' are taken into account, a significant part of RHM will be outside the purview of the act.

INEFFECTIVENESS OF PROVISIONS

The situation in RHM in Delhi is quite dynamic. Over a period of time, the behaviour pattern of both buyers and suppliers of rental housing has changed. The landlords have become 'wiser' and devised various methods of avoiding/evading the law. Thus renting of the house is done under the 'Transfer of Property Act' and a contract (lease deed) is drawn with the tenant. The period of lease normally ranges from 11 to 33 months. The lease is renewed at the expiry of the contract period and a new lease drawn, quite often at a higher rent. The rents charged in the market are rarely the standard rents. Apart from the tenancies which existed at the time the RCA came into being and in tenancies where the tenant applied to the rent controller for fixation of rent, the rents fixed would be higher than the standard rent. In most of the cases the rents will be the market rents prevailing at the time of initiation of existing tenancy. This is due to the fact that under the act there is nothing illegal about charging a rent higher than the standard rent.⁴ The standard rent is fixed by the rent controller only if the tenant or the landlord approaches the rent controller for this purpose.

Another way in which the act is made ineffective is through emergence of lump sum payments at the beginning of tenancy. These payments are illegal under the DRCA (section 5) 1958. The DRCA permits only one month's advance to the landlord. In Delhi's RHM, six months' advance or a deposit equivalent to six months' rent is quite common. Even when such payments have been made, the DRCA (section 13) provides for refund of these to the tenant. However, it may not always be possible for the tenant to prove that such a payment has been made. The act provides for compulsory issue of receipt by the landlord. This provision is also used by the landlord. In case of confrontation, the case of the tenant is significantly weakened if such a receipt cannot be produced in the court. Some of the landlords use non-issue of receipt as a precondition for

renting out.

The only provision which has been relatively more effective relates to protection of tenant against arbitrary eviction. Thus, RCA has been able to provide some security of tenure to the tenant. Security is provided not only in terms of strictness of causes for which the tenant can be evicted but also by lengthy procedures which discourage a landlord to go to the court for eviction. The landlord however takes recourse to various extra-legal methods to evict the tenant:

- (i) pay reverse 'pugree' to the tenant to induce him to vacate the house. As long as the amount of this reverse 'pugree' is less than the cost of fighting the case in the court and loss in rent in the intervening period and three years from the date of eviction,⁵ the landlord would opt for this alternative;
- (ii) use of force to evict the tenant. In Delhi, organised gangs take up this job. The going rate for this operation in Delhi is around Rs 50,000. The rate can be higher for houses located in posh localities. Recourse to this method is not as common as to the first.

There are risks involved in both the methods and success is not assured. Just as it is illegal for the landlord to accept a 'pugree' so it is for the tenant to do so and he can be punished under the act for accepting any unlawful payments (up to six months' imprisonment and/or a fine which may 'exceed' the value of reverse 'pugree' by as much as Rs 5,000). The tenant may therefore hesitate to accept lump sum compensation in lieu of vacating the premises.

Another way in which the landlord minimises the 'risks' of not being able to evict the tenant is by opting for low risk tenants. Persons with transferable jobs, companies and foreigners top the list of preferred tenants. In an analysis of advertisements of 'To let' columns of the Sunday edition of *The Hindustan Times* (January-April, 1988), it was found that 30 per cent of the advertisements (total number of advertisements analysed 1,597) specified company lease, 10 per cent specified embassy or foreign diplomat and 8 per cent bank employees as the conditions for tenancy. Sixty per cent of the advertisements registered some preference or the other.

The ineffectiveness or partial ineffectiveness of provisions of RCA however does not mean that the RCA has had no impact on price or supply or maintenance of rental housing in Delhi. The impact however is not as visualised in general criticism of RCA. The exclusion of part of the market from the jurisdiction of RCA and partial ineffectiveness of some of the provisions of the RCA resulted in segmentation of the market. This can be termed as the secondary impact of RCA. The total impact of RCA should thus be viewed in terms of its impact on each of the sub-markets separately as presented below.

SEGMENTATION OF THE MARKET

The existence of RCA has segmented the RHM broadly into three categories. These

are:

- (i) controlled market;
- (ii) semi-controlled market; and
- (iii) uncontrolled market.

Sub-markets (i) and (ii) theoretically fall under the purview of the RCA whereas sub-market (iii) is exempted. The difference between (i) and (ii) lies in the fact that the landlords in sub-market (ii) have succeeded in avoiding—at least partially—the impact of RCA, whereas the landlords in the first market have not been able to do so.

CONTROLLED MARKET

The controlled market consists mainly of two categories of houses (i) old housing units which were already rented when the act came into being; and (ii) tenancies where tenants have applied for fixation of standard rent.

In the absence of time-series data from the time of enactment of RCA till present it is not possible to estimate the size of the controlled market. In 1988 it could not have been a significant part of the total housing market of the city. First, a major part of the housing stock in the market is of post-1958 origin. Secondly, a very small per cent of tenants approach the court for rent fixation. Between 1971 and 1987, 2,953 cases were instituted with the rent controller in Delhi for fixation of rent. These comprised of less than 2 per cent of total cases.

A larger part of the controlled market will therefore be composed of older areas in the city. The housing conditions in these areas are very bad, the densities very high and amenities quite deficient. Most of this area has been declared slum area and protected under the Slum Improvement and Clearance Act, 1956. If the housing conditions in the controlled market are very bad, it is reasonable to assume that the upper income groups among the existing households will move out to better areas. This will reduce the size of the controlled market since new renting will be done not at the controlled but at the market rent. This shift, however, will not take place in case of tenancies in new colonies which have become posh locations over time.

It is argued that the RCA by fixing rent at less than market price leads to a decline in supply of rental housing through withdrawal of units. Low rents also presumably discourage new investment in rental housing and also lead to excessive use of space by tenant households. These arguments do not seem to be valid in the case of the controlled segment of RHM in Delhi. The supply of rental housing in the controlled sector is more or less frozen. The reason lies not in landlords' unwillingness to withdraw units from the market but in their inability to do so. An indirect evidence of this is seen in the large percentage of rented dwellings in central Delhi. In 1987-88, 71 per cent of the dwellings were partly or fully rented in this area. For the whole of Municipal Corporation of Delhi the percentage was 33. Increase in supply of rental housing in this market is possible only when tenants approach court and get a fair rent fixed. The net impact of RCA on the supply of rental housing in this market will therefore be very insignificant.

As for excessive use of space in the controlled market, this might be true of some of the new colonies in the city but does not seem to hold true for old parts where densities are as high as 600-1,200 persons per hectare. In these parts if market rents are charged the inhabitants of the controlled market may find these houses unaffordable and shift to some housing which is even inferior to existing housing.

The most important effect of RCA in these markets is of deterioration of housing stock due to lack of maintenance. The low rate of return from renting out may not lead to a decline in number of units, until due to accelerated obsolescence, the units die a premature death. The supply of rental housing (services) however declines even in the absence of such an occurrence in two ways; (i) increasing age; and (ii) decline in flow of services which the house can offer.

SEMI-CONTROLLED MARKET

The semi-controlled segment of the market incorporates the newly constructed properties which are partially exempted from the purview of the act for a limited period and other properties which though legally under the purview of RCA, manage to avoid many of its provisions. The most important provision being evaded is that of fixation of standard rent. A rent higher than 'fair' rent is charged either on a monthly basis or in the form of key money at the beginning of tenancy. The rent will be the market rent prevalent at the time the house is being rented.

Over time, the rents of these properties became lower than the current market rents under inflationary conditions. The RCA protects the tenant against arbitrary increases in rents. The reaction of the landlord of the older tenancies is the same as that of the controlled market. A rational landlord will like to increase the rent and failing that will try to evict the tenant so that the premises can be rented out afresh at market rent. There are difficulties in achieving either of the two ends.

A sizeable proportion of Delhi's Rental Housing Market falls in the category of semi-controlled market. The exempted component itself is 19-20 per cent of the total rental housing stock.⁶

The units in the semi-controlled market may shift to the controlled segment in case the tenant applies for fixation of rent. The landlord however may escape the clutches of RCA through informal channels. Some landlords may withdraw their rental units from the market rather than adopt illegal means to raise the rate of return on their housing units. Others may not. Still others may continue to supply the unit willingly, due to their inability to opt out of the market or evict the tenant, and continue to accept a low rate of return. The impact on supply of rental housing in this segment will depend upon the composition of landlords in terms of proportion of risk-takers to risk-averse. It however, cannot be denied that the provisions of RCA are daunting enough to scare

the 'weak' landlords. On the other hand, this must also be noted that for the act to be operational it is also the tenant who has to go to court, hire a lawyer and appear every time a hearing is scheduled. The opportunity cost of time and money spent cannot be insignificant for the tenant either. The tenant also may not desire to be involved in any complications and therefore agrees to pay the market rent. Landlords will favour such tenants who cannot 'afford' to go to court.

The decline in supply of rental housing in this market comes about mainly through conversion of units from rental to ownership status. There is no direct data available on this. The number of eviction cases instituted with the rent controller and decided in landlords' favour can be a good indicator of this conversion. Between 1972 and 1978, a total of 56,908 cases were registered for eviction. Assuming that 25 per cent of these were decided in favour of the landlord⁷ a total of 14,227 houses or approximately 890 houses per year would have been withdrawn from the RHM of Delhi—if not permanently, at least for a transitional period.⁸ During the period 1971-81, approximately 1,37,544 new units or 13,754 units per year had been added to the RHM in urban Delhi. Thus, despite a withdrawal of a few units per year the net supply of rental housing has continued to increase.

As old units leave the market—and some of these also may re-enter the market after three years—new ones enter the market. It is quite possible that a larger part of the new units belong to the semi-controlled market.

UNCONTROLLED MARKET

The uncontrolled market comprises of (i) government properties, (ii) sublet government houses⁹ and (iii) low income properties, which are outside the purview of RCA due to ignorance on the part of the tenants and/or the landlords.

The size of this segment varies. Whereas both (i) and (ii) continue to be in the uncontrolled market due to legal exemption, the tenants and landlords of low income properties can take advantage of the act and shift to the controlled market. Below we attempt a rough estimate of the size of this segment in Delhi's rental housing market in 1981 based on data available in the census, and that provided by the DDA.

SIZE OF UNCONTROLLED SEGMENT

DDA has provided information on the number of households living in different types of housing, namely, squatter colonies, employer housing, unauthorised housing, etc, for the years 1961, 1971 and 1981. If we assume that the density of households per dwelling is the same for all housing types, we could interpret this data to give us distribution of dwelling types. According to the available data, 6.27 per cent of housing in Delhi in 1981 was government housing. Assuming that 50 per cent of this housing is sublet (partly or fully) it would add approximately 3 per cent to the uncontrolled

segment of the RHM. The remaining 3.27 per cent of housing was squatter settlements or inhabited by low income families. This would bring the total uncontrolled segment of the market to approximately 28 per cent of the total private sector housing market in the city which is a significant part of the total housing market. If we were to add to this housing—the unauthorised colonies, another 1.7 per cent would fall beyond the purview of the act.¹⁰

The existence of RCA in some segments of the market and consequent impact on supply would lead to higher rents in the uncontrolled sector than would be the case in the absence of RCA.

The total impact of Rent Control Act on the RHM would depend on the composition of the RHM in terms of controlled and uncontrolled segments. If a large proportion of the market is uncontrolled, the impact will be insignificant and vice versa. The present RCA in Delhi came into being in 1958 and has been in operation since 1939 in some form or other. The landlords of Delhi have had sufficient experience/expertise in devising ways and means to circumvent this act. A large part of Delhi's RHM would therefore fall in the semi-controlled category. A very small part would be controlled. As pointed out above, within the semi-controlled market, the impact depends upon the degree of perceived risk in renting out and whether the landlord is a risk averter or a risk taker.

The RCA in Delhi may not have had as significant an impact on supply of rental housing in Delhi as in creating a black market and various other distortions in the RHM. The government, however, in its conventional wisdom diagnosed the problem mainly as that of reduced supply of housing and of increased discord between landlords and tenants and introduced amendments to DRCA 1958 in May 1988. These amendments became effective from December 1988.

III

Major Amendments

In line with the diagnosis of the problem and stated objectives, the amendments have been directed towards increasing the supply of rental housing—from existing as well as new stock of housing. The amendments have also tried to tilt the balance a bit in favour of the landlord by permitting increases in rent, facilitating eviction for certain classes of population and increasing the scope of exemptions.

Believing that RCA was a major deterrent to the supply of rental housing, the DRCA (1958) exempted a few more classes of properties from the purview of the RCA. These include properties with a monthly income rental of Rs 3,500 and above and newly constructed properties for a period of ten years. For existing properties and for properties with a rent of Rs 3,500 or less the inducement to increased supply has been given in the form of increased standard rent. The

7.5-8.25 per cent to 10 per cent of the cost of the house. Further, the standard rent can be increased by 10 per cent every three years.

Under the amended bill there is an increased penalty for non payment of rent and for not vacating limited period tenancy. In case of default of rent, the tenant is now liable to pay, in addition to the rent, simple interest at the rate of 15 per cent per annum from the date on which such payment of rent is due to the date on which it is paid. Further, for not vacating a limited period vacancy the controller may award to the landlord such damages for the use or occupation of the premises at such rates as he considers proper for the period from the date of such order till the date of actual vacation by the tenant.

On the other hand, there are increased penalties in case of landlords violating the provisions of the act also. Thus, the penalty for reletting the house within three years of eviction has been increased to imprisonment up to six months from three months earlier.

Under the amended act, eviction of the tenant has been made easier for certain groups of population. Thus, for persons retiring from Central government services, Delhi administration and armed forces the amendments provide for right to recover immediate possession of premises. For other classes of landlords eviction has been made more (rather than less) difficult. One of the valid grounds for eviction under the DRCA 1958 was building of a house by the tenant. This no longer is a sufficient condition under the amended bill. Under the amended clause the tenant is permitted to continue his tenancy for a period of 10 years even after building the house. Increased penalty for reletting within three years of eviction also makes eviction more risky.

The question of amendment or even complete abolition of RCA has been hanging fire for long. The Economic Administration Reforms Commission, set up by the government under the chairmanship of L. K. Jha, came out with specific suggestions to reform the RCA in 1982. The National Commission on Urbanisation, in its interim report in 1987 also gave some concrete suggestions in this regard. In view of all this long term activity on the part of the government, it is surprising that the present DRCA 1988 falls short on so many counts. Not only do the amendments touch the mere fringes of the problem which can be explained in terms of political factors, but some of the amendments lack clarity and will lead to greater distortions in the market. The ability of these amendments to improve the situation in RHM, even in terms of stated objectives is highly suspect.

SOME ANOMALIES

The amendments which cause maximum confusion relate to the exemption of high rent (above Rs 3,500 per month) properties from the purview of the Rent Control Act. The amendments do not specify whether the rent being referred to is the rent currently

If it is the latter, what are the implications for tenancies whose market rent is greater than or equal to Rs 3,500 per month but where the tenants at present are paying a rent lower than the market rent? Presumably, the landlords of these properties can now increase the rent to the market level and/or evict the tenant under the Transfer of Property Act. The amendment is going to lead to greater discord between the landlord and the tenant. Even if it is clarified that the rent being referred to is market rent, the question is how is the market rent to be ascertained. This amendment by itself will lead to even greater litigation defeating one of the objectives of the bill.

Another amendment lacking in clarity is the one relating to the permitted increase in the rent of 10 per cent every three years. Can the increase be interpreted as 3.33 per cent increase every year or does it imply that the rent can be increased by 10 per cent only at the expiry of three years? If latter is the case then short term tenancies with a duration of less than three years tend to lose out. Assuming that the RCA is strictly adhered to with respect to controlled rent, everytime the landlord rents the house afresh, fair rent will be calculated at 10 per cent of the cost of the house and no increases will be permitted. This provision will introduce anomalies in the rent structure of similar houses in the city. Landlord of older tenancies will be better off. The tenants too under these circumstances may prefer to shift houses before three years are over and the increment becomes due.

Again there is no clarity relating to the date from which the increments are to be calculated, especially for existing tenancies: from the first year of tenancy or from the date the bill became effective? The government should issue clear guidelines in this respect to avoid confusion.

A curious feature of the bill is the partisan attitude shown to tenants who have built their own houses in permitting them to remain in the rented house for another 10 years. The rationale underlying this relaxation is beyond comprehension. Read in conjunction with the exemption granted to newly constructed properties, this clause would permit the tenant owner to have his cake and eat it too. For the first 10 years of a newly constructed house when the RCA is not applicable, the tenant can rent out his house at remunerative rent while continuing to enjoy protection of RCA in his existing tenancy. This amendment specially favours tenants who build house on or after December 1988.

The government's partisan attitude is reflected in making eviction easier for certain classes of population is not easily explainable except that it favours its own employees namely government servants.¹¹ The specific problems of government servants could have been taken care of under the existing provisions and there was no need to introduce additional clauses in this respect. Thus, section 14A of DRCA 1958 extends the right to recover immediate possession of house to

had to vacate the house allotted to them by the government. Again, the special needs of persons with transferrable jobs also could have been taken care of under the existing provisions relating to limited period tenancy by extending the applicability of this clause from two years to the period of transfer.

In permitting tenants to hold on to their existing tenancy even after building their own houses and in assuring eviction of the tenant (at least to certain classes of landlords) the government's implicit objective seems to be to encourage supply of housing by existing tenants and potential landlords. If so the government does recognise the significance of ease of eviction as a factor influencing supply of rental housing. By limiting this amendment only to a small group the impact on total supply is going to be very small. So will be the impact of other amendments.

LIKELY IMPACT OF AMENDMENTS

The amendments are not likely to have any significant impact either on the supply of rental housing, or on the maintenance of housing stock or, on relationship between the landlord and the tenant. A rent calculated at 10 per cent of the cost of the house and increasable by 10 per cent every three years is not going to improve the rate of return from housing much. Going by the protests made by the tenants over these amendments even these increments are not going to be easy to bring about in old tenancies.

The supply of rental housing in the high rental (uncontrolled) sector might increase. The demand for this kind of housing, however, is bound to be quite low for two reasons:

- (i) The low percentage of population which can afford this type of rental housing. Assuming that a household spends around 20 to 25 per cent of its income on rent, the lowest income for a household to be able to afford a rent of Rs 3,500 will have to be in the range of Rs 15,000 to Rs 17,500 per month. The number of such households in Delhi would be a minuscule proportion of the total number of households in the city.
- (ii) The low preference for rental housing by the high income groups. These groups normally go for rental housing only if they plan to stay in the city for a short period. Proportion of such households in the total population of the city can not be very high.

The increased supply in the face of stagnant demand in the segment may lead to a decline in the level of rents. This will however not benefit the lower income groups who are the major buyers of rental housing services. These groups opt for rental housing because they cannot afford ownership housing. If the assumption that RCA leads to a reduction in supply of rental housing is correct, then the situation for this section of population will continue to be as 'difficult' as before. The amendment may thus benefit a very small section of population. The amend-

most disturbing high income properties from the purview of RCA is more understandable if the objective is to reduce pressure on the rent control department. The number of such cases however cannot form a high proportion of total number of cases in court.

The exemption of new construction from RCA for the first 10 years is also directed to encourage supply of housing for renting. An analysis of the rates of return from rental housing brought out the fact that even if the landlord charges market rent, returns from renting out are very low [NIUA: 1989]. Mere exemption of properties from the RCA is not going to increase the supply of rental housing in the market. Even if supply increases, this may be only transitional and households may withdraw the unit from the RHM at the end of the exemption period.

The ultimate objective of increased supply is to lower the level of rents. It is a moot question whether the rents will really decline—even if the amendments have the desired impact. In case of supply out of new construction, it is possible that to make up for the probable loss of income when the unit enters the controlled market the rents of transitionally exempted properties may be jacked up. Further, in a given year the addition to housing stock and specially rental housing out of this stock is not going to be very significant. The impact on rentals of these meagre additions cannot be significant.¹²

High price of housing is not specific to the RHM but extends to the total housing market. The high value of houses in Delhi reflects not only the low supply in relation to demand for housing but also the high replacement cost (production) of housing. In Delhi the value of houses has increased at rates much faster than those of rents [NIUA: 1989]. If rents were to be taken as a return on investment calculated at current market value or replacement cost, a reasonable rate of return even at 10 per cent—the percentage prescribed under the DRCA 1988—would imply a high level of rent.

As for bringing a better balance between landlords and tenants, the RCA is still biased in favour of the tenant. The major irritant to the landlord is restriction on right of eviction. The provisions for eviction have become even more restrictive than earlier. The amendments are not likely to lead to any decline in litigation. If the decline occurs it will be either because the landlords increasingly take recourse to extra judicial measures or, given the inefficiency of the system they have no option but to continue the *status quo*.

IV

Reforming Rent Control Act

The Delhi Rent Control Act was conceived as a short-term measure to take care of scarcities in the housing market in the aftermath of second world war. As such, it might have been successful in the short run in controlling rents. The RCA was not intended to be a long-term measure. At the time of its imposition, it was assumed that in the long run,

as and when the supply of rental housing increased the controls would be discontinued. The supply never did improve and DRCA has continued to be operative for over 50 years now. A short-term measure like DRCA cannot be used to take care of long-term problems unless it is adjusted frequently to adopt to the changes taking place in the market. In fact, this is what accounts for the ineffectiveness of DRCA in Delhi. Over time, the market has adjusted to RCA and found its own solutions. The emergence of an effective and efficient black market in rental housing had added to distortions in the economy created by RCA in the first place. On a positive note, it is these practices which have blunted the negative impact of RCA on RHM also. The fact that RCA does not have significantly negative impact on supply of rental housing however cannot be used as an argument for its continuation. The cost to the economy, in terms of distortions created and mechanisms devised to beat the system, has been very high. The benefits, in comparison have been too small and confined to a very small segment of population. The abolition of RCA will remove these distortions. Whether it will be able to improve the situation in RHM is a moot point?

ABOLITION OF RCA

Critics of RCA all over the world have recommended abolition of the act. It is argued that abolition of RCA will improve the supply of rental housing and lead to a decline in rents in the long run. In Delhi's RHM where RCA has had only marginal impact on supply of housing, its abolition cannot increase this supply significantly nor lead to a decline in the level of rents. Whatever increases occur in supply, will originate mainly from risk-averting landlords who had held back the supply of rental housing due to RCA. Even here the impact on supply would depend upon the perception or expectation of landlords regarding probability of reimposition of RCA. In a city where RCA has been operative for the past 50 years, the psychological fear of its reimposition is going to be very high. The existing landlords (especially of old tenancies) however may make use of this expectedly transitory period to evict existing tenants and either sell the property or re-let it after taking all precautionary measures.

If RCA is abolished and the market is left to itself, the average rent in the market is going to be even higher than is the case at present. Market rents in Delhi move with the value of houses and given the high value of houses rents will be very high. The basic problem of high rents as cited above is of low supply and high cost of housing and not of scarcity of rental housing alone. Solution to the problem thus lies in increased supply of housing at reasonable cost. This however is a long-term solution. In the short-term, either one is to accept high rents or continue to have some type of rent control. An abrupt abolition—temporary or permanent—is likely to cause great dislocation in the market.

Apart from that, it is not going to be possible politically for the government to do away with RCA altogether. It should however be recognised that the current RCA has outlived its utility. The various amendments based on symptomatic diagnosis merely impose another superstructure of rules and regulations leading to more complications. What is required is a fresh look at the RCA in line with the new realities of market place. The experience with DRCA over the past 50 years can be a useful guide for formulation of a reformed RCA.¹³ In formulating such an act it is very important that there is clarity of objectives and effort is made to achieve these objectives. The existing DRCA falls short on this count. In case of DRCA 1958 the major objective was defined as protection of tenant through ensuring reasonable rent, provision and maintenance of services and guarding the tenant against arbitrary eviction. The act, however does not strictly enforce the requirement of a fair rent. Greater importance has been given to imposing restriction on eviction of the tenant.

These provisions have in fact indirectly helped in controlling rents. In fact, this has become a major irritant to the landlord as it is seen as a major obstruction in raising rents. If the policy objective of intervention in the RHM is to maintain rents at reasonable levels, then the government has to formulate an explicit policy in this regard.

Judging by the experience with RCA in Delhi's RHM it might be better if the reformed RCA gives greater emphasis to maintenance of reasonable rent and makes eviction little less difficult. The existing RCA protects the tenant but it ensures neither a fair rate of return nor, reversion of the property to the landlord as and when required. There is need to take a more balanced view of the situation. The tenant must be protected against arbitrary eviction and exorbitant rents. Meanwhile, the landlords must also be ensured a fair rate of return (taking into account all the costs of renting over a period of time). Further, if the Constitution recognises the right to ownership of property, the right of the landlord to exercise his option either to rent it out or not, or to rent it out to a particular individual should also be protected. There is however need to remove arbitrariness from these decisions. A *via media* is proposed taking into account the interests of both the tenant and the landlord.

RATIONALISING RENT CONTROL ACT

The major problem faced by the tenant is uncertainty regarding duration of tenancy and future level of rent. There may be no objection to paying the market rent if the tenant can be certain of the stability of this rent or the security of tenure at least for a few years. The landlord again may not be looking for a rate of return comparable to that earned by equity of bluechip companies, and may be agreeable to a lower rate of return if retrieval of property is assured—if not as and when required at least after a specified period. Thus, a rational solution

obligatory under a contract. The terms of tenancy, namely, the period of tenancy, the mutually agreed rent and the proposed increases in it should be clearly spelt out in the contract. The normal tenancy should be for a period between five and seven years. If the landlord wants possession of the house prior to that period, a year's notice or compensation in terms of a specified sum should be given to the tenant. This will remove any arbitrariness in eviction procedures and will give sufficient stability to the tenant. After the expiry of the contract, if both landlord and tenant are agreeable, a new contract can be drawn up. This step will not only induce the risk-averting owner to enter the rental housing market (by reducing the risk of losing the house) but also increase the supply from landlords who want to rent out for temporary periods.

The protection of the landlord (in terms of assurance of the court for eviction of the tenant) should be linked with registering the tenancy with the rent controller or rent administrators and with the charging of a fair rent.

An important issue which the government will have to tackle relates to the definition of a fair rent. Fair rent can be defined either as market rent or a rent which besides giving a 'reasonable rate of return' to the landlord also covers all the variable costs of renting. Whereas it is possible to exactly quantify the variable cost of renting, reasonable return is a very nebulous concept. The nebulousness arises due to different values which the variables determining this return can take. These variables are: (1) base on which the rate of return is to be calculated. Should the base be actual cost of the house, or replacement cost of the house or its current market value? (2) the definition of reasonable rate of return. Should it be equal to return on long-term government securities or on equity of blue chip companies or, average rate of return from other long-term investments, etc?

It is clear if the base is taken as the current market value or replacement cost of the house rents, even if a relatively low rate of return is chosen, will be very high. On the other hand, fair rents calculated on the basis of actual cost, especially of old houses will give very low return. A via media will have to be found. We suggest using actual cost of the house as base and, the rate of interest on long-term deposits as a reasonable rate of return.¹⁴ This will give fair rent for the base year—that is the year in which the house was constructed. This rent then should be inflation indexed. While inflating the rent, care should be taken that the property is well maintained, otherwise the estimation of economic base should consider depreciation of the property. The rate of return so calculated will take account of inflation but not of increase in market value of the property due to locational factors. As has been observed from the reaction of tenants to moderate permitted increases under the current amendments, it would be very difficult to put this principle into effect in case of old

tenancies. A lower rate of increase in rent in case of older tenancies might be recommended. Another alternative might be to make reformed RCA applicable only in case of post-1960 or post-1970 tenancies.

As mentioned before, rent control is not a long-term measure and cannot solve the long-term problem of rental housing. The government should have well defined long-term and short term policy. In the short-term, one can have a limited kind of rent control which should gradually give way to market forces. This should be supplemented by the long-term policy of the government directed towards increasing the supply of housing at reasonable cost. The government should take specific measures to encourage production of housing for renting.

Notes

- 1 Basic rent is defined as either rent which was fixed under the earlier Rent Control Acts or rent at which premises were let out on November 1, 1939; or rent at which premises were first let out after November, 1939 but before June 2, 1944.
- 2 Tenants living in slums are covered under the Slum Areas (Improvement and Clearance) Act for certain provisions. According to the rent controller, Delhi, tenants living in unauthorised housing can take recourse to the RCA. These groups however may not be aware of their rights.
- 3 The opportunity cost of going to court is very high and low income groups and the service class can ill-afford it. Further, legal illiteracy among the low-income groups is very high.
- 4 The DRCA 1958 recognises the rent agreed between the landlord and the tenant as legal.
- 5 If the eviction is on bona fide grounds the landlord is restricted from reletting the house till three years have elapsed.
- 6 Between 1971-81, a total of 3,84,097 new residential and residential-cum-non-residential houses were added to the existing housing stock in Delhi. Assuming an even distribution of new construction over this period, a total of 1,92,049 houses would have come up between 1976-81 which would be exempted from RCA. These make approximately 19.19 per cent of the total housing stock in 1981.
- 7 This estimate is based on number of cases decided in favour of the landlord from a sample of 173 cases, data for which was obtained from the rent controller. "Ic."
- 8 This is a very rough way of estimating the withdrawal of houses from the RHM due to RCA. The landlord may not have to take recourse to the court (every time) for evicting the tenant. Further, in some cases of eviction the unit may be relet. The ban on reletting is restricted to cases where eviction had been sought for self-use.
- 9 Even though these properties are out of the purview of RCA by being government pro-

perties, the subletting of these properties makes them part of the private sector supply of rental housing.

- 10 Even though tenants of unauthorised colonies are protected under the RCA, according to the chief rent controller, Delhi, the illegal nature of these colonies may inhibit the landlord/tenant from approaching the courts. A perusal of active files in the rent controller's office revealed an almost complete absence of cases from such colonies. There were a few cases from colonies which have been regularised by the government.
- 11 As it is government servants are doubly blessed—they enjoy government accommodation during their tenure with government at subsidised rents while continuing to rent their own house at a higher rent. In 1963, the order banning provision of government accommodation to house-owning officers was rescinded.
- 12 In a particular year new housing added accounts for approximately 2 per cent of the existing housing stock. Even if 50 per cent goes for renting, the increase in rental housing supply cannot be very high.
- 13 One should however be careful about jumping to naive conclusions. Thus, the fact that restriction of the right to evict the tenant has been a major irritant and obstruction to supply of housing by the landlord does not imply that removal of this irritant will solve the problem. What it will accomplish is making the current act completely ineffective. In that case it will be much better to abolish the RCA as such than to have the pretence of a regulatory act.
- 14 It may be argued that the bank rate on long-term deposits is not a fair rate since whereas the value of the deposit declines over time, the value of house normally increases. The landlord would thus be earning a rate much higher than the bank rate. We hold that the appreciation in the asset value of the house should not be taken into account while calculating the rate of return. This appreciation is notional till the landlord sells the house and should be taken care of at that point of time rather than reduce the rate of return for a landlord who would never sell the house.

Indigenous Social Science

Neera Chandhoke

SARAH JOSEPH in her interrogation of indigenous social science (*EPW*, April 13) has raised certain very crucial points as regards the internal logic of the project. The argument needs to be extended and expanded because it has important theoretical, methodological and political implications of concern to political theorists as well as to those of us who are engaged in comprehending the post-colonial world. One issue that has come up repeatedly in at least my teaching and study of this world to the appropriate theoretical tools that can be employed in this enquiry; whereas there is concern, even scepticism, over 'received social science methods and their relevance to our societies', no genuine alternative seems to have emerged from the proponents of indigenous social science. This brings the entire question of universal vs particular social science to the centre of methodological debates. Theorists of indigenous social science hold that what passes off as universal social science is Western social science, born out of the specific historical experience of Europe and globalised by the colonial intervention and the structures of neo-colonialism. There is no gainsaying that the globalisation of capital has also globalised modes of enquiry originating in the West. This was the particular case with the modernisation theory that pervaded academia and the centres of decision making in the Third World in the immediate aftermath of independence. The point is, do we reject or relinquish theory because of its spatial origins? In other words, do we assume that theories possess or do not possess certain properties only because they are the products of specific historical conditions? By this logic Gandhism is peculiarly suited to be practised only in India because it arose out of the Indian experience—when most liberation movements have acknowledged not only the inspiration provided by Gandhism but also its relevance for national liberation politics and for techniques of resistance.

The point is that all societies are sites for plurality of theories, each of them arising from similar conditions and historical trajectories. Yet as systems of representation, their preoccupations, in their prescriptions they occupy different theoretical and political spaces. Each spatial setting then becomes the terrain of contestation between theories claiming to represent reality in an authentic fashion. Marxism was born out of the same conditions as Liberalism, yet it merged as an antithetical social science and rescribed antithetical political practices. Marxism could occupy a radically different

position because the questions it asked, the concerns it focused on, the problems it posed, the contradictions it brought to the centre of analysis were different; therefore, its solutions were distinctive. It interrogated and expanded existing theory and thereby effected a shift of the epistemological terrain. Theories are not distinguished solely by their spatial settings, but by their normative structures and their concerns. The location of the practitioner in the same theoretical and normative space, irrespective of his/her spatial location, makes for universality. Surely a radical feminist concerned about the triply oppressed dalit woman worker is as concerned about the woman worker in South Africa, oppressed by race, class and gender; and the Latin American woman worker similarly triply oppressed in the sweat shops of the USA. It is this shared concern, this perspective that locates a feminist in a radical tradition. Comparative political enquiry has shown us that if there is a universal human condition, it is that of domination and if there is a universal human reaction, it is that of resistance. A theoretical tradition that raises these questions to the forefront of analysis makes for relevance and thus universality.

Secondly, every theory has specific properties as well as universal properties. The commonality of the questions raised, the problems addressed gives universality; the answers make for specificity and for political practices relevant to that society. Mao, Cabral, Fanon, Machel were located in the Marxist tradition, yet the practices they prescribed for their societies were distinctive. The postulation of specific practices appropriate to their societies and their history were within the same epistemological terrain. Marx's concern for emancipatory politics transcends the European origins of Marxism and makes it relevant to the human condition.

Thirdly, the same critique that queries the spatial setting of a theory should logically be extended to the location of the practitioner of that theory. Location not in the sense of socio-economic structures, but in terms of particular theoretical traditions. Elitist intellectuals theorising their own societies from positions of distance are as far removed from the experiences of their people as are theorists in the West. Is the alternative to Western theory indigenous social science? Do we assume that one is able to theorise one's own society in a better way? The link is tenuous at best. When we get theories that pay little reference to class struggles in their own societies, that do not

take into account oppression, inequality, exploitation, all we get is theory alienated from its context. Two implications follow.

First, the privileging of an indigenous social science, where national boundaries are used to mark off intellectual boundaries, reinforces nationalist mythology at a time when nationalism is being de-fetishised as an artificial construct by poets, litterateurs and activists. When a social science project defines itself against a metropolitan one, then the central contradiction becomes national vs imperial displacing the central contradiction between capital and labour. The location of intellectuals waging war on all received concepts needs to be enquired into very carefully, before we accept indigenous theory as authentic, in terms of setting intellectual and political agendas. It can be also dangerous, as Sarah Joseph has pointed out, when it lapses into attacks on socialism, secularism and other 'universal' principles as Western and pseudo.

The other point that makes me uneasy is the following: I wonder whether by postulating a specific social science, these practitioners are not opting out of theoretical engagement with hegemonic social science altogether. Niches have been secured for 'exotic theory' coming from the so-called Third World and the process of the consolidation of a hegemonic project continues. This is indeed reverse Orientalism with a vengeance, with the difference that now it emanates from the post-colonial world. Epistemological terrains are shifted not through placement of the interrogator in other cultures, but through the process of an immanent critique, i.e., through the thematisation of the normative structures of the theory that should inform social and political practices, and through an examination of the impediments that impede the realisation of those norms. Maybe we ought to re-read Marx's critique of classical political economy to see how this can be done, if we do not want to throw out certain very precious babies with the (cultural) bath-water.

Vol XXVI Nos 22 and 23

June 1-8, 1991

Worm's Eye View

Studies of colonial power have mostly focused on the macro-structure. Useful as these studies are, analysis of the architecture of colonial power will remain incomplete unless it is sensitised to the process of its constitution at the micro-social level, in the everyday life and mundane actions of ordinary people, below the overarching framework of the colonial state. 1399

Pilgrim as Cartographer

Though data-collection in social anthropology may seem to be a mechanical work of skill, each of its steps is conditioned by the paradigmatic axis occupied by the ethnographer. Hence the distinction between anthropologist as pilgrim and as cartographer. 1408

Prescription for Misery

Opening up the economy to international capital and competition is not the solution to India's economic problems. It is a solution which has a powerful appeal to the affluent 100 million Indians, but it is also a solution which will lead to external bankruptcy, sudden deep recession (and consequent unemployment) and misery to the rest of the 750 million Indians. 1369

Flawed Win

The Nepali Congress has won a convincing majority in the recent parliamentary elections, but its near-total debacle in the Kathmandu valley has rocked the party's collective leadership. 1375

Perverse Passions

Rajiv Gandhi's gory death is of a piece. This nation, if it can still be called that, is tearing itself apart and with a ghastly application of passion. 1373

More Than a Label?

Is the 'new world order' a euphemism for Pax Americana or a real attempt to reshape the world order towards a more equitable, more co-operative and more progressive system? 1389

NRI at Home

Non-resident Indians in business or service, while working in other countries, are second to none in efficiency, but in their own country they are usually frustrated by the 'too late, too little' syndrome. 1393

Slow Death

Seven girls have died of neglect in the last one year in the Maharashtra government's school for mentally retarded girls in Sarur, near Pune, the only such institution in the State. 1388

Expendable Tribals

The tribal village of Hadmatiya in Udaipur district in Rajasthan was the victim of a brutal police assault in April 1990. Eleven months later, in this March, the village was attacked again. These organised assaults reflect the social tensions generated by a process of development that has perpetuated the tribals' deprivation and dependence. 1379

The fate of the Koel karo project should be a lesson that the process of uprooting tribals in the name of development cannot continue for long. 1385

Women's Labour in Japan

What has been women's historical contribution to the industrialisation of Japan? How does Japanese capital elsewhere in Asia engage women to facilitate its international offensive? 1415

Poll Play

The influence of caste affiliation in the selection of candidates by the principal political parties in Bihar confirms that representative politics in the State has strengthened the caste system instead of weakening it. 1376

The sympathy wave that the assassination of Rajiv Gandhi is expected to generate is unlikely to reach the north east and, even if it does, is unlikely to substantially affect the voting pattern there. 1383

An aspect of election violence that has been ignored is the extent to which such violence is directed against the weaker sections of society and candidates who genuinely represent the aspirations of these sections. A case in point is the Karimnagar Lok Sabha constituency in Andhra Pradesh. 1378

Article 356

I HAVE read with interest S Guhan's rejoinder (May 11) to your editorial comment (April 6) on Article 356. I feel he should have paid more attention to the points at issue before getting 'dismayed' as he professes to have been. The very first paragraph of the comment nails down frequent misuses of the Article and demands that it must stop.

The main focus of the comment, as I understood it, is on the contradiction between the position of Jyoti Basu and M Karunanidhi who demand the abrogation of Article 356 and their comrades and colleagues who demand the dismissal of the Chautala government, obviously under the same Article. Guhan has chosen to overlook this discordance between the spokespersons of the same camp and, indeed, of the same party. Guhan's analogy between Chandra Shekhar and Chautala does not hold at all: while Chandra Shekhar himself tendered his resignation, Chautala refused to do so even when asked by the governor in so many words.

The points at issue arising from this imbroglio is whether the president on his own can dismiss an incumbent cabinet. The present Indian Constitution does not give this power to the president in relation to the Union government, though he has the same powers *vis-a-vis* State governments. Apart from many political and constitutional justifications for this provision that one can cite in a longer article, one submits only one paramount justification for this, namely, in view of the multiplicity of parties with diverse, sometimes perverse, political inclinations coming to hold office in different States, it is vital for the security and well-being of the people to give the president this power; otherwise there is no remedy to a situation when a State government having come to office (possibly with less than a plurality of mass votes) encourages or overlooks violent attacks on a community of people, apart from many other conceivable contingencies.

Guhan's abstract declamation about the sovereignty of the people and their representation both in parliament and the State legislature is without substance. Unlike some other historical cases, in India power was not secured by the people by asserting their sovereignty, but was handed over by the British rulers to their chosen Indian leaders and a handpicked Constituent Assembly who subsequently framed and adopted a Constitution largely modelled on the British parliament's Government of India Act of 1935.

The statement that opposition to the demand of self-determination of the States implies the Centre's right to dismiss a delinquent State government on proven charges of misdeeds is not exactly the same thing as Guhan's citation of it that "you have also suggested that unless the Centre has the powers to dismiss State governments, self-determination might have to be yielded to the States".

You had correctly said that in the case of any mala fide or misconceived use of Article 356 by the Centre, "public opinion will have to take care of that and force the Centre to make amends as was done once in the case of Andhra Pradesh".

Tribals Protest against Subarnarekha Dam

MAY 13 was not an ordinary day for the town Chaibasa in the Singhbhum district of Bihar. Although various political parties were organising rallies, meetings in support of their candidates in the forthcoming general elections, on this day this town witnessed a different rally. This rally was organised against the arrest of social activist, Kumar Chandra Mardi, and 450 tribals when they protested against the destructive development project, the Subarnarekha dam. Despite police repression, a crowd of 700 people, majority of them women and children, turned up in this town to protest against their threatened displacement due to the upcoming Subarnarekha dam at Icha which has been

cleared by the Planning Commission and Ministry of Environment.

The response of the local administration to the rally was negative. The authorities curtailed the people's participation in the rally by seizing all the vehicles coming from the villages. Thus all those who attended the rally travelled by foot at least 20 km in the scorching heat. A large procession was carried out in the town condemning the police arrest and shouting slogans. As the procession went past the local jail where many of arrested people were still lodged, the arrested people also raised slogans in the jail. The procession culminated at the Gandhi Maidan where a public meeting was organised. This meeting was addressed by many grassroots action groups and human rights groups and movements from the country. They include Narmada Bachao Andolan, Chatra Yuva Sangharsh Vahini, Bhartiya Jan Andolan, Visthapit Mukti Morcha, All Jharkhand Students Union, Kolhan Raksha Sangh, Lalmatia Bachao Andolan and Lok Jagrit Kendra. All the speakers condemned the illegal arrest of tribals and demanded their immediate release. They also criticised the State government for going ahead with the project without seeking the permission of the affected people whose livelihood is at stake. The people took a pledge to fight against the Subarnarekha dam project which is being carried out in the name of development to satisfy big industries and elitist consumerism.

Dubious Exercise

OSTENSIBLY prepared "at the suggestion of the government of India", a World Bank document, *Strategy for Trade Reform, India*, has been making the rounds for the past some weeks. The document is supposed to have reviewed recent trends in India's external trade and related macro-economic policies and suggested a strategy of trade reform backed by appropriate macro-economic policy measures.

On the basis of econometric simulation exercises, the World Bank comes to the conclusion that economic liberalisation in India in the 80s led to an accelerated growth of manufacturing output and exports. However, it exonerates altogether the liberalisation of imports of all blame for the worsening of the country's balance of payments position. To quote "Econometric simulation experiments reveal that this [deterioration of the balance of payments] was largely the consequence of inconsistent macro-economic policies, specifically the appreciation of the exchange rate in the early 1980s and the rapid growth of domestic demand led by the growing fiscal deficit fuelled by the growth in government consumption expenditures".

It is not clear what exactly was the sort of information that was fed into the econometric experiments to have yielded the sort of results mentioned, but serious doubts do arise about the objectivity and veracity of these reported exercises. For, if there is one single factor that has caused the imbalance in the country's payments position, it is none other than the enormous escalation in imports, an escalation that cannot be explained by either the exchange rate or the fiscal policy changes during the period. In fact the worst phase of trade and current account gaps was witnessed only during the second half of the 80s when exchange depreciation was rapid (between 1985 and 1990 the depreciation of the rupee against the SDR was of the order of over 70 per cent). Also, the budgetary deficit as a proportion of GDP during this period was only marginally higher than in the first half of the decade. One is left with the strong impression, at the end, that the World Bank exercise was meant to take advantage of the country's difficult payments position to foist its own well known package of policy measures on the Indian government and the so-called econometric simulation experiments were a mere facade.

The package of trade reform measures which the World Bank envisages for India, whether it is carried through in two phases or at one go, concentrates particularly on freeing the import of capital and intermediate goods. If it is to be implemented in two phases, then the proposed reform programme would first eliminate non-tariff barriers (QRs) on capital and intermediate goods and reduce the average tariff on them to 30 per cent, if it is to be implemented straightaway, then the programme envisages eliminating all QRs and reducing the average tariff rate to 20 per cent. Under the phased scenario, the World Bank acknowledges, a short-term decline could take place of almost 6 per cent in output of capital goods and of 2 per cent in that of intermediate goods, the decline in output is estimated at twice as much for capital goods and thrice as much for intermediate

goods if the programme is taken up for immediate implementation. The World Bank is quite explicit that the capital and intermediate goods sectors will be adversely affected by the reform measures it proposes. Nor are any tears wasted on the sub-sectors likely to be hit the hardest, e.g. machinery, metals and chemicals, because "these sub-sectors have the greatest inefficiencies and are more protected by the existing trade regime", as the World Bank document puts it.

Let us now see what the proposed trade reform package implies for the structure of the country's economy. The capital goods sub-sector has, as the World Bank itself notes, played a central role in India's industrial development policy which "identified the sub-sector as strategic for economic self-sufficiency" and by the beginning of the 1980s "India had reached a self-sufficiency rate of 85 per cent", measured as the percentage of total investment in machinery and equipment not met out of capital goods imports. However, after the government decided to dilute its policy of planned industrialisation and to go in for the so-called liberalisation in the late 1970s, capital goods imports have been on the increase. Indeed, not only has capital goods import increased markedly as a proportion of the country's total import bill (the increase was from 15 per cent in 1980-81 to 25 per cent in 1989-90) but also the increase in annual capital goods imports during this period accounted for almost 87 per cent of the trade deficit in the terminal year. It should also be noted that capital goods imports more than doubled during a period of four years, 1986-87 to 1989-90. Of course, during same period other non-bulk imports increased by two-and-a-half times and these are mainly raw materials and components, almost half of them supposed to be export-related items and the other half accounted for by all manner of new industries catering to upper class consumerism which came up in the 80s. So what we are facing today is nothing but the direct consequence of the liberalisation policies pursued over the past 10-15 years, particularly since the mid-80s. The World Bank is being less than honest when it asserts that "relaxation of import controls has not been responsible for the deterioration of India's balance of payments during the 80s".

Far worse is the Bank's attempt to force on the country a package of measures which is a total reversal of its industrial policy of attaining self-sufficiency in certain critical areas, particularly in the capital goods sector. Indeed the Bank's own calculations clearly show that our capital goods sector will not only not expand if the reform package is accepted for implementation, but will in fact start declining, possibly much faster than the Bank has reluctantly conceded. It has to be remembered in this context that the Indian capital goods industry has been able to keep its head above water, particularly in the mechanical and electrical and allied fields, under very difficult conditions (some of which though may have been self-inflicted). But once the industry is exposed to the penetration of imports on a scale even larger than in the recent past, as the Bank's reform programme clearly envisages, the decline is bound to be precipitous.

Shades of 1984

THE hunger strike undertaken by N T Rama Rao to protest against the damage to property in Hyderabad in the immediate aftermath of Rajiv Gandhi's assassination is certainly a well timed theatrical gesture aimed at generating political support for the Telugu Desam Party (TDP), just as the Congress(I)'s engineering of the post-assassination violence was an equally well orchestrated move to seize the political initiative by physical intimidating the opposition. Within three hours of Rajiv Gandhi's killing, according to reports, truck-loads of people led by Sudhir Kumar, son of Shiv Shankar, and M Mukesh, both Congress(I) MLAs, went about damaging property, particularly that belonging to TDP members. Since, for example, cinema halls belonging to N T Rama Rao were destroyed or damaged while those belonging to T Subba Rami Reddy, a Congress(I) functionary, were left untouched, suspicion must automatically fall on the Congress even if Sudhir Kumar's claims of innocence are accepted.

Through all the violence the police appears to have done nothing and, as if to legitimise this inaction, for a full week thereafter the police failed to book a single case. And to sanction this apathy, chief minister N Janardhan Reddy claimed on May 23 that he had only 'heard' of the attacks on property. It took a memo from the director general of police to the Hyderabad police commissioner seeking an account of the action taken against the offenders before the police began to move.

Rama Rao's fast in support of the demand for full compensation for those whose property had been damaged and arrest of the culprits including Congress(I) leaders has seriously embarrassed the Janardhan Reddy government. The cabinet initially dismissed the demand for full compensation as being unreasonable and one that would set a 'bad precedent', while the issue of arresting the guilty was deemed to have been automatically taken care of by the setting up of the judicial commission to inquire into the violence, which was announced on May 29, i.e., seven days after the violence began. But as the fast continued and a team of doctors described Rama Rao's condition as 'deteriorating', the State government found itself in a quandary. With Rama Rao all set to extract the maximum mileage, the government was compelled to be seen to doing something without at the same time conceding the demands.

But even in its attempt to call Rama Rao's bluff the government quite clearly

bungled. Having accused him on the charge of attempting suicide, the government mysteriously announced his release on bail whereupon the doctors in the intensive care unit of Nizam's Institute of Medical Sciences refused to force-feed him. This compelled the government to change its mind and announce that he was still under arrest.

Whether or not any benefit accrues to the TDP on account of Rama Rao's histrionics, it is clear that the violence and the attention drawn to the Congress(I)'s role in it will have gone some way in arresting whatever incipient sympathy wave was building up. The government's lack of sincerity in the little it has done by way of corrective action is quite obvious. All that has eventually resulted is the institution of a commission of inquiry. If the fate of the earlier commission investigating the December 1990 communal riots in Hyderabad is anything to go by, judicial commission now set up is very likely to achieve nothing.

CAPITAL FLIGHT Swiss Collusion

THE Swiss embassy in Delhi has recently come out with a statement defending the country's banking system against charges that it protected 'anonymous' deposits through 'numbered accounts'. The embassy's attempts at clarifying the mysteries of one of the most well kept secrets of international underhand transactions are laudable, particularly at a time when the Bofors scandal in India has set off inquiries into its Swiss bank connections. But the clarifications are far from satisfactory.

The embassy statement (which came in the wake of some press reports about changes in Swiss banking laws) makes it clear that the "well known principle of privacy in financial matters" still remains firmly entrenched. The change that has been made—not by any legislation, but by a decision "taken by the Swiss federal banking commission"—merely makes it obligatory for the lawyer or notary who places funds of a client in a Swiss bank to disclose the identity of the client. The name of the client will be known to selected members of the bank management only. Under the prevalent norms of 'banking secrecy', Swiss banks, the embassy statement makes it clear, may not "divulge to third parties any data connected with clients and their banking transactions, unless the client himself or a competent authority acting in public interest has ordered the bank to do so".

Thus, the Swiss banks continue to maintain the secret arrangements with

their clients which prevent the unearthing of criminal proceedings against illegal transfer of funds from Third World countries to these banks. Switzerland has provided the safest haven for flight capital, with its banks offering shelter for the rich who want to evade taxes. According to one estimate, privately owned funds transferred to Switzerland from the Third World are estimated at 250 billion Swiss francs (US \$ 160 billion). This constitutes a quarter of the total amount of flight capital from the Third World, the rest presumably getting transferred in the form of secret dealings in countries such as Panama, the Cayman Islands and Luxembourg, where laws are less stringent. The major part of these privately-owned assets in the Swiss banks consist of fugitive funds (guilty of tax evasion or currency offences). Apart from providing the corrupt elite of Third World countries with a sort of life insurance in the form of these accounts abroad, the Swiss banks are doing their bit along with their Western compatriots to contributing to the increasing poverty of the population of the Third World. For, the debt crisis of the Third World is caused to a large extent by the flight of funds. According to an estimate made by Swiss NGOs, roughly half the amount of the accumulated debt of Third World countries has been transferred to foreign bank accounts which are privately owned.

While the Swiss banks protect the Third World elite, the banks themselves are protected by Swiss legislation. Swiss laws admit the acceptance of funds that may be fraudulently transferred from abroad. It is left to a voluntary agreement by the banks to take precautions. Even after funds of criminal origin are detected, Switzerland rarely grants international legal assistance for prosecution. Several conventions of the Council of Europe for the prevention of the flight of capital have not yet been signed by Switzerland. The dispute over the accounts kept by the Filipino dictator Marcos, as well as, nearer home, our futile inquiries about similar secret accounts retained in Swiss banks by Indians involved in the Bofors scandal go to show that Swiss banks and lawyers can delay procedures of legal prosecution thanks to the unlimited possibilities of appeal (by their clients) granted under Swiss legislation.

Two Swiss NGOs—the Erklarung von Bern (Declaration of Berne Group) and Aktion Finanzplatz Schweiz-Dritte Welt (Action Group Financial Centre, Switzerland-Third World)—have started a campaign demanding changes in Swiss laws to put an end to the nefarious practice of depositing fugitive funds from abroad in secret accounts in Swiss banks,

They are demanding a streamlining of the existing laws so that legal procedures in relation to such accounts do not take longer than six months and the right to appeal is restricted. They also want the banks to be bound by laws that take into account illegal flight of capital from abroad as well as changes in the banking system so that financial statements are published by the banks with regard to major transactions and administration of assets, including a list of the countries of origin of the administered assets

ELECTIONS

Avoidable Contretemps

IN keeping with its by now well established penchant for acting in excess of its competence, the Election Commission (EC) has countermanded elections to the Patna and Purnea parliamentary constituencies in Bihar. In the 33 other Lok Sabha constituencies in Bihar where elections were completed in the first round of polling, the commission has ordered repolling in 600 polling booths. Questions about the propriety of the commission's action and hence the credibility of its motives have been raised by the violation of the prescribed procedural norms.

Unquestionably, the EC is empowered to countermand elections. But in this particular instance the EC has proceeded unilaterally and, it is now evident, without the benefit of substantiating proof provided by agencies officially charged with doing so. Further, it has not escaped attention that only two constituencies in a State—or for that matter an entire belt covering several States—that has developed more and more innovative methods of rigging elections have been singled out for drastic action.

It is the EC's claim in its letter to the State election office that the decision to countermand the elections in Patna and Purnea was based on the reports received from the State government, the chief electoral officers, the returning officers and the observers. But the Bihar government has clarified that neither was its opinion sought nor had it submitted any report recommending countermanding of the polls. According to the State chief secretary, Kamla Prasad, the returning officer in Patna had suggested repolling in only 26 booths. The chief electoral officers had not submitted adverse reports while the central observers deputed by the EC had in fact expressed their 'satisfaction' with the conduct of the poll. Even the Congress(I) and the BJP had requested repoll in only 50 to 60 booths.

On the other hand, reports of wide-

Gopalganj, Siwan, Ranchi, Arrah and Jehanabad, but the EC's enthusiasm for curbing electoral malpractices does not appear to have extended to these constituencies. Arrah, which returned an IPF nominee to the ninth Lok Sabha, is reported to have been virtually overrun by the henchmen of Suraj Deo Singh, the Dhanbad Mafia chief and acknowledged crony of prime minister Chandra Shekhar, and by 'shiksha' mafia chief Ram Lakhan Singh Yadav's supporters.

The moves by the EC seem of a piece with its earlier conduct on the Home Guards issue. On that occasion too it chose to set itself above the Constitution and abrogate what little federalism still obtains under it. Law and order and deployment of the police and other forces are explicitly State subjects, but the EC chose to forbid the use of Home Guards by the Bihar government for security duties for the elections. What has lent an added edge of controversy to the EC's actions and decisions is the peculiar circumstances of the Chief Election Commissioner's appointment to the post and the fact that he has not tried particularly hard to conceal his own political preferences.

HEALTH

Farce of Drug Control

FOR sometime now, an ayurvedic drug called 'Select', which the manufacturers claim can alter the sex of the foetus, has been marketed openly. The manufacturers have given little evidence of the drug's efficacy nor of any trials which have been conducted. And yet the drug had been licensed for production by the drug control authorities. Sometime back the government withdrew permission for the manufacture of the drug but, as usual, did nothing to stop its actual sale. As has been pointed out for other drugs which have received such treatment, there can be no reason for allowing the sale of a drug which has been banned either for lack of proof of efficacy or because it has been held to be hazardous or for any other reason which the authorities have been fit to accept.

'Select' continues to be sold on the basis of marketing literature for medical professionals which contains claims such as that "it supports family planning", it contributes to "social reform of dowry system—in case of more girls in the society", it "protects women's health by preventing frequent pregnancies", it "gives satisfaction and fulfilment of lasting desire to the couple in having a male issue" because "in the absence of a son, the family's dynasty comes to a close".

parents crave for a male issue".

While the licensing, safety and efficacy of ayurvedic drugs has been a contentious issue for sometime now, surely there can be no two opinions about preventing this sort of drug-pushing?

BANGLADESH

Inevitable Intrusion

THE arrival of the US marines to facilitate relief operations in Bangladesh has, not surprisingly, given rise to protests both within Bangladesh and by the Indian government. This poses two questions: One whether, had it wanted to, Bangladesh was in a position to refuse the offer of manpower, even if clad in military uniform? Two, what could have been done to make such 'intervention', albeit for a particular purpose and for a short time, unnecessary?

With the deaths due to the cyclone now officially estimated to be 1,38,000, with some four million displaced and with the financial magnitude of the direct damage put at 300 crore taka, Bangladesh could hardly have been able to cope with the danger alone. Most importantly, several reports point to the fact that it was not only the material aid such as food, shelter, etc., which was urgently required, but also the administrative structures on the ground required to see that these were distributed where and when necessary. There have been several reports, too many to be ignored, of utter lack of organisation even to receive the material being sent to Bangladesh by various agencies, leave alone distribute them. Moreover, there is the question of transport, in a region where most or all roads have been wiped out and the geographical features have been rearranged, what is required is air transport. Bangladesh has only a depleted air strength of any kind, leave alone any multipurpose helicopters. And, most of all, there simply is no trained contingent within or outside the military to undertake the relief operations which are urgently required given that there have been widespread reports of increasing diarrhoea deaths and of starvation.

It is, of course, well within the realm of possibility that, despite the memorandum of understanding which has been made public, the arrival of the US task force in Bangladesh is attached to quite another set of agreements, technical, economic and political, which will make for a 'US foothold' in Bangladesh, as the Indian government has put it. But the point is, how could a country like Bangladesh have avoided this situation? India's contribution of Rs 10 crore, three

disasters and the promise of rice and Pakistan's similar offers, while they are no doubt badly needed can hardly make up of the lack of trained personnel in the cyclone ravaged areas. And the extent of SAARC help will probably be the release of the emergency rice quotas from the supplies set up recently.

There is obviously little that can be done to prevent or control cyclones. The solution lies in disaster preparedness and just how crucial this sort of planning is was in fact demonstrated in the recent cyclone. After the 1970 disaster, which is estimated to have caused even greater havoc than the present one, agencies working in these areas had put up cyclone shelters. The few that had been well-maintained and standing have served to save hundreds of lives. Each of these however, not only costs something like \$ 100,000 but requires close supervision during construction and good quality materials. An estimated 3,500 such structures are required. Conceivably Indian financial and technical know how can assist in evolving low cost appropriate models and in building them.

Clearly it is here that regional alliances can be of real value—in setting up mechanisms for making emergency assistance available at short notice which would include money, material and specialised and trained manpower. In addition, the cyclone disaster also points to the urgent need to view such resources as river waters more in terms of regional and not national interests. Flood control of the Ganga and the Brahmaputra in Bangladesh can be facilitated by resolving the long pending dispute over river waters between the two countries. Without the strengthening of mutually beneficial intra-regional links, third world countries like Bangladesh will always be a target of imperialist intervention in one guise or the other.

PAKISTAN

Press Pointers

LAST month prime minister Nawaz Sharif at a government-sponsored seminar on the media threatened that newspapers which sought to "sabotage" his efforts and continued to be "irresponsible and sensationalist" would have to face the withdrawal of all government advertisements. That the prime minister should think nothing of issuing such a threat is a comment on the fact that the Pakistani press is far from being 'free and independent' even in the limited sense in which these terms are used in India. At the same time, the fact that the prime minister's statement has led to a spate of criticism from the press is a sign that Sharif may not be able to make such comments with impunity in time to come.

Many commentators on the press, including some prominent newsmen have

admitted that Sharif wasn't completely off the mark with his criticism of the press but not for the reasons he based his comments on. Quite the opposite in fact. In a recent issue of *The Friday Times* they point out that there has been an increasing tendency for newspapers, especially the smaller ones, to become party or government mouthpieces. Together with this has been the other growing trend—of violence against presspersons. In March, for instance, a senior journalist of the *Dawn* group, Zafar Abbas, and his two brothers were mercilessly beaten up by goons of the Mobajir Quami Mohaz (MQM). They forced a 'boycott' of the newspaper by harassing its vendors, and distributors, leading to a temporary closing down of the paper because it could not give protection to its staff. The Sharif government limited itself to issuing telegrams to the Sindh government and sending flowers to Abbas. Publication was resumed only after a joint delegation of the Council of Newspapers Editors (CONE) and the All-Pakistan Newspapers Society (APNS) called on the MQM leader and reportedly arrived at an understanding. But even this was deliberately misreported by some newspapers as *Dawn* having apologised for its misdemeanours. Apparently violence against the press by political parties is on the increase and the government is happy not to intervene. Another phenomenon has been the spurt in newspapers which specialise in sensational, hot-selling and speculative reporting, some of the last of course being because of lack of reliable information from the government.

It is true that none of these are features of the Pakistani press exclusively. They are to be seen on the Indian press scene as well. The difference is that there is a substantial section of the 'responsible' press here which has matured as a 'free' press. This is especially true after the Emergency period. In Pakistan long years of muzzled existence has meant that the press has attracted little talent or interest. For another, it is likely that what is defined as 'interference with press freedom' may not be as rigid there as it is in, say, India.

In the meanwhile Sharif's comments have raised the question of whether there will be a reintroduction of curbs on the press. As *The Friday Times* editorial points out, this will hardly be to the advantage of Sharif. For one thing, a 'free' press is necessary to ensure the revival of democratic institutions—something which is necessary for the Sharif government if it has to maintain a posture independent of the army. Secondly, Sharif's liberalisation plans may well suffer in the absence of free access to all sorts of information which can be engendered by a 'free' press. Given this Nawaz Sharif will perhaps be looking over his shoulder when he next threatens the press with an advertisement squeeze.

TWENTY YEARS AGO

EPW, June 5, 1971

Watching the first reactions to his budget in parliament and outside, the finance minister can well argue that if, as some of his critics have averred, his tax proposals betrayed conventional thinking, much of the criticism of them has not been exactly distinguished for its freshness. One group of critics, with the spokesmen of the Leftist parties as usual vociferous, have taken the 'common man' line. It is a measure of how the finance minister has been on the whole sparing of the 'common man' this year that the proponents of this line have had to clutch at the excuse duty on maida. Whether or not this is a terrible blow at the 'common man', it is about time it was realised that no amount of soaking the 'rich' (where does one draw the line?) will yield resources on any scale necessary for development. The other line of criticism has been that the budget hits at saving and investment. This argument, again, can be carried too far. Of course, there has to be differential tax treatment of income spent and income saved. But beyond a point the erosion of the progressiveness of taxation implicit in the encouragement of saving must defeat the egalitarian ends of fiscal policy. The incentives which already exist are enough to make it possible for even those in the middle tax brackets to provide ample nest-eggs for themselves and their progeny, at the expense substantially of the government. In company taxation, encouraged by the advance indications of an upswing in corporate investment, the finance minister has in the budget moderated some of the so-called incentives available till now. The major criticism of these incentives was that they were sufficiently indiscriminating and, therefore, served to effect a more or less across-the-board lowering of the effective rate of corporate taxation to substantially below the nominal rates. However, the scaling down of the incentives proposed in the budget is equally indiscriminating and is, therefore, open to the same criticism of lack of selectivity.

★ ★ ★

In fact, this criticism is applicable not merely to the corporate taxation proposals but to the budget's tax measures as a whole. The Finance Minister does say in his budget speech that "fiscal policy is not a matter simply, or even primarily, of raising resources to meet the insatiable demands on the national exchequer", but what one misses in the budget is precisely the attempt to use fiscal instruments to selectively influence the level and direction of economic activity.

Higher Profit Despite Lower Sales

Kumaran Pola

COROMANDEL FERTILISERS' net sales were nominally down during the year ended September 30, 1990 to Rs 177.64 crore from Rs 192.63 crore during the preceding year. However, there was significant improvement in profitability as a result of various steps taken to raise efficiency in the fertiliser division and reduce losses in the cement division. The company achieved the doubling of operating profits to Rs 30.77 crore. The net loss of Rs 6.96 crore during 1988-89 was converted into a net profit of Rs 10.50 crore during the latest year.

Fertiliser production amounted to 3,61,246 tonnes in terms of nutrients N and P during 1989-90 compared to 3,26,732 tonnes in the preceding year. Sales of fertilisers were 3,59,720 tonnes as against 3,26,561 tonnes in the preceding year. In the cement division, the production of clinker was 7,24,447 tonnes in 1989-90 compared to 7,14,183 tonnes in the preceding year. The company sold 6,75,255 tonnes as against 7,58,790 tonnes in 1988-89 which included 58,000 tonnes in the levy category.

From a negative 3.29 per cent, the overall return on investment showed a substantial improvement to 5.13 per cent in 1989-90. Foremost among the factors contributing to this change was the improvement in the net profit margin on sales from a negative 3.59 per cent in 1988-89 to 5.91 per cent in the latest year. The company overcame the steep rise in the cost of inputs such as coal, bags and transportation. The assets utilisation ratio deteriorated from 0.91:1 in 1988-89 to 0.87:1 in 1989-90, but for which the return on investment could have worked out still higher. The company earned for its shareholders a return on owners' equity at 23.45 per cent compared to a negative 17.78 per cent in the preceding year.

The capital structure got tilted towards owned funds with the debt/equity ratio declining to 2.83:1 in 1989-90 from 3.80:1 in the preceding year. This was due to the fact that there were repayments of both short-term borrowings as also long-term borrowings on the one hand and addition to reserves and surplus through ploughback from the profits of the latest year. Although the current ratio declined from 4.45 in 1988-89 to 3 in 1989-90, the short-term liquidity position remained comfortable.

There was a funds-flow of Rs 30.65 crore during the year. The sources of funds consisted of increases in reserves and surpluses Rs 5.64 crore and in current liabilities and provisions Rs 9.30 crore. Decreases in various assets were the remaining sources of funds during the year: accounts receivables Rs 6.31 crore, cash and bank balances Rs 0.58 crore, miscellaneous current assets Rs 8.35 crore, investments Rs 0.27 crore and intangible assets by way of expenses not written off Rs 0.20 crore. The company utilised a major part of the funds to pay off short-term loans which decreased by Rs 19.87 crore. Long-term borrowings decreased by Rs 2.14 crore. The remaining uses of funds were increases in fixed assets by way of additions to plant and machinery Rs 0.47 crore and inventories Rs 8.18 crore.

The company entered into an agreement for the sale of the cement division to India Cements. The consideration had already been received and the effect of the sale would get reflected in the accounts of 1990-91.

HINDUSTAN DEVELOPMENT CORPORATION

Larger Sales

HINDUSTAN DEVELOPMENT CORPORATION's on net sales showed a 34 per cent growth on annualised basis during the year ended March 31, 1990 to Rs 237.22 crore. There were increases of similar order, i.e., 28 per cent in operating profits to Rs 28.27 crore and 33 per cent in net profits to Rs 12.60 crore. The company succeeded in keeping the expenses-to-sales ratio steady at 0.89:1 in 1989-90, the same as in the previous year, which explained the growth in profits. This was not converted into higher profitability ratios because of substantial additions/valuation of fixed assets during the year.

Therefore, the overall return on investment was marked down to 3.99 per cent in 1989-90 from 4.14 per cent in the preceding year. The turnover ratio (sales/assets) declined to 0.75:1 in 1989-90 from 0.78:1 in 1988-89. The net profit margin on sales too worsened marginally to 5.31 per cent from 5.33 per cent. However, the company could earn for its shareholders a higher return on owners' equity at 10.42 per cent compared to 9.30 per cent in the preceding year, mainly due

to the advantages of leverage as reflected in a higher debt/equity ratio. The borrowings of the company increased by almost Rs 60 crore during the year most of which were invested in land, building and plant and machinery. The borrowed funds pushed up the debt/equity ratio from 0.81:1 in 1988-89 to 1.15:1 in the latest year. The impressive spurt in operating profits, however, buoyed up the interest coverage ratio at 2.79 times compared to 2.20 times in the preceding year. The short-term liquidity remained comfortable with a higher current ratio of 2.52 compared to 2.11 in 1988-89.

The balance-sheet changes showed a funds-flow of Rs 97.40 crore during the year. The largest source of funds consisted of long-term borrowings in the form of convertible debentures issued during 1989-90 and bridge loans contracted. The other sources of funds were increases in share capital due to conversion of debentures into equity and rights issue Rs 1.95 crore, in reserves and surpluses due to ploughback of profits as also transfer of premium on conversion and on rights issue Rs 17.54 crore, and in current liabilities and provisions Rs 11.33 crore. Decrease in investments on the maturity and liquidation of Gujarat State loan and sale of the equity shares of Escorts held by the company aggregating Rs 8.18 crore were another source of funds during the year. The funds were used mainly to increase net fixed assets by Rs 49.59 crore, inventories by Rs 5.60 crore, receivables by Rs 8.29 crore, cash and bank balances by Rs 22.43 crore and miscellaneous current assets by Rs 10.46 crore. Decrease in short-term loans by Rs 1.01 crore represented another use of funds.

The company's composite steel plant being set up at Malanpur in Madhya Pradesh in the name of Madhya Pradesh Iron and Steel Company is proceeding as per schedule. The civil construction has started and orders for the main plant and machinery, both imported and indigenous, have been placed.

HDFC

Housing Catalyst

HOUSING DEVELOPMENT FINANCE CORPORATION's loan approvals rose to Rs 813.78 crore in 1990-91 from Rs 603.03 crore in 1989-90. Loan disbursements went up from Rs 489.26 crore to Rs 668.49 crore. HDFC's cumulative loan approvals at the end of 1990-91 were Rs 2,903.13 crore and cumulative dis-

estimated that HDFC has made possible cumulative investment of Rs 6,011.33 crore in the housing sector.

HDFC's profit before tax for the year was Rs 38.81 crore compared to Rs 30.72 crore for the previous year. After providing Rs 9 crore for tax (previous year Rs 6 crore) and transferring Rs 24.07 crore to reserves (Rs 20.72 crore), the directors have recommended a dividend of 22 per cent (pro-rata for shares issued during the year). The dividend will absorb Rs 5.74 crore. Last year, the dividend declared was 20 per cent. Total income of the corporation in 1990-91 recorded an increase of 35.5 per cent, to Rs 263.41 crore from Rs 194.35 crore in the previous year.

During the year, the equity capital of the corporation was more than doubled to Rs 45 crore through both a rights issue and a public issue. Despite depressed market conditions, the public issue was over-subscribed 6.2 times. The shareholder base of HDFC has expanded from 46,000 shareholders to over 1,86,000 shareholders.

STOCK HOLDING CORPORATION Extended Operations

STOCK HOLDING CORPORATION OF INDIA (SHCIL) has reported encouraging results for the year ended March 31, 1991 and declared a maiden dividend of 10 per cent. During the year SHCIL handled record market operations of Rs 1,022 crore. Profit before depreciation was Rs 266 lakh as against Rs 53.52 lakh during the previous year. Profit after tax amounted to Rs 108 lakh as against Rs 16.29 lakh during the previous year. The corporation now has under custody about 4 million scrips.

With a view to gradually moving towards setting up of a Central Securities Depository, the government has now extended the services of the corporation to all the public sector banks, mutual funds and to the entire banking sector, including foreign banks and urban co-operative banks and private banks. Currently, talks are going on with foreign offshore funds also to utilise SHCIL. With the entry of offshore funds, the corporation will be widening its horizon into global custody. The corporation has also submitted to the government proposals for a legislation which, other than enabling Book Entry Transfer System in the securities industry, will ultimately enable the corporation to act as a Central Securities Depository and enable offshore funds which are listed under the SEC Regulations in the USA to entrust securities to the corporation in respect of Offshore Funds for custody. The impact of the legislation will be to

promote, clearing houses, depositories and issue houses who can be participants in the corporation.

To have the National Securities Transaction System operative, the corporation has been allotted a five acre plot by the government of Maharashtra near New Bombay where SHCIL proposes to build its modern depository. The corporation has embarked on a resources plan for inviting further equity from the new participants and for offering additional capital on rights basis to the existing shareholders.

JALAN FORGINGS Ready Market

JALAN FORGINGS is coming out with an issue of 19,00,000 equity shares of Rs 10 each at par aggregating Rs 190 lakh. An application to CCI has been made and the consent is awaited. Jalan Forgings, promoted by Gopal B Jalan and Anil Kumar S Jalan, was incorporated in September 1990. The company proposes to set up facilities to manufacture steel forged products at Kanjiri in Panchmahal district in Gujarat. It will produce open die steel forgings like straight shafts up to 400 mm dia and length up to 4 mtrs, forged rounds, gear blanks, die blocks and flats. These products find applications in core sector industries like power generation, steel, cement, sugar plants, railways, defence, nuclear and space projects. The company's project is estimated to cost Rs 493 lakh. The Gujarat Industrial and Investment Corporation and GSFC have sanctioned term loans of Rs 110 lakh and Rs 48 lakh respectively. GIIC is also actively considering equity participation, under the promoters' quota, to the extent of Rs 15 lakh and its sanction is expected shortly. The present annual demand of steel forgings in the country is 1,39,000

1,39,000 tonnes by 1993-94. The aggregate demand of open die forgings of 1.98 lakh tonnes by 1993-94, the supply is anticipated as 1.70 lakh tonnes leaving a shortfall of 0.28 lakh tonnes. This would necessitate creation of additional capacity to the tune of around 0.44 lakh tonnes by 1993-94. The company intends to produce about 6,300 tonnes of open die forgings against the anticipated shortfall of 0.28 lakh tonnes. It will therefore not be difficult for the company to find markets for its production.

BENZO PETROCHEMICALS Basic Chemicals Project

BENZO PETROCHEMICALS is establishing a project for the manufacturing of Benzaldehyde and benzyl alcohol. These are basic chemicals manufactured out of toluene and find usage in pharmaceuticals, dyes and perfumery industries. This will be the largest project of this kind in the country. The company has applied for permission to the Controller of Capital Issues for the issue of 35 lakh equity shares of Rs 10 each, out of which 21 lakh shares will be offered to the public. Promoters and their friends and associates have taken up 14 lakh shares. The total project cost as per the sanction by ICICI, IDBI and IFCI works out to Rs 700 lakh and would be financed out of equity shares of Rs 350 lakh and term loan of Rs 350 lakh.

Technochim Engineering of France is providing basic know-how, designs and drawings for the project. The company has acquired the manufacturing assets of Benzo Chem Combines at GIDC Estate Nandesari, Baroda, who are also the promoters of the company. The project is promoted by D C Gami, former managing director of Gujarat State Fertiliser Company.

India: Big World's View of 'Small World'

Arun Ghosh

Opening up the economy to international capital and competition is not the solution to India's economic problems. It is a solution which has a powerful appeal to the affluent 100 million Indians; it is also a solution which will lead to external bankruptcy, a sudden deep recession (and consequent unemployment) and misery to the rest of the 750 million Indians.

THE ECONOMIST of London has recently (May 4) come out with a survey of India's economic and political problems which, in the brief space of 16 pages, is in many ways not only revealing but devastating.

Unfortunately, the painstaking analysis of India's problems, by the economics editor Clive Crook, is flawed on two major counts. And since some Indian papers (notably *The Times of India*, New Delhi) have come out with glowing references to Crook's analysis, it is important that the record be put on the level, that the major flaws in the survey be exposed to the Indian intelligentsia generally, hoping that it will also attract the attention of at least some part of the international audience of *The Economist*.

Two points need to be emphasised at the outset. First, it is not being suggested here that the basic analysis of India's present problems, as presented in *The Economist*, is wrong; at worst, it presents only part of the picture, and that is a legitimate exercise for anybody who wishes to present a particular point of view. Secondly, and more importantly, it is never any use beating one's breasts about what might have happened if only India had adopted different policies from those actually pursued in the past. The only point of relevance—at least to Indians—is what policies should be adopted in order to get the country out of the morass into which it has got trapped.

First, one has to appreciate the immediate problems faced by the country. The fiscal deficit of the Central government last year exceeded 8.5 per cent of GDP. The latest estimates of the balance of payments are not available, but judging from the preliminary data on trade, the deficit may well have touched 4 per cent of the GDP. *The Economist* has lauded the overall growth rate achieved by the country during the period of Rajiv

Gandhi's tenure as prime minister, but apart from the fact that this growth rate was achieved largely at the cost of the fiscal and balance of payments deficits referred to earlier, several other disturbing trends have emerged. While India has achieved self sufficiency in foodgrains production, it is not realised that in many States and regions per capita availability of foodgrains has not increased since the fifties; indeed, the availability of pulses, the only source of protein for the poor, has gone down sharply. The overall growth rate of employment between 1983 and 1988 (as per the National Sample Survey) has increased by no more than 1.55 per cent per annum, when population has been growing at more than 2.1 per cent per annum. Thus, apart from the existence of underemployment and low productivity employment, open visible unemployment has increased, the NSS estimates being 6 per cent in rural areas and 9 per cent in urban areas. According to B S Minhas (former chairman of the NSS Governing Council, and Distinguished Scientist Emeritus at the Indian Statistical Institute), 42 per cent of the rural population of India was still below the poverty line as of 1987-88 (*vide* Chotu Ram Memorial Lecture, HAU, Hissar, February 1991). The growth of agriculture, though commendable, has been lopsided, only eight States accounting for more than 70 per cent of the people below the poverty line. Finally, one incidental result of the policy of liberalisation pursued by Rajiv Gandhi has been the proliferation of foreign collaboration arrangements for the manufacture of consumer items demanded by some 100 million (of India's present population of 850 million odd people), starting with the manufacture of potato chips (in collaboration with Zweifel of Switzerland), numerous soft drinks, junk (quick) foods, VCRs and VCPs, 'Barbie dolls' (and their appurtenances like dresses, bath-tubs et al), and in fact,

gadgets galore all of which require not only imported equipment but also continuing imports of components and raw materials.

According to *The Economist's* on figures, merchandise imports now are some 10 per cent of the GDP and exports some 4 per cent. (Actually, exports are nearer 6 per cent; rather, the gap between imports and exports is of the order of 4 per cent of the GDP.)

Against this background, *The Economist* feels that the only way to release the 'caged tiger' (i.e., India) would be the complete globalisation of the Indian economy, freeing of imports, making Indian industry face up to world competition, and attract foreign capital to make use of India's cheap labour for export production, for which apparently there are really no limits.

The problem that arises in this context is the total unrealism of the prescriptions, not because they are not possible to attain politically in India but because this is not the way the free market works. In fact Crook is perhaps unaware of the fact that India has (quite erroneously) been importing a lot of equipment from abroad against 'tied' aid programmes, when equivalent (sometimes better and even cheaper) equipment manufactured within India is available, but for which there is a shortage of domestic resources. Power generating equipment is but one example.

With the present skewed distribution of income, any 'freedom' of the type talked about in *The Economist* would immediately lead to a surge of foreign investment and foreign collaboration, not in areas where India may have export competitiveness but to serve a ready market for consumer goods required by a hundred million odd Indians who—by the writer's own admission—have access to large amounts of untaxed 'black' money.

And if this liberalisation process is to be sustained by general lending by international agencies (or even foreign capital inflow), the day of reckoning will come three or four years later when these debts would have to be repaid (or the capital investments serviced).

It would, of course, make sense if, like China, India were to freely allow foreign capital inflow on condition that there is always a favourable net balance of payments position, that is, if exports of the products manufactured were to exceed all import payments, whether for import of raw materials and components or payment of interest and profits. But that is

not the prescription

The analysis in *The Economist* is quite correct in regard to some of the consequences of the bureaucratic system of controls that we have managed to establish. The analysis is also correct in regard to the corruption of the body politic that the process has led to. Again, *The Economist* is quite correct in regard to the neglect of education, in particular of primary education, and the education of women, the neglect of health and sanitation and of the causes of the high infantile mortality rate, all of which have led to the high crude birth rate and the relentless growth of population, much of it underfed, suffering from malnutrition and disease. It would be idle to expect eight hours solid work from such an underfed population. *The Economist* is right in suggesting that India should spend more on the development of the 'human resource' and less on grandiose projects, both in industry and in other spheres, where a system of 'cut backs' has evolved to the detriment of efficient functioning of the industrial system but which successfully 'oils' the present system.

But, while *The Economist* cannot be faulted for the analysis of the maladies of the present system, its prescriptions are entirely inappropriate, coloured by the experience and prejudices of an economist hailing from the developed world, who (whether by oversight or by design) does not even refer to the potent obstacles to export from India to the developed world. The Multi Fibre Agreement is but one example. The US Super 301 another.

Nor does *The Economist* really go behind the economic miracle of countries like Japan and South Korea. All of them started with a minimum level of education for all and with a system of land distribution which, if not wholly egalitarian, was reasonably egalitarian. All of them went in for an export oriented industrial development but they controlled foreign collaboration very tightly (and do so even as of today). Import of technology is allowed after careful consideration with the build up of domestic R and D effort with adequate provision for the absorption, adaptation and development of technology.

The Economist's analysis is flawed in one other major respect. Most technology abroad today is labour saving and capital intensive. The type of opening up of the economy recommended would lead to a pattern of industrial investment which would *not* lead to large scale absorption of labour and the consequent growth of unemployment would lead to increased social tensions, increased divisive forces and a futile increase in government expenditure on forces for maintenance of

'internal security'

While the diagnosis of India's present ills made by *The Economist* are substantially correct, regrettably the remedies suggested are wholly wrong, arising from a lack of understanding of the basic problems of India's ailments and what needs to be done to overcome them.

II

What, then, needs to be done to solve the manifold problems which ail the Indian economy today? First, as indicated by *The Economist*, much of India's problem today stems from the large revenue deficit of the Central government, of the order of 8.5 per cent of GDP. This needs to be brought down sharply. True to tradition, *The Economist* has attacked the burgeoning subsidies given by the Centre, and the large investments made in industry by the Centre. The latter point is well taken. As to subsidies, many of them are not properly targeted—and worse, many of them are covert and not explicit—and it would in future be necessary to change their content and direction, but a reduction in the volume of subsidies may not occur. There are many other ways of reducing the budgetary deficit. *The Economist* does not speak of the unnecessarily large defence expenditure and the presently burgeoning expenditure on 'internal security'. The former goes to sustain employment in the developed world, and it is wholly unnecessary for the developing world to enter into a competitive arms race in order to protect employment in the arms industry, be it in Massachusetts or California. It is unfortunate that this signally wasteful expenditure does not evoke any comment from *The Economist*. (This, together with the focus on trade liberalisation to be discussed later, shows the major concern of the Western world.)

What we need in India today is an acceptance of the 'federal' principle, of democratic decentralisation, empowering the people to work out detailed local 'watershed area' development plans, to improve the moisture retention capacity of the soil, to evolve ways to retain the limited moisture that Nature bestows over a period of two to three months, by the construction of small weirs, check dams, ponds, et al. What is necessary is land levelling and reshaping and planting of grasses to prevent run off of the top soil with rain. What is required is the planting of trees to provide both fruit and timber (and fuel wood for the masses). What is required is larger use of organic fertilisers (easily available in most areas). What is required is better crop planning to suit the soil conditions in each area.

As indicated by *The Economist*, we need massive investments to improve the rural infrastructure. Roads are only one part of such infrastructure. There are others. What we need is a major shift in the pattern of investment in favour of the rural areas, but these—as per the Approach document for the Eighth Five Year Plan, released after approval of the NDC in October 1990—can be taken up efficiently and cost effectively only by democratically elected representatives of the local people, in each village, each mandal. There is need to instil the spirit of self-reliance in the people. The programme of local development must be worked out by the local people themselves, though they may need the assistance of experts.

The Economist spoke of the large subsidies being granted to food, fertilisers and other sectors, many of them being misdirected. That is true, though only partially. The fertiliser subsidy is partly to offset the higher cost of the feedstock (natural gas particularly, and also naphtha) as compared to, say, the opportunity cost of 'flared' associated natural gas in West Asia. Food subsidies need better targeting. It is, of course, true to say that both explicit and covert subsidies in the Indian economy are quite large. According to a study by Sudipto Mundle and Govinda Rao (see *Economic and Political Weekly*, May 4, 1991) total subsidies (as defined by them) may well be in excess of 14 per cent of GDP. In this context, *The Economist* is correct in stating that there is a wholly unnecessary subsidy on higher education as against primary education. That is all right, but the overall perspective the totality of approach of *The Economist* is *not* right.

We need a totally different pattern of subsidies. In fact, for most part, what are treated as subsidies today (for the rural sector) should really be converted into investments, by the deployment of unemployed and underemployed labour for local watershed area planning. We need, as *The Economist* says, to put in more funds for rural development. And, as a preliminary to that, we need to seriously think of the 'Right to Work', for at least eight hours daily at the *minimum wage*.
